A good batch of these plants raised from early summer sowings if taken up at this season, and potted and wintered in cold frames, will be found useful for a variety of purposes early in the spring. The Belvoir Castle Dwarf Yellow makes a capital pot plant, as does Covent Garden Blood-red as a dark-flowered one. The plants should be lifted with a reasonable amount of soil adhering to the roots, and firmly potted in 32's, in a mixture of sound loam, free from wire-worm and weevil-grub, and well-rotted manure. Let the plants stand on a firm bottom of coal-ash impervious to worms; they must not be allowed to get dry at the root, or many of the leaves will drop off. *M.*

MYOSOTIS IN VARIETY.

These may be similarly treated. The plants will be found of use where the greenhouse has to be kept gay in early spring. *Myosotis* should not be kept in a very moist house during the winter, and they should at all times receive as much fresh air as it is possible to afford them.

TOMATOS.

In order to secure an early crop of fruit, it is prudent to make a sowing this month, and to grow the plants steadily in a light position in a warm house, say, the earliest vinery, the plants remaining in the house, if a vinery, till a good set of fruit is secured, by which time the foliage of the Vines will have rendered their removal to a lighter house necessary. Tomato-seeds require but little water till germination has taken place; and when the young plants possess a pair of true leaves, they should be potted two in a 60-sized pot, but grown on singly at the next potting. A somewhat sandy compost is the best at the winter repotting, and the gardener should rather err on the side of small shifts, and a dryish state of the soil. The plants do best and grow sturdiest if kept near the roof-glass in a house having a temperature of 60°. As the days lengthen, the degree of warmth should be raised from 60° to 65°, and higher during sunshine. The plants should not be allowed to make lateral shoots, and repotting should be made finally into 10-inch pots, the soil made use of this time consisting of rich loam, mixed with spent Mushroom-bed manure, and mortar-rubble added. Trustworthy varieties are *Chemin Rouge*, *Ham Green Favourite*, and *Duke of York*. *H. Markham, Northdown, Margate.*

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Imantophyllums.—Afford these plants cool treatment, and keep the roots on the dry side, over-watering being apt to cause the tips of the foliage to become yellow, and eventually to die back to the root-stock. Seed of any particularly good varieties, if ripe, should be dried and sown in a pot or pan placed in a temperature of 60° to 65°. It is advisable to cultivate seedling *Imantophyllums* in an intermediate-house, as they will make greater progress there than in a greenhouse at this season.

Nerines.—Any bulbs which need re-potting may now be attended to. In the ordinary way annual re-potting is uncalled for; but top-dressing with rich soil should always be attended to yearly. A good potting-soil consists of sandy-loam three-parts, decayed dry cow-manure one-part, and coarse sand. When the bulbs are making growth, plenty of water is required; but during the rest-period, which extends from May to September, water ought to be withheld. The bulbs may be placed on a shelf in the greenhouse or similar structure for the present.

Hippeastrums.—By this date the latest bulbs will have completed their growth, and they may be stored away for a time to rest, being kept dry. A batch of the earliest-rested bulbs may have the old soil shaken

from them and be repotted, and placed in the forcing-house, plunging the pots if possible in a mild hot-bed; very little, if any, water will be required by the bulbs before they have grown a little.

Gloxinias and Tuberous Begonias, which have been dried off, should be shaken out of the old soil, and stored in dry Cocoa-fibre refuse in a dry shed that frost cannot enter; they will keep sound till potting-time comes round again. *Achimenes* may be similarly treated.

Lilium Harrisii.—The bulbs should be placed on a greenhouse shelf close to the glass when growth has fairly begun. Afford the bulbs water as soon as they are removed to the house, and do not allow the soil to get dry.

Mignonette.—These plants should be grown close to the glass, and air freely afforded when it does not freeze, the forwarder plants being stimulated with weak manure-water twice in a week or ten days.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford, Kent.

Conifers.—There are but few plants, if judiciously placed, which are as capable of adding to the attractiveness and charm of a garden as well-chosen Conifers. The choice of species should be guided by their hardiness, their ultimate dimensions, the sort of situation, whether sheltered or exposed, a wet or dry soil, and the nature of the last. Some Conifers are not particular as to soil, and will grow in any sort of pure sand; some succeed in swampy land, or on its margin, as for example *Sequoia sempervirens*, *Taxodium distichum*, *Pinus Strobus*, *Juniperus virginiana*. None, however, likes water stagnant always in the soil, and all or almost all are more at home on hillsides than flat land, or at least their effectiveness is greater. As a windbreak there is nothing better than the black Austrian Pine and *Pinus Pinaster*. But as most old gardens are usually well sheltered from the wind, and new ones can be afforded shelter in a few years, I will mention the names of a few species which are ornaments to any garden, assuming that proper stations are made for the trees, and there is some kind of surface-feeding or extension of root-run as time goes on, and the roots spread. The smallest station should not be less than 4 feet in diameter and 2½ feet deep. The preparations for planting are the same as for a fruit-tree minus the manure, and Conifers will not have any of that. The actual process of planting is the same if young plants without ball are employed, and even the knife may be used to reduce the number of leaders, or to produce a properly balanced head. The species to plant may consist of *Abies pungens*, *Picea excelsa*, the Norway Spruce, in its many varieties; *A. Menziesii*, *P. nigra*, *P. orientalis*, and *P. polita*. These are true Spruces (*Picea*). Then of Silver Firs (*Abies*), *A. amabilis*, *A. cephalonica*, *A. concolor*, *A. c. Lowiana* (*lasiocarpa*), *A. grandis*, *A. magnifica*, *A. Pissapo*, and *A. Webbiana*. The Hemlock Spruce (*Tsuga*) offer several fine garden trees, viz., *T. Albertiana*, the Columbian Hemlock; *T. canadensis*, and its variety; *Douglasii* (*Pseudo-tsuga*); and *T. Pattoniana*, *Araucaria imbricata* (where there is no chalk in the soil); *Cedrus atlantica*, *C. Deodara* in its varieties, *C. Libani*, *Cryptomeria japonica*, *C. j. elegans*, and *C. j. e. nana*; any of the Cypressess and *Juniperus*, and Cypress-like *Junipers*; *Larix Kämpferi* the Golden Larch, and *Libocedrus decurrens*. The genus *Pinus* does not offer so many garden trees of elegant form, but a few ought to be planted, if only for the beauty of their stem when aged, as the Stone Pine *P. pinea*, *P. sylvestris*, *P. Coulteri*, *P. insignis* (only in warm counties), *P. Jeffreyi*, *P. Sabiniana*, *P. Ayacahuite*, *P. Cembra*, *P. excelsa*, *P. Lambertiana*, and *P. Strobus*. Any of the *Thuias* are suitable garden-trees, and all very beautiful; as also *Thuiopsis borealis* in variety, *T. dolabrata* and its varieties, and *Sequoia gigantea*. These are enough for any garden of moderate size, as each will require ample space for its full development. The plants should be staked at the time of planting, and if planted on the turf no sods should be laid within 1 foot of the stem.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Selection of Plums for Gardens.—Some readers of the *Gardeners' Chronicle* may be glad to obtain a select list of Plums for garden planting. Early

Prolific (Rivers), Early Orleans,* Prince Englebert,* Denyer's Victoria,* Belle de Louvain, Denniston's Superb,* Kirkes,* Large Black Imperial, Common Greengage,* McLaughlin's Gage,* Jefferson,* Pond's Seedling, Washington,* White Magnum Bonum, Archduke, Monarch, Grand Duke, Golden Transparent Gage (Rivers),* Reine Claude de Comte Althann,* Oullin's Golden Gage,* Reine Claude de Bavay,* Rivers' Late Orange,* Coe's Golden Drop;* and for preserving and kitchen use, the small white and yellow fruited Mirabellas, which crop well as a standard. It is like a Damson in size and growth, but white or pale yellow. Those marked * are dessert varieties.

Plums may be trained in the fan-shape, and grown on east or west aspects, in districts that are not warm enough for the fruits to ripen on standards, bushes, &c. In the south most of the varieties do well as standard trees, but in the Midlands only occasionally are crops of fruit obtained in this way. The Victoria, Black Imperial, Jefferson, and Prince Englebert, are amongst the surest cropping varieties.

Selection of Cherries.—I will do for this fruit what I have done for Plums, namely, mention some select varieties of merit:—Elton, May Duke, Governor Wood, Early Rivers, Monstrueuse de Mezet, Bigarreau de Schrecken, Bigarreau Napoleon, Bigarreau Noir de Schmidt, Late Black Bigarreau, Géant de Hedelfingen, Reine Hortense, St. Margaret's, Guigne de Winkler, Morello, and Belle Magnifique, a red Morello. Cherries fail in some soils owing to lack of lime, a large quantity of which is removed by the stones of the fruit, and excepting on land overlying chalk or limestone, provision should be made for this at the time of planting, by incorporating finely-broken chalk or old plaster with the staple. A soil rich in nitrogen is also unsuitable for Cherries, as it fosters a too vigorous growth, and sets up gumming of the branches; and soil which has been highly manured should be removed from the sites of the trees, and be replaced with some sound loam from a pasture. The fan method of training is best for the Cherry, the single upright cordon suits the Bigarreau section, and the trees bear well for a few years, and can be made to cover a wall quickly by planting them at 2 feet apart. The early and mid-season varieties do well as standards, but cannot be grown in many parts of the country, owing to the partiality of the birds for the fruits. The Morello and Belle de Magnifique bear well in the bush-form if pruned annually, and they are then easily protected.

Planting.—Owing to the rains, the soil is in fine condition for transplanting all kinds of fruit-trees, and planting operations should be pushed on rapidly. No trees recently planted should be pruned, as this would only defeat the end in view—the production of roots; but all the leaves and points of branches should be preserved, and the trees securely fastened to one or three stakes, enough freedom being secured by loose tying to allow the soil and the tree to settle, a light mulching of half-decayed leaves or litter being spread over the roots at once. In planting trees in heavy soils do not make the bottom of the hole impervious to water by tramping it, although some degree of firming is very needful, and a small quantity of fresh soil should be afforded each tree, as this encourages the emission of roots, but manure should not be applied to young trees at first. In planting, all tap-roots should be shortened back, jagged ends cut smooth, and suckers removed. [It seems to us essential that standard trees should have the tap-root preserved, so as to afford stability against wind by anchoring the tree in the soil.—ED.] If the soil be wet it should not be trampled, but thrown in firmly with the spade and left to settle without being touched during the winter.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Seakale.—If the plants have been prepared as directed in a former Calendar of mine, the present will be a suitable time for forcing them in heat. Having dug them out of the ground with all their roots, putting these aside, and plant the trimmed roots if possible, trim off the long, slender "thongs," crowns pretty close together in wooden boxes or large pots, with some light soil firmly tacked in betwixt them, and place these in a dark room, cellar, or Mushroom-house, covering them with clean straw, and over all a garden-mat. The main things are perfect darkness, and a warmth of 55° to 60°. It is not advisable to force a large number of roots at

one time during this month, as Seakale forces much more rapidly in the true winter months. The thongs should be laid in for making sets at a later date. Other roots may be dug up, and after being prepared as described, they may be packed away in a sheltered place out-of-doors till they are required for forcing. It takes at this season from six to seven weeks to obtain blanched shoots.

Asparagus.—Asparagus roots may be forced in heated brick pits, or on hotbeds made up chiefly of Oak or Beech leaves to which stable-dung may be added, to ensure readier fermentation. Greater care is necessary with fermenting material than with hot-water heating, and those who have made a trial of both methods mostly prefer hot-water heating. What has to be avoided with leaves, &c., is the rapid rise of the warmth in mild weather, and its fall in cold; though this holds good of water-heated forcing-pits if care be not exercised, and the plunging thermometer in daily use. The soil in which the roots are to be planted should come up to within 8 inches of the glass, and when the roots are planted, not more than 12 inches will exist between the bed and the glass. The roots should be put close together, and covered with 6 inches layer of soil. At the finish, afford water if the soil be dry. Put on the sashes, and start with a steady top-heat of 50°, increasing it in a week or ten days to 60°, and afterwards to 65°. The bottom-heat should not exceed 75°.

Rhubarb.—Place more crowns in heat, and make sure that the first batch of roots is not suffering from dryness; and, if necessary, afford water at a temperature of 70°.

Tomatos.—Any fruits taken from out-of-door plants, and that have been ripened on shelves in a hothouse, may now be put into the fruit-room, or other cool place, till consumed.

Horse-radish.—The entire crop may be lifted this month, and a new plantation made, reserving the largest and best roots for use, laying them closely together in an out-of-doors border, under a slight covering of straw, so as to be easy of access in any weather.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorset.

Heat and Ventilation.—There are few matters connected with Orchid-culture that require greater care than the management of the heating-apparatus, and the ventilation of the houses during the winter months. For several months to come we shall have to depend entirely upon the heating-apparatus for the necessary warmth in the houses, so that heedless and improper stoking may become a source of constant anxiety and trouble. Excessive fire-heat is a frequent cause of deterioration in Orchids, therefore no more heat should be employed than is absolutely necessary. It is a great mistake and a waste of fuel to make up large fires in the early morning. The pipes then become hot, just when the outside temperature is advancing, and a dry and unpleasant atmosphere is produced in the houses, whilst the furnaces, being full of fire, are practically unmanageable. It is much better and more economical to raise the temperature by small sharp fires, and when the sun is felt warm in the houses, the fires being small, the fire-heat can quickly be reduced. Should there be insufficient heating-apparatus, and the proper temperatures cannot be maintained without making the pipes unduly hot, more heating surface should be provided during the present mild weather. During winter fresh air is quite as essential to Orchids as at any other time, even when there is only an hour or two of fine weather during the day, so that the opportunity of affording air should not be neglected. In mild weather plenty of air may with safety be admitted through the bottom ventilators, the top ventilators of the house should be opened slightly, there being less danger of the plants getting chilled. When very cold north or east winds prevail, it is best to keep the top lights closed, and to regulate the temperatures wholly by means of the lower ventilators, open those on the lee, or opposite side to the wind.

Shading.—All shadings should now be removed from houses having a north aspect and side lights, but houses facing south which contain such plants as Phalenopsis, Cyripediums, Angræcums, Vandas, Bolleas, Pescatoreas, Bulbophyllums, Cirrhopetalums, and the cool Orchids, must still be shaded during clear sunshine. A few sheets of tissue-paper will answer the purpose in many cases.

Plants in Flower.—As the pseudo-bulbs of the deciduous Calanthes are now fully grown, and the bloom-spikes are pushing up, a moderate amount of water must be afforded till all the flowers are expanded, when it may be gradually withheld. When the plants open their flowers, put them together in one part of the house where it is possible to keep their immediate surroundings somewhat dry. Numerous plants of Cattleya labiata are now in bloom, and the importance of removing the spikes and sheaths as soon as the flowers fade, should not be overlooked. After flowering, the plants should be arranged in a cool light position in the Cattleya-house, where air will circulate freely around them. When at rest much care is needed in affording water at the root. If the potting materials be kept constantly moist, it will cause the pseudo-bulbs to turn black and decay. Repotting or resurfacing may be done as soon as new roots are observed from the last made growths. Plants that have made their full complement of roots whilst in bloom, should be repotted in spring. Cattleya Gaskelliana is also rooting freely, and should be placed alongside the C. labiata, but do not repot them. Lælia Perrini, its variety alba, and the rare L. P. leucophæa when finished flowering will require a long rest, with but little root-moisture.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Pine-apples: Successions.—The growth of successional plants should be at this date completed for the season—the pine-pots will be filled with healthy roots, and the plants approaching full size; and to maintain them in this condition should be the sole aim of the gardener till the resting-season is passed. With this end in view, keep them rather dry at the roots, once a fortnight being as often as it is necessary to make an examination as to their condition as regards moisture in the soil. When it is apparent that water has become necessary, let enough be afforded in a tepid condition to moisten the entire mass. The temperature of the succession-house should range from 60° at night to 65° by day, with fire-heat alone, but with sun-heat 70° to 80°. The house must be damped down at least twice a day, and if much fire-heat is used, more frequently. Do not let the water touch the hot-water pipes when these are very warm, as it simply goes off in the form of vapour, which condenses on the glass and rafters, and forms dangerous drip. Let the house be ventilated in mild weather by opening the upper ventilators. Should the tan have contracted, and left the sides of the pots, press it closely around them, adding a little more fresh tan, so as to raise it to the height of the pots. This addition should not, however, be made if it is calculated to raise the bottom-heat, which should remain at 80°.

Suckers.—Those suckers which were potted in early September may be afforded a slight increase of top-heat, and be treated in all respects the same as the successions.

Fruiters.—In order to assist these, the bottom-heat may be increased a few degrees (90°), and the atmospheric moisture also; and close attention must be paid to their other requirements. Let no water be afforded any plant after the first trace of ripening is observed on the fruit. Such winter-fruiters as Smooth Cayenne, Black Jamaica, and Charlotte Rothschild, which are less prolific of suckers, should have their leaves shortened after the fruit is removed, so as to force the production of suckers; and if these come in some numbers, thin them out to two or three. The glass of all Pine-stoves should be clean and bright during the winter. Where tree-leaves are used for making hot-beds, the bulk of the Oak, Beech, and Chestnut should be got together under cover this month.

Winter Cucumbers.—The winter is not favourable to strong growth in Cucumber-plants, and everything possible should be done that will impart vigour to them. The stopping of the main shoots should be suspended, and strong young shoots trained in, but without crowding them; very weak ones, and the older leaves being removed. If the last top-dressing has become filled with roots, do not afford another; but add a little soil at the margin of the bed or hillock of soil, if there be space for it. Afford tepid-water when necessary, syringe the plants once a day in fine weather, and maintain moist, growing conditions. Let the temperatures range from 65° at night, to 70° by day with fire-heat, and 80° with sun-heat. Remove deformed fruits, and reduce the number of those left for consumption, so as not to over-tax the strength of the plants.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Nov. 14	National Chrysanthemum Society's Floral Committee meeting.
TUESDAY,	Nov. 15	Ulster Horticultural Society's Chrysanthemum Show at Belfast (2 days). Brighton and Sussex Horticultural Society's Chrysanthemum Show (2 days).
WEDNESDAY,	Nov. 16	Ancient Society of York Florists' Chrysanthemum Show (3 days). Buxton Chrysanthemum Show. Bristol Chrysanthemum Show (2 days). Hull Chrysanthemum Show (2 days). Ayrshire Horticultural and Agricultural Society's Winter Show at Ayr.
THURSDAY,	Nov. 17	Scottish Horticultural Society's Chrysanthemum Show, in Waverley Market, Edinburgh (3 days). Royal Botanical and Horticultural Society of Manchester Chrysanthemum Show, in St. James' Hall (3 days).
FRIDAY,	Nov. 18	Stockport Chrysanthemum Show (2 days).

SALES.

MONDAY,	Nov. 14	Dutch Bulbs, at Protheroe & Morris' Rooms. Unreserved Clearance Sale of Nursery Stock and Fruit Trees, at the Rutland Park Nurseries, Perry Hill, Catford, by order of Messrs. John Laing & Sons, by Protheroe & Morris (2 days).
TUESDAY,	Nov. 15	Dutch Bulbs, at Protheroe & Morris' Rooms. Dutch Bulbs at Protheroe & Morris' Rooms. Great Sale of Japanese Lilies and Palm Seeds, at Protheroe & Morris' Rooms.
WEDNESDAY,	Nov. 16	Unreserved Sale of Nursery Stock at the Shorthlands Nursery, Shortlands, by order of Mr. J. B. Bryant, by Protheroe & Morris.
THURSDAY,	Nov. 17	Dutch Bulbs at Protheroe & Morris' Rooms.
FRIDAY,	Nov. 18	Dutch Bulbs at Protheroe & Morris' Rooms. Orchids at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—42° 1'.

ACTUAL TEMPERATURES:—

LONDON.—November 9 (6 P.M.): Max., 60°; Min., 49°.
PROVINCES.—November 9 (6 P.M.): Max., 57°, Scilly;
Min., 44°, Aberdeen.
Dull, foggy, slight rain.

The Modern
Chrysanthemum.

IN this time of Chrysanthemum Carnival it may not be inopportune to draw attention to some points that are well known, though in general little thought of. Neither gardeners nor the general public adequately realise what an artificial product the exhibition Chrysanthemum really is. Our herbaria contain no evidence of the existence of such forms in Nature. Search the fields of Japan or China, and no such flower will be found. They are the issue not only of ordinary processes of cultivation on the part of the Oriental gardeners, but of special procedures of selection and suppression resulting in what is really a triumph of the gardeners' art. Our own cultivators have but copied and repeated the methods of the Japanese, and, so far as we know, have not devised any new method of procedure.

Like most other plants the Chrysanthemum, left to itself produces many more buds than it can bring to perfection. From the first, then, there is a struggle for existence, the weak or the ill-placed ones succumb; the strong ones, or those placed under more favourable conditions, survive and flourish. The result may be seen in an unpruned Chrysanthemum. The buds which have survived the natural suppression, develop into flowers tolerably uniform in size and colour. As a rule, no one is much greater or much more developed than another. The effect is beautiful: there is a proper balance between the foliage and the flowers; the number of blooms is considerable, though their size is as nothing compared to that of the exhibition specimens. The plant is grown naturally with the assistance indeed of art; but art is not called into play to thwart the natural mode of growth, but to foster and promote it.

With the huge exhibition-flowers the case is different. A particular bud is "taken"—that is, it is selected, and its rivals and competitors are suppressed. Sometimes it is a "crown-bud" that is taken, sometimes a "terminal bud," to use the phraseology of the growers, which in this matter is the opposite in point of significance to that employed by botanists. This selection of particular buds, which are not the same in different varieties, is very interesting. We earnestly hope that cultivators will not lose the opportunity of recording their observations as to the particular varieties that are best grown on from crown-buds or from terminal buds respectively. Perhaps in time we may get at "the reason why." If so, we may be sure that the knowledge will not only be of importance to the naturalist, but that it will possess special practical value, and obviate much guess-work and hap-hazard procedure. In the meantime, we note with interest the central fact that the buds which look so much alike have nevertheless different attributes. We speak of some things as being as like as peas in a pod, but when we come to look at the peas carefully, we find that the degree of resemblance between them is much less than a superficial glance reveals. They differ, of course, in position, those at the two ends of the pod are usually smaller, and have less room to expand. The supply of nourishment to them must be different in amount from that received by the peas in the centre, the processes of fertilisation may also well present some modifications, according to the position of the ovules; and so it happens, as all raisers know, that instead of being very much alike, the peas in a pod are often very different.

It is the same with the buds, whether of the Chrysanthemum or other plant. The buds on different parts of the plant are not all alike. Very often they are considerably different. The advantage to the plant of this diversity is obvious. A check during the growth of one set of buds is compensated for by the development of others. The variety in form and endowment goes to neutralise the excessive levelling down that occurs from the internecine struggles of competitors. The Chrysanthemum-grower, as we have said, avails himself of this diversity; he "takes" the bud he deems best for his purpose, and suppresses the rest. The result in a botanical sense is a monstrosity; but this term has, in ordinary language, an evil significance which the enthusiastic Chrysanthemum-grower would naturally resent, and the general public would endorse their view of the case. There is, happily, no anti-vivisection

society, no society for the prevention of cruelty to plants, and so the enthusiasts may continue their mutilations and suppressions without fear of police inquisition.

The modern Chrysanthemum is, as we have said, a work of art, and from that point of view it is also a triumph. *Floreat!*

LINNEAN SOCIETY.—An evening meeting will be held on Thursday, November 17, at 8 P.M., when the following papers will be read:—1, "On some Spiders from Chili and Peru," by F. O. PICKARD, Cambridge; 2, "The Botanical Results of a Journey into the Interior of Western Australia," by Mr. SPENCER MOORE, F.L.S.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are asked to state that the Committee have been obliged to remove the offices of the above Institution from 50, Parliament Street, to 175, Victoria Street, S.W., to which address, in future, all communications should be sent.

"THE KEW BULLETIN."—The Bulletin of Miscellaneous Information from the Royal Gardens, Kew, for November, contains Dr. A. Henry's very interesting and important Budget from Yunnan (continued); Notes on Insect Powders as made from Chrysanthemum roseum and *C. cinerariæ-folium*; Diagnoses Africanæ, XII.; an obituary notice of Dr. J. E. T. Aitchison; a note on the coloured drawings of Burmese Orchids made by the late Rev. C. L. P. Parish, and presented by his widow to Kew; and other items of interest.

M. MARCHAND, if he were not a naval officer, says the *Daily News*, might have been an eminent gardener. Wherever he planted the French flag, he planted a garden, and sowed edible vegetables. His Radishes, it appears, were a great success; so were his Cucumbers, Pumpkins, Lettuces, Spinach, and Sweet Potatoes. Vegetables almost sprang up in the course of a night in the Bahr-el-Ghazal; and at Fashoda, as is known, he was able to send a well-filled hamper from his garden to the Sirdar.

"BOTANICAL MAGAZINE."—The plants figured in the November number are *Astragalus ponticus*, Pallas, t. 7622, an erect villous herb, with narrow multijugate pinnate leaves, and close axillary heads of yellow papilionaceous flowers. It is a native of Asia Minor.

Kniphofia longicollis, Leichtlin (ex Baker, in *Gard. Chron.*, 1893, xiii., p. 682). This is like *K. aloides*, but has bright yellow flowers, without a tinge of red. It is a native of Natal, and flowered in the garden of W. E. Gumbleton, Esq., Queenstown.

Aloe leptophylla, N. E. Brown, t. 7624.—A fine-looking Aloe, with spotted leaves, coarsely and remotely toothed; flowers numerous, pendulous, in close umbels at the top of the spathe, each flower about 1½ inch long, orange-yellow tipped with green. Native of Cape Colony.

Podotheca chrysantha, Benth., t. 7625.—A straggling Composite herb, with scaberulous stems sessile, broadly linear leaves and terminal flower-heads, each about 1 to 1½ inch across; flowers yellow, with a long, slender, curved tube, and a regularly five-lobed limb. It is a native of Western Australia.

Calliandra fulgens, Hooker, t. 7626.—A Mexican shrub, with pilose, pari-pinnate leaves; pinnæ six, sub-sessile, lanceolate; flowers crimson, in heads. It is a Composite belonging to the tribe Ingeæ.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—The floral committee on the occasion of the meeting on October 12, 1898, awarded First class Certificates to Mr. T. E. Houtvester, of Utrecht, for Chrysanthemum President Nonin and Soleil d'Octobre; to Messrs. E. H. Krelage & Son, of Haarlem, for Cactus-Dahlia Hohenzollern, C.-D. Mary Service, C.-D. Mrs. Dickson, C.-D. True friend; to Mr. Egbert Kloosterhuis, of Veendam, for Populus trichocarpa, Pirus erythrocarya, Stephanandra Tanakae, Ulmus argentea albo-marginata; to Mr. C. Meynen, of Groningen, for Vriesea hybr. retroflexa ×

brachystachys. Certificates of Merit were also awarded to Messrs. E. H. Krelage & Son, of Haarlem, for Cactus-Dahlia Aegir, C.-D. Falka, C.-D. Island Queen, C.-D. Maid of Honour, C.-D. Mrs. John Goddard; to Mr. H. D. Willink van Collen, of Breukelen, for Iochroma Warscewiczii. A Gilt Medal was presented to Mr. J. Th. van den Berg, Jr., of Jutfaas, for a collection of cut flowers from Begonia tuberosa erecta gigantiflora duplex; and a Silver Medal to Mr. Joh. Wolfswinkel, of Enschede, for a collection of cut-flowers of Chrysanthemum.

HYACINTH GLASSES.—We read in the German gardening journals of an invention sold by the Gebrüder Streit's successor, which is a Hyacinth glass provided with a means, probably in the form of a spout or nozzle, by which the glass can be emptied or filled with water, without in any way disturbing the bulb.

VEITCH'S PROLIFIC STRAWBERRY.—This fine Strawberry, it will be remembered, is the result of a cross between Empress of India and British Queen, and was figured in our columns July 30, 1898. It is recorded in the current number of the *Revue Horticole* that a Strawberry having an "astonishing resemblance" to Veitch's Prolific in all particulars has been raised as a cross from Dr. Morère by General Chanzy.

M. PATRY, the head gardener of the Jardin d'Acclimation in Paris, a very clever cultivator, has resigned his situation; and is succeeded by M. PERROT, hitherto head gardener at the Botanical Gardens, Marseilles.

THE HOLY LAND.—Mr. J. GILBERT BAKER, F.R.S., has consented to give a lecture on "The Botany and Physical Geography of the Holy Land," at the Westminster Meeting House, 52, St. Martin's Lane, London, on Third-day, the 22nd of Eleventh Month, 1898, at 7 o'clock. The chair will be taken by ALFRED WILLIAM BENNETT, M.A.

CORNISH DAFFODILS.—The *Cornish Magazine* for November opens with an illustrated paper by the Rev. GEO. ENGLEHEART on "The Daffodil in Cornwall." This county seems to rival the Scilly Isles in the Narcissus industry, soil and climate being both favourable for the purpose. Small growers have, probably, but little idea of the scale upon which Narcissus culture is carried out in certain localities specially devoted to the industry. Says Mr. ENGLEHEART: "For magnificence of these plants grown to perfection on a large scale, I have seen nothing to equal Mr. ANDREW LAWRY'S flower-farm in Mount's Bay. The view of acre upon acre of the silver Poeticus ornatus and the great waxen clusters of Grand Monarque, stretching under the brilliant blue sky of Cornwall far away towards the blue bay and the ancient mount of St. Michael, upstanding in the sunlight, would need the idyllic gift of a THEOCRITUS to describe worthily." From a purely economic point of view, Daffodil-culture is advancing in two directions—there is the ever-increasing quantity raised for the wholesale markets, and the "improved" and fancy varieties which tempt the money from pockets of specialists. It is evident that if the British farmer cannot grow Wheat profitably, there yet remain divers branches of agriculture or horticulture at which he has a chance of success, if he will strive to adapt himself to circumstances instead of allowing himself to be beaten by them.

RAINFALL AT ULLSWATER.—A correspondent writes that about 6 P.M. on November 1 a storm broke over Ullswater, and continued till 4 A.M. on November 3, during which time over 2½ inches of rain fell, which is the largest amount registered here for many years. The Ullswater lake rose about 4½ feet in the same time.

GARDENERS' ORPHAN FUND BAZAAR.—We are informed by circular that it is the intention of Mr. M. TODD, the president of the R.S.H.A., to hold, during the continuance of the Chrysanthemum Show on November 17, and the two following days, in the Waverley Market, Edinburgh, a stall under the

gallery at the west end of the market for the sale of plants, flowers, &c., for the benefit of the Gardeners' Orphan Fund. He offers likewise a number of valuable and attractive objects to be disposed of by subscription sale. Tickets are sixpence each. The drawing is to take place on Saturday evening at the close of the show.

STOCKTAKING: OCTOBER.—Notwithstanding all the rumours of war, and the naval and military preparations at home and elsewhere in the Empire, the Trade and Navigation Returns for the past month are, as things go, satisfactory, though the value of the imports have fallen, as compared with the same period last year, by over £440,000. The items in which a decrease is recorded, are living animals, for food; metals, chemicals, &c.; oils, raw materials for textile manufacture, manufactured articles, and miscellaneous articles. The total for October last year was £39,044,763; for last month £38,601,673. The following is our usual excerpt from the summary table:—

IMPORTS.	1897.	1898.	Difference.
	£	£	£
Total value ...	39,044,763	38,601,673	—443,090
(A.) Articles of food and drink—duty free ...	13,032,059	13,572,295	+540,236
(B.) Articles of food and drink—dutiable ...	3,166,814	3,182,481	+15,667
Raw materials for textile manufactures ...	4,517,481	3,729,088	—788,393
Raw materials for sundry industries and manufactures ...	5,241,185	5,445,353	+204,168
(A.) Miscellaneous articles ...	1,244,130	1,179,478	—64,652
(B.) Parcel Post ...	86,160	110,556	+24,396

We may note that Hops from the United States and elsewhere found their way here to the amount of £66,541, Clover and grass seed figured for £33,988, Rape was imported to the value of £51,467, pulp of wood was sent in to the value of £154,173, wood and timber foot up at £533,897, and we imported dried Currants and Raisins to the total value of £695,751, about equally divided between the two. And this naturally leads up to our usual table relating to fruits, roots, and vegetables, as follows:—

IMPORTS.	1897.	1898.	Difference.
Fruits, raw:—			
Apples ... bush.	457,447	634,027	+236,580
Cherries ... "
Grapes ... "	360,151	346,049	—14,102
Pears ... "	107,523	103,217	—4,308
Plums ... "	29,289	93,307	+64,018
Unenumerated ... "	119,816	203,177	+83,361
Onions ... "	710,701	748,348	+37,647
Potatoes ... cwt.	325,253	105,112	—220,141
Vegetables, raw, unenumerated ... value	£77,297	£119,373	+£42,076

It need scarcely be again observed that to those interested in the disposal of home produce, these figures are of great importance.

EXPORTS.

Other people besides ourselves engage in stock-taking. The Government Labour Department does this, and enumerated the other day the time lost in the various strikes, by which, since the beginning of the year, several millions of days have been lost. Last year it was the engineers who had the *pas*, this year the Welsh coal-getters have the greatest number of days lost placed to their "credit." Exports might have looked up much better to-day than they have done, but the returns show an increase of £579,967. The figures for October last are £19,863,019, against £19,283,052 for the same period in last year. The ten months just ended show a total of £192,592,177, against £195,274,228 in October, 1897. The items of increase are to be found under the headings of raw materials, £259,964; yarns and textile fabrics, £415,147; machinery and millwork, £504,323; the

largest decrease is in metals and articles manufactured therefrom, except machinery; articles of food and drink, and apparel and articles of personal use. It is interesting to note an export of butter, amounting to £4,983; of cheese, £4,742; sugar, refined and candy, sent from us to the value of £37,040. We are not sure that any great strike threatens; should things remain quiet in this direction, the deficit in exports may be set square by December 31.

PUBLICATIONS RECEIVED.—*Commerce* (Amberley House, Norfolk Street), Oct. 26.—*Newspaper Owner and Manager* (Electric Publishing Co., Woodgrange House, Forest Gate, E.), Nov. 2.—*Agricultural Economist* (Agar Street, Strand). This includes an article on "Blackberry Growing," as a "new" home industry; and one on "Succulent Plants," which is well illustrated.—*Agricultural Returns for 1898* (Board of Agriculture). Statistical tables, showing acreage under crops and grass, and number of horses, cattle, sheep, and pigs in the United Kingdom, with particulars for each county of Great Britain.—*Thirtieth Annual Report (for 1897) of the Flax Supply Association for the Improvement of the Culture of Flax in Ireland*. The season of 1897 was a very unfavourable one for Flax, owing to the prevalence of cold and wet weather. Another cause of failure was the want of judgment and care shown by many of the farmers.—*Nature Notes*, November.—*Bulletins of the Botanical Department, Jamaica*, May, June, July, and August, containing papers on Vine and Vine Culture, India-rubber, Insects in Cigars and in Grains and Peas, Bermuda Onions in Antigua, Synoptical List of Ferns, Diseases of Citrus Fruits, and (in the August number) Soil Inoculation and Tamarinds.—*Bulletin of Miscellaneous Information, Trinidad*, October, with papers and extracts on Vanilla, Preserving Lemons, and Cacao v. Chocolate.—*Agricultural Gazette of New South Wales*, August, contains articles on Tobacco Growing in New South Wales, Weight per Bushel of Australian Wheats, New Varieties of Sugar-cane at the Richmond River Farm, and Orchard, Vegetable, and Flower Notes.—*Manual of the Grasses of New South Wales*, by J. H. MAIDEN. The contents include chapters on the cultivation of Native Grasses, the conservation of Native Grasses, analyses of Grasses, Grasses for Special Purposes and Situations, Key to the Genera, List of Grasses, Descriptive Account of each Grass. The excellent illustrations are worthy of the text.—*Handbook of Insects Injurious to Orchard and Bush Fruits, with Means of Prevention and Remedy*, by Eleanor A. Ormerod (London: Simpkin Marshall, Hamilton, Kent & Co.).—*An Elementary Text-Book of Botany*, by Sydney H. Vines, D.Sc. (London: Swan, Sonnenschein & Co.).

HOME CORRESPONDENCE.

SPRAYING FRUIT-TREES.—On reading of the Canadian fruit-tree spraying experiments on p. 300 in the issue of the *Gardeners' Chronicle* for October 22, I find that the spraying-mixture was very similar to that which I made use of last winter and spring. This consisted of 3 oz. Paris Green, 2 lb. lime, 2 lb. sulphate of copper, and 40 gal. of water. This is a safe and effective receipt, and our trees are only sprayed with it twice, once before the flowers opened, and once after the fruit was set; but I had them sprayed twice later in the season with Bentley's quassia extract, which is, of course, non-poisonous to anything but insects; and I may add that our crop of Apples was very large in quantity, although owing to the drought some of them were very small. As serving to show the efficacy and necessity of spraying fruit-trees, we have two fair-sized trees of Blenheim Orange Pippin; one is in a paddock in which the garden-horse feeds, which, of course, was not sprayed, and, in consequence, bore no fruits; and the other was a few yards distant, an iron fence dividing them, was sprayed, and it produced a fair crop of good fruits. R. M., Newbury.

HEDGES OF GARDEN FLOWERS.—Some few years since, after planting out our usual quantity of Cactus and single Dahlias, I had a number of strong plants left over, and these I decided to plant in a

line round one of the kitchen garden quarters, which visitors have to pass on their way to the plant-houses. Not having any stakes on hand to stake them separately, they were secured to tall stout Pea-sticks, putting these on each side of the plants, just the same as Peas are supported. Dahlias were planted at about 6 feet apart in mixtures of the colours, still most of the available stock of the Cactus varieties were of the *D. Mariesii* type, a strong grower. Some tufts of Sweet Peas, Canary Creeper, tall-growing Tropæolums, and Convolvulus major were planted between the Dahlias, and by the end of the month of August the hedge presented a mass of flowers, and the Pea-sticks completely hidden from view. This hedge was much admired by those who saw it, and since that year I have always had a flower-hedge in some form or other, the planting being varied more or less each year. To-day several armfuls of Cactus Dahlias could be gathered from this year's hedge, as owing to the fine dry weather and absence of frosts, the plants are flowering later than usual. *H. J. C., Grimston, Tadcaster.*

HARDINESS OF SELAGINELLA DENTICULATA.—

On a sheltered grassy bank in the grounds at Grimston Park, there is to be found a large batch of the above plant, which has existed there for several years, and during that time has been exposed to some severe frosts. The bank is shaded by a large Wych Elm, and the position is, moreover, sheltered from the north blast by a large belt of forest trees. The soil is a stiff loam, and overlies the limestone rock. It is about seven years since my attention was drawn to it, when the workmen were raking up tree-leaves in February. I find it extends somewhat each year, and now forms quite a carpet of several square yards. In the conservatory at Grimston Park there are narrow boxes filled with this Selaginella to serve as margins to the groups of flowering and foliage plants on each side the central path, these boxes being annually replanted. My idea is, that the refuse soil has at some time been taken from the compost-heap and spread all out where the patch is now found. *H. J. C., Grimston Park Gardens, Tadcaster.*

THE PEAR MIDGE (DIPLOSI PYRIVORA).—

There is an interesting article on this insect in the last issue of the *Journal of the Board of Agriculture*, in which we find it stated that this insect was first described by Schmidberger in 1831 under the name of *Cecidomyia nigra*, and the digging of the ground under the infested trees, 4 inches deep, during the summer; also the application of kainit from the middle to the end of June, at the rate of 1 ton per acre, are recommended as remedial measures. There is little doubt as to the destructiveness of this insect, or that it is difficult to combat. I have searched the trees at Belvoir and elsewhere many times when in flower, and tried to entrap them, but have as yet never seen one, although the larvae are plentiful, and many of the trees here have lost almost every fruit. The article mentioned gives April 12 to 18 as the time at which egg-laying has been observed. It will repay the fruit-grower the time spent in studying it, and various other interesting papers in this number, including, as it does, articles on the "Strawberry Mildew," "Fungi on Tomatos," "Aphides," &c. *W. H. Divers.*

CROCUS SPECIOSUS.—One seldom finds this beautiful species in gardens, and rarely at its best. Mr. G. Nicholson describes it as "probably the handsomest autumn-flowering Crocus," and he is right. It appears to do well in any position, for I have it on a north aspect, where sunlight does not fall, and the plants bloom finely; but I get the best blooms from clumps under a west wall. The clumps have been there for years, they never fail to flower, and the clumps increase in size by the natural production of offsets. It should not be planted among plants which crowd it, as then the flower-stems are weak, and tall, and unable to bear the weight of the flowers. As in October, when the flowers are at their best, north winds are always experienced, protection of some kind should be afforded, such, for example, as a few sprays of Thuia, or other evergreen shrub. By placing a bell-glass over the buds just as they are showing colour, the flowers so protected come very fine indeed. The best time to lift and plant the corms is early summer. In planting, a hole 6 inches or a little more in depth should be made, and 2 to 3 inches of well-decayed manure put at the bottom of it; on this a layer of rich soil, and then the corms, filling up the hole with the ordinary soil, and pressing all firmly down. Established clumps are treated to a surface-dressing of guano. *R. D.*

TOMATOS AS A FARM CROP FOR SCOTLAND.—Hardly can this be possible or profitable until one of several things has happened. Our climate must be ameliorated, our Tomatos made hardier, the season between set and perfect maturity shortened, our farms sheltered in all directions with walls or boardings, covered with glass, and warmed more or less with artificial heat. With all our modern improvements in the colour, size, and flavour of Tomatos, their constitution, so far as it affects the measure of cold they can endure, remains exactly the same. This seems a fixed and stable quantity so far as it affects Tomatos, Potatos, Dahlias; neither will endure more or less cold than on the morrow after their introduction. Neither have we made much or any progress in shortening the period of production between the start and the finish of crops of Tomatos. Through the modern process of growing Potato sets as seed, we have shortened the period of production of this vitally important crop by a month or six weeks; or, which is very much the same thing, and even more convenient, we force them to do a spell of a month or more's work out of the ground. Something may be done also to curtail the work of Tomatos in the open air. But that can only be through the aid of artificial heat, additional shelter, &c.; selection of early varieties, the use of raised and dry borders, careful feeding, loosening the roots, &c., as suggested by your correspondent Mr. Brotherston. But over the greater part of Scotland there is little hope of the Tomato paying as a farm crop, unless the produce is converted into pickles in a green or immature condition. In warm, sheltered gardens, genial climates, or on walls, Tomatos may be grown large enough to colour and finish for eating and sauce by being cut before the frost, and suspended in warm kitchens or dry vineries with ripe Grapes until they ripen, which may be a month or six weeks after their removal from the plant; or better still, the plants are suspended with the unripe Tomatos on them. *D. T. P.*

APHIS ON BEECH-TREES.—Your advice to your correspondent as to aphides on Beech is not very good; a bushel of foot and lime-water mixed, and a big whitewash-brush are more to the purpose. Even a large tree can pretty well be cleared of the insects if a man gets up a ladder and carefully whitewashes the branches. The stem of the tree must be well washed down to the top of the roots, as the aphides goes under the soil, and hibernates on the top of the roots. I have tried this, and I know it succeeds. *J. S. Levett.*

—I notice one of your correspondents is enquiring about this; perhaps the following particulars will be useful to him. A very fine Beech-tree was attacked with this insect while I was at Ketton, and in the course of two or three seasons the main stem was thickly covered with the downy insects; the leaves got very sickly in appearance, and grew worse year by year, and I was sure that the tree would die if the insects were not killed. A workman was provided with a mixture of 6 oz. soft soap, and 1 oz. common brown carbolic acid in one gallon of water, and with this solution the bark was scrubbed. The time taken to scrub the tree was from two to three days, but it saved the tree, which was alive a few weeks since. This insect never leaves a Beech-tree when once it settles on the bark, and unless effective measures are taken against it, the tree is sure to die. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

EUCALYPTUS GLOBULUS IN CORNWALL.—I do not think this Eucalyptus is as rare, or as difficult to grow in England, as the paragraph (p. 322) would seem to suggest. In the extreme west of Wales I have seen several, all apparently doing well. One may be seen at Goodwick (Fishguard Bay) in Pembroke-shire, growing in a rather elevated and exposed position, though partly sheltered by a house on one side. Another one may be seen at Treffgarne. *T. H. D.*

TAPEINANTHUS HUMILIS.—I observe mention is made on p. 333, of *Tapeinanthus humilis* (Herbert), syn. *Carregnoa dubia* (Boissier), as a variety almost unknown in cultivation. I may remark that the difficulty of supplying its requirements in English gardens is the chief cause of its rarity, and Professor M. Foster, at Shelford, commands a combination of skill and favourable conditions rarely met with. The bulb is abundant near Gibraltar, I believe, on the same low ground which is frequented by *Narcissus vividiflorus*. A few years ago, one of my sons, when quartered at Gibraltar, sent me more than once an abundant supply of both these bulbs, which I distributed amongst those whom I thought most

likely to succeed in their cultivation, but I am afraid very few succeeded. I have tried every resource I know of, but in a year or two both these species seem to lose all distinction of season, and die out; but *N. bulbocodium* var. *monophyllum* I can do very well in a greenhouse, renewing it frequently from home-saved seed. *C. Wolley Dod, Edge Hall, Malpas.*

YOUNG GARDENERS AND THE R.H.S. EXAMINATIONS.—At the close of a recent lecture given to the members of the Mutual Improvement Society at Chiswick, members, and especially the younger ones, were strongly urged to prepare for and enter next examination, which takes place in April, 1899. It was specially urged that Chiswick, the gardens of the Society, should, of all places, furnish a good contingent of candidates. A young gardener, in the course of the discussion which ensued, and he with some others who spoke showed that they possessed intelligence and good theoretical knowledge, said one great reason why young gardeners did not enter as candidates was that they were to some extent, under the existing arrangements, placed in competition with students from colleges and laboratories who enjoyed ample training in the more highly regarded accomplishments of note-taking, and literary style in composition—accomplishments in which the average young gardener had no instruction or training. Hence, when they sat down for an examination, the college or laboratory-trained candidate, though, perhaps, less grounded in practical knowledge, obtained the highest number of marks because of his greater literary accomplishments. Thus, said he, in such an examination, young men who really have superior gardening knowledge, have to occupy a lower position in the lists than have those trained at institutions. There is no doubt but that this objection is a sound one, and can only be met by placing professionally-trained candidates into a diverse class and examination than ordinary gardeners are. *A. D.* [In such a case as this, examiners would attach relatively little importance to literary composition. *Ed.*]

AMARYLLIS BELLADONNA VAR. KEWENSIS.—

Referring to Mr. Thomson's query in your last issue:—The bulb of my example of this variety is more than twice as large as that of the type. There is also a difference in the tunic, that of the variety being smooth, brittle, shining, comparatively unbroken, and much less woolly than that of *A. Belladonna*. There is no difference in the shape of the respective bulbs. *G. B. M.*

WIRED AND CUPPED BLOOMS.—I should like once again to enter a protest against the presentation of flowers for awards or certificates, except in such a condition that their true form may be judged. In a very large number of cases Chrysanthemum blossoms are exhibited for the purpose of obtaining Awards of Merit, or other recognition, with their blossoms so firmly fixed into wire rings or tin cups that they cannot be withdrawn, and in such a fashion that the whole of the under-petals are forced upwards, so as to alter materially the outline of the flower, and render it impossible for the judges to determine whether it is loosely made or compact. A flower with drooping, loose petals, and one with normally stiff ones, giving it a flat character, are, when so treated, quite undistinguishable, and as such features are very material matters of taste, my contention is, that no support whatever should be permitted, that the presence of anything of the sort should, *per se*, disqualify the flower, which should be presented before the judges entirely on its individual merits of form, as well as tint, and general make. I am perfectly aware that for exhibition purposes, stands and other apparatus may be absolutely requisite—these lie outside my argument; nor have I anything to say against the dressing or careful arrangement of petal, since the disturbing factors of travel and packing may necessitate them; but what I do contend for is an unsophisticated flower as regards props and wires when it is brought to the judges' table. *Chas. T. Druery, F.L.S., V.M.H.*

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

In the cathedral at Reims, in one of the many pieces of tapestry there displayed, is a representation of a white Lily, with a rhizome beset with branching spines. The flower is correctly represented. The legend contains the words, "u't spras." Can any reader throw light on this spiny Lily?

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

November 8, 9, and 10.

CHRYSANTHEMUM ADMIRERS have during the past week had extraordinary opportunities to see collections of cut blooms and of plants in numerous centres in the South, West, East, and Midland Counties. The greatest interest, however, has naturally been associated with the exhibition of the National Chrysanthemum Society at the Royal Aquarium, Westminster. The show was a large one, without being of a "record" character. It was better in all sections than many had expected. The Japanese varieties again claimed most attention, and were shown in a greater degree of perfection than the incurveds. F. A. BEVAN, Esq., won the 1st prize in the Holmes Memorial Cup class for Japanese blooms, and would, no doubt, have done so in the class for incurveds also, but for an oversight. The more important classes for cut blooms were again arranged in the galleries, and most of the non-competitive exhibits were on the floor.

The principal classes for cut blooms, the competitive groups of Chrysanthemum plants, and much of the fruit, were arranged in the galleries. On the ground-floor were stands from most of the Chrysanthemum nurseries, also cut bloom classes, all of the florists' classes, and part of the fruit exhibits. The authorities of the Royal Aquarium on this occasion prevented public access to the galleries until the judges there had completed their duties. This concession was of great convenience to the judges and to the representatives of the Press. The specimen plants were staged in the St. Stephen's Hall, and the vegetables were there also. Specimen plants were not exhibited largely, and we sadly missed the exhibits that have usually come from the veteran Mr. D. Donald. So far as the arrangements of a flower-show can be made convenient in a structure of the type of the Royal Aquarium, the Secretary, Mr. R. Dean, is entitled to commendation for having done his best. From the report below it will be seen that Mr. MEASE, the champion of several seasons, has not been quite so successful on this occasion. The single flowered, Pompon, reflexed, and Anemone varieties were represented, but there was very little competition in these classes, although some of the exhibits were very good.

THE BATTLE OF SOCIETIES.

There were four societies represented in the class for affiliated societies' exhibits. Each society has to stage forty-eight blooms—an equal number of Japanese and incurved flowers. The 1st prize, consisting of £10 and the Challenge Trophy, was won by the PORTSMOUTH AND DISTRICT HORTICULTURAL SOCIETY with an exhibit that represented much the same quality in either section. The blooms generally were of good quality, and commendable. The whole of the blooms were contributed by Mr. J. AGATE, nurseryman, of Havant. The 2nd prize was awarded to the BROMLEY AND DISTRICT CHRYSANTHEMUM SOCIETY, there being blooms in the stand contributed by nine of its members. The BARNET AND DISTRICT CHRYSANTHEMUM SOCIETY was 3rd, with blooms from five of its members; and there was a further exhibit from the ISLE OF THANET CHRYSANTHEMUM SOCIETY.

OPEN CLASSES.

CUT BLOOMS.—JAPANESE.

Forty-eight blooms, *distinct*.—The Holmes Memorial Challenge Cup and £10 was won by Mr. W. H. LEES, gr. to F. A. BEVAN, Esq., Trent Park, Barnet, with a collection of capital blooms. The varieties were—*Back Row*: Surpasse Amiral, Australie, Lady Ridgway, Madame Carnot (good), Vivand Morel (good in colour and size), Louise, Oceana, Mrs. W. H. LEES, Mrs. C. H. PAYNE, Elsie Teichmann, Phœbus, Madame M. Ricoud, Mons. Hoste (grand), Reine d'Angleterre, and Mrs. H. WEEKS (capital). *Second Row*: Ella Curtis, magnificent in colour; Madame R. Rivoire, Ed. Molyneux, Mrs. LEWIS (good), Madame Rosseau, C. B. Haywood, Chas. Shrimpton, Mutual Friend, Pride of Madford, N.C.S. Jubilee, Simplicity, Souvenir de Mme. E. Roette, Mrs. Palmer, J. Bidecote, Souvenir d'une Petite Amie; and M. Chenon de l'éché (the best-coloured bloom we have seen). *Front Row*: Nellie Pockett, Robt. Powell, Edith Tabor, Mrs. F. A. BEVAN, Madeline Davis, Miss D. Shea, Lady Byron, Col. Chase, Mrs. MEASE, Chas. Davis, Joseph Chamberlain, President Nonin, Chatsworth, Col. W. D. Smith, Madame G. Bruant, and a promising red and yellow seedling. 2nd in this class was Mr. FREDERICK VALLIS, Bromham Fruit Co., Ltd., Chippenham. There was a beautiful bloom of the primrose sport of Madame Carnot (Mrs. Mease) in this stand, and it was sufficient to recommend the variety to everyone who saw it; Phœbus, Swanley Giant, and Yellow Madame Carnot were represented in this collection in the best possible condition. Altogether, it was well worthy of the 2nd prize. Mr. W. MEASE, gr. to A. TATE, Esq., Downside, Leatherhead, was 3rd; and Mr. J. W. McHATTIE, gr. to the Duke of WELLINGTON, Strathfieldsaye, Hants, 4th. There were seven exhibits.

Twenty-four Blooms, *distinct*.—This class is always a popular one, but on this occasion there were as many as sixteen exhibits. The quality of the 1st prize exhibit may be imagined, therefore, as being next to perfect.

Mr. R. Kenyon, gr. to A. F. HILLS, Esq., Monkham, Woodford Green, Essex, had the honour of winning the 1st prize. He had magnificent blooms of Madame G. Bruant, Phœbus, Edith Tabor, Madame G. Henry, John Neville, Madame Desblanc, Mrs. J. W. Barks (the sport from Edith Tabor), Charles Davis, Mons. Hoste, Master H. Tucker, Mrs. W. Mease, Mrs. Weeks, Soleil d'Octobre, Mrs. T. Carrington, the rest being of quality but little inferior to these. The 2nd prize was obtained by Mr. W. MEASE. He had grand blooms of Mrs. J. Lewis, Surpasse Amiral, Mrs. W. Mease, Ed. Molyneux, and others. Mr. H. Perkins, gr. to the Hon. W. F. D. SMITH, M.P., Greenlands, Henley-on-Thames, was 3rd; and the 4th prize was won by Mr. Jas. Brookes, gr. to W. J. NEWMAN, Esq., Totteridge Park, Herts, there being twelve unsuccessful exhibitors in this class.

Twelve blooms, *distinct*.—There was a large number of exhibits in this class, and the 1st prize was won by Mr. W. Meredith, gr. to D. P. SELLAR, Esq., Dudbrook, Brentwood. The best blooms in this stand were M. Chenon de Leché, Mons. Hoste, Mons. Pankoucke, Louise, C. B. Haywood, and Chas. Davis; Mr. F. King, gr. to A. F. PERKINS, Esq., Oak Dene, Holmwood, Surrey, was 2nd; Mr. R. Kenyon, gr. to A. F. HILLS, Esq., Woodford Green, Essex, 3rd; and Mr. H. SHOESMITH, Claremont Nursery, Woking, 4th, there being twelve exhibitors.

The best white Japanese variety shown in collections of six blooms was Madame Carnot, from Mr. NORMAN DAVIS, who, like last year, had six mammoth blooms of good quality; the same variety won 2nd and 3rd prizes, from Mr. G. Foster, gr. to H. HAMMOND-SPENCER, Esq., Glendaragh, Teignmouth; and Mr. Geo. Elder, gr. to J. W. BENSON, Esq., The Oaks, Walton-on-Hill. There were seven exhibitors.

The best yellow Japanese was Phœbus, Mr. H. SHOESMITH, of Claremont Nursery, Woking, having six capital blooms of this variety; the variety named Mrs. MEASE was awarded 2nd prize, but this is a very faint "yellow" indeed; Phœbus was again placed 3rd; Edith Tabor, well shown by Mr. W. McHATTIE, was 4th.

The best Japanese variety of any other colour than white or yellow, was Australie, from Mr. J. W. McHATTIE; next came Lady Hanham, in its best form, from Mr. W. Slogrove, gr. to Mrs. CRAWFORD, Gatton Park, Reigate; the 3rd prize was given to indifferent blooms of Vivand Morel.

The best six Japanese blooms, incurved, were from Mr. H. PERKINS; he had the new Australian incurved Japanese, John Pockett, also Australie, and President Bevan; these were his best blooms. Mr. JNO. JUSTICE, who was 2nd, had a very fine bloom of Australie, and another of Lady Byron.

Hairy Varieties.—The best collection of hairy-petalled varieties was from Mr. HENRY LOVE, High Street, Sandown, I.W.; Hairy Wonder was very good in this stand, and with Abbé Pievrie, Arthur, pure white, was the best. The 2nd and 3rd prize exhibits were not remarkable, except that in the 2nd prize exhibit were two good blooms of the new Leocade Gentils, a pale yellow hairy one, of much merit.

INCURVED BLOOMS.

Thirty-six blooms, *distinct*.—There were six collections in this rather exacting class, but the 1st prize of £10, and the Holmes Memorial Challenge Cup, was won by Mr. W. HIGGS, gr. to J. B. HANKEY, Esq., Fetcham Park, Fetcham. His varieties were—*Back Row*: Duchess of Fife, Mons. de Blanc (poor), Golden Empress (poor), Dorothy Foster, Globe d'Or, Madame Ferlat, John Lambert, Mrs. R. C. Kingston, Major Bonaffon, Robert Petfield, and Lady Isabel. *Second Row*: Empress of India, Ernest Cannell, Geo. Haig, J. Agate, Mrs. J. Eadie, Lord Alcester, Baron Hirsch, Queen of England, Mrs. R. King, C. B. Whitnall, F. W. Wilkinson, Alf. Salter. *Front Row*: D. B. Crane, Austen Cannell, Mrs. Coleman, Sir T. Lawrence, Bonnie Dundee, Miss M. A. Haggas, Violet Foster, Jeanne d'Arc, Violet Tomlin, M. P. Martignat, Madame Darier, and Princess of Wales. Generally, the blooms in the above collection were a little below average N. C. S. quality. The 2nd prize was awarded to Mr. J. H. Goodacre, gr. to the Earl of HARRINGTON, Elvaston, Derby, and Mr. W. Mease, gr. to A. TATE, Esq., Downside, Leatherhead, was 3rd.

Unfortunately, the collection of incurveds shown in the above class by Mr. LEES was disqualified owing to the varieties Mrs. Heal and Princess of Wales being shown. The fact that these two varieties have been declared by the Society to be too much alike to be included in the same stand had been overlooked. It was a pity, as Mr. LEES' blooms were decidedly the best exhibited.

Twenty-four Incurved, *distinct*.—There were fine collections in this class, and the 1st prize was won by Mr. W. HIGGS. The varieties that figured best here were Ma Perfection, Princess of Wales, Duchess of Fife, Mme. Ferlat, Jeanne d'Arc, Queen of England, and Major Bonaffon. Mr. W. Wilson, gr. to R. C. CHRISTIE, Esq., Ribsdon, Updown Hill, Bagshot, was 2nd; and Mr. T. Robinson, gr. to W. LAWRENCE, Esq., J.P., Elsfeld House, Ho llingbourne, Kent, 3rd. There were six exhibitors.

Twelve Incurved blooms.—There were eight collections shown in this class, and the 1st prize collection exhibited very commendable quality. It was shown by Mr. G. J. Hunt, gr. to PANTIA RALLI, Esq., A shstead Park, Epsom, and included the varieties Duchess of Fife, Mons. Desblanc, Ma Perfection, Globe d'Or, Golden Empress, Mrs. Dorothy Forster, Empress of India, Charles H. Curtis, John Lambert, Mr. S. Coleman, Miss M. A. Haggas, and Lord Alcester.

Mr. W. ROBINSON, Mr. J. W. McHATTIE, and Mr. W. G. ADAMS, florist, 89, Clarendon Road, Southsea, won prizes in this class in the order mentioned.

The best six incurved of one variety represented the variety Duchess of Fife in its best condition. The blooms were from Mr. G. J. HUNT. The variety C. H. Curtis from Mr. W. L. Farmer, gr. to H. P. LESCHALLAS, Esq., Higham, Windlesham, Surrey, and Miss Violet Foster, from Mr. T. ROBINSON, won 2nd and 3rd prizes respectively.

REFLEXED BLOOMS.

The best collection of twelve large-flowered reflexed blooms, not fewer than nine varieties, was shown by Mr. T. CARYER, gr. to A. G. MEISSNER, Esq., Aldenholme, Weybridge. There were no novelties in this class, but such familiar names as the various coloured Christines, Dr. Sharp, Cullenfordi, and others. 2nd, Mr. W. Robinson, gr. to the Rt. Hon. Lord LUDLOW, Heywood, Westbury.

ANEMONE LIKE BLOOMS.

The best collection of twelve blooms, distinctly large-flowered Anemones, was shown by Mr. J. JUSTICE, gr. to Right Hon. Sir R. TEMPLE, Bart., The Nash, Kempsey, Worcester. The varieties were Junon, pale lilac; Descartes, crimson (magnificent); Delaware, white with primrose cushion; Gladys Spaulding, yellow; Ernest Cannell, pink with yellow cushion; Cincinnati, pale pink, with darker cushion; Lady Temple, a red sport from Lumière d'Argent; Mrs. J. Benedict, white with lemon-coloured cushion; Lady Margaret, pure white; Mons. C. Lebosqz, buff, with orange-coloured cushion; Fleur de Marie, the old pure white variety; and E. C. Jukes, pale purple, with buff-coloured cushion. 2nd, Mr. W. Ring, gr. to JAS. WARREN, Esq., Capel House, Waltham Cross; and 3rd, Mr. Ives, gr. to E. C. JUKES, Esq., Hadley Lodge, Barnet.

The only collection of Anemone Pompons apparently was one from Mr. JNO. JUSTICE, and many of the varieties having much reflexed ray florets, they do not make much display.

There were fine collections of 24 large-flowered Anemone blooms, and Mr. W. RING, gr. to JAS. WARREN, Esq., Capel House, Waltham Cross, who was 1st, had a very pretty and commendable collection. The following varieties were conspicuous in the exhibit:—Mrs. P. R. Dunn, white; Nelson, purple; John Bunyan, yellow; Delaware, white; M. C. Lebosqz, orange buff; Lady Margaret, white; Mme. Robert Owen, white; Queen Elizabeth, white; and M. Dupanloup, purple. The blooms in the collection from Mr. W. Skeggs, gr. to A. MOSELY, Esq., West Lodge, Hadley, Barnet, who who was second, were a little smaller, but also somewhat neater: Descartes, Sir W. Raleigh, Junon, Mdle. Lawson, and Queen Elizabeth were magnificent. Mr. JNO. JUSTICE beat the others for 3rd place.

Of Japanese Anemone blooms, the best collection of twelve distinct varieties was from Mr. W. ROBINSON. The varieties W. W. Astor, white, and Seur Dorothy Souillere were very nice in this collection. The 2nd prize was won by Mr. W. SKIGGS, and the 3rd by Mr. JOHN JUSTICE.

POMPONS.

These were generally good, and the method of exhibiting them, which displays the foliage as well as the blooms, render the classes a pretty change from the show varieties. The best dozen sprays distinct, three blooms in a spray, was from Mr. T. CARYER. The following varieties were conspicuous in the stand—W. Westlake, yellow; Mdle. Elise Dordan (still the prettiest of Pompons), Black Douglas, crimson; Mdle. Martha, white; Perle des Beautés, crimson, with silver reverse; Toussaint Marzot, pale purple; Mr. Holmes, orange-red; and Pygmalion. 2nd, Mr. W. Aldridge, gr. to G. LACEY, Esq., Springfield House, Palmer's Green; and 3rd, Miss R. DEBENHAM, St. Peters, St. Albans.

SINGLE-FLOWERED VARIETIES.

As usual, the exhibits in this section illustrated the exquisite beauty of the single-flowered Chrysanthemums, and also the diversity and variety that the Chrysanthemum offers. The best collection of twelve varieties in sprays of three blooms each, was shown by Mr. W. ALDRIDGE, and a beautiful exhibit it was. The varieties were every one of them worth cultivating. They were Lady Churchill, red; Alphonse, white or pale pink; Springfield Beauty, Admiral Sir T. Symonds, yellow; Purity, white; Miss A. Mumford, yellow; the florets having red margins; Miss Brown, lilac with white centre; Ewan Cameron, white; Framfield Beauty, a real beautiful crimson rose-pink; and Oceana, white. The 2nd prize collection came from Mr. G. W. FORBES, gr. to Mme. NICOL, Regent House, Surbiton.

SPECIAL PRIZES.

The Turner Memorial Challenge Cup having been again awarded to Mr. DAVIS, Framfield, Sussex, it has now become his property. It was offered for thirty-six blooms of white, yellow and crimson Japanese Chrysanthemums, in twelve varieties, three blooms of each, to be shown on ordinary boards, with six inches of clear stem above the boards.

Mr. NORMAN DAVIS, of the Framfield Nurseries, Sussex, was 1st, staging Madame Carnot, Joseph Chamberlain, President Nonin, Mutual Friend, Phœbus, E. Molyneux, S. C. Probyn, Oceana, Dorothy Seward, Madame Gustave Henry, General Roberts, and G. J. Warren. These blooms were of the greatest merit, and not less remarkable than the blooms was the extraordinary foliage shown. Mr. W. J. GODFREY, Exmouth Nurseries, was 2nd. Mrs. Mease, G. J. Warren, and Joseph Brooks were the best represented varieties in this stand.

The 1st prize in Mr. H. J. Jones' special class for an exhibit of two blooms each of Mrs. Wm. Mease, G. J. Warren, and Mme. Carnot was won by Mr. W. MEASE, the 2nd by Mr. W. HIGGS, and the 3rd by Mr. G. FOSTER.

PLANTS.

The best collection of four standard-trained specimens (any varieties) was from Mr. W. Davey, gr. to C. C. PAINE, Esq., Hillfield, Haverstock Hill, N.W. His varieties were W. Tricker, Cleopatra, Stanstead Surprise, and Eva Knowles. These were much better-grown plants than the 2nd prize collection from Mr. F. E. WRIGHT, gr. to J. TROUP, Esq., Essex Lodge, Upper Clapton.

Six trained specimens Pompons were best from Mr. F. Gilkes, gr. to A. MORRIS, Esq., Court Green, Leigham Court Road, Streatham, showing the varieties: W. Kennedy, crimson; W. Westlake, yellow; Frenzy, bronze; and St. Michael, yellow.

Mr. F. E. WRIGHT, gr. to J. TROUP, Esq., Essex Lodge, Upper Clapton, had very excellent plants in the class for four trained specimens, any variety, showing Charles Davis, Jno. Shrimpton, W. Tricker, and Col. W. B. Smith. Chas. Davis and Jno. Shrimpton were the best plants. 2nd, Mr. F. Gilkes, who had also good plants, particularly of the varieties, Jno. Shrimpton and Col. Smith.

Groups.—The groups of Chrysanthemums in pots, with foliage plants, arranged on a circle of 12 feet in diameter, were this year in the usual spot in the side gallery. The space being so limited, and always circular in shape, it would be unfair to criticise the exhibits from the standpoint that they offer no departure from the previous cone-like method of arrangement. That scarcely any other disposition of the plants would be possible, must be granted, and this allowed for, the highest praise is deserved by the exhibitors. The winner of the 1st prize was Mr. J. SPINK, Summer Road Nurseries, Walthamstow; his Chrysanthemums were very well cultivated, and a few of the novelties, such as Mrs. White Popham, Mrs. T. Carrington, &c., could be noticed amongst them; a few plants of Cocos Weddelliana amongst the plants, with one for a crown, and a few Codiaums around the group, constituted the ornamental foliage feature. Mr. W. Howe, gr. to Sir H. Tate, Bart., Park Hill, Streatham Common, who has won many 1st prizes for such exhibits previously, was a good 2nd; and Mr. E. Dow, gr. to W. E. FAY, Esq., Bickley Hall, Bickley, was 3rd.

AMATEURS' CLASSES—DIVISION A.
CUT BLOOMS.

Japanese blooms.—The winner of the class for eighteen Japanese blooms distinct, was Mr. L. GOOCH, gr. to T. WICKHAM JONES, Esq., Tower Lodge, South Norwood, there being two other exhibits in the class. There were fine blooms of Mutual Friend, Madame Carnot, Simplicity, Mrs. H. Weeks, International, Edith Tabor, Charles Davis, and Vivand Morel. 2nd, Mr. A. HOONEY, gr. to G. H. COX, Esq., The Grange, East Barnet; and 3rd, Mr. A. N. SEABROOK, gr. to W. WILLIS, Esq., Ellerslie, Buckhurst Hill, Essex, both of the collections being commendable.

There was much competition in the class for twelve blooms, and the 1st prize was won by Mr. W. A. BROWN, gr. to H. W. SILLEM, Esq., The Pines, Hersell, Woking, with a collection of blooms of first class quality, and including several of last season's novelties. Of the eleven other competitors, Mr. R. Gladwell, gr. to SYDNEY SMITH, Esq., Werndee Hall, South Norwood, was 2nd; and Mr. J. Acock, gr. to Mrs. BACON, Stoneleigh, Worcester Road, Sutton, Surrey, 3rd.

There were twelve exhibits of six blooms distinct, and the 1st prize was won by Mr. R. GLADWELL. He had a first-class bloom of G. J. Warren, and his other blooms, Mdle. Marie Horté, Phœbus, Madame Carnot, M. Chenon de Leché, and Reine d'Angleterre, were all good. 2nd, Mr. W. PERRIN, gr. to C. W. RICHARDSON, Esq., Sawbridgeworth.

The best blooms of any variety were of Phœbus, from Mr. Jno. Denyer, gr. to Ed. SMITH, Esq., Ingleside, Chatham.

Incurveds were not very good, being too flat. The best collection of twelve blooms was shown by C. E. WILKINS, Esq., Wellington, Swanley Junction, and the same exhibitor was the winner of the class for six varieties.

The best blooms of any one variety were of C. H. Curtis from Mr. A. HOONEY.

DIVISION B.

The winner of the class for eighteen Japanese blooms distinct, was A. R. KNIGHT, Esq., Ashford, Kent. The blooms were of good size, but there was a great lack of variety, yellow and bronze coloured flowers being too common. There were five collections.

A. H. NEEDS, Esq., won the class for twelve blooms with an exhibit of very fine flowers, and a pretty collection, and this exhibitor was 1st also for six blooms. The best blooms of one variety were of Phœnix from NORMAN WRIGHTSON, Esq., 55, Elgin Road, Addiscombe, Surrey, who showed the variety in grand condition.

A. R. KNIGHT, Esq., won for twelve incurved, having well-built blooms of moderate size. The best collection of six blooms were from Mr. W. G. P. CLARK, York Road, Hitchin.

Six sprays of Pompons not disbudded were best from Mr. A. TAYLOR, East Finchley, N.

MAIDEN GROWERS.

The four classes reserved to exhibitors who have never previously showed at the N. C. S. exhibitions were exceedingly well competed, and the sign is a very encouraging one. Mr. H. FOLKES, gr. to E. C. STRACHAN, Esq., Gaddesden Place, Hemel Hempstead, had the best six Japanese, there being sixteen exhibitors in the class. Fifteen again staged collections of three blooms, and the winner proved to be the same as in the class for six blooms.

Mr. Jas. COOMBER, gr. to Mrs. SAUNDERS, Warren Lodge,

Kingston Hill, had the best collection of six incurveds; and Mr. R. POOL, gr. to J. B. PURCHASE, Esq., Blackstones, Redhill, won the 1st prize for three blooms.

TABLE DECORATIONS, BOUQUETS, &c.

These, as usual, were of much merit, and altogether made a great display. The largest class in the section called for a table of bouquets, wreaths, sprays, buttonholes, &c., with a view to displaying the effectiveness of the Chrysanthemum. This class was in one of the galleries, and an exhibit from Messrs. PERKINS & SONS, Coventry, won the 1st prize. One of the features upon the table was a very fine cross of White Chrysanthemum blooms, over which were thrown a few slender sprays of bright red-coloured Ampelopsis Veitchii. Then there were shower bouquets, a floral harp, cushions of flowers, &c. The table was covered with a green cloth, and a large mirror. 2nd, Miss N. ERLEBACH, florist, Stoke Newington, who had a rich exhibit which erred in being a little overdone. The best three epergnes were a trio from Mr. C. B. COLE, The Vineyard, Feltham; and Mr. F. W. SEALE, Vine Nurseries, Sevenoaks, was 2nd. There were many exhibits, and for the epergnes, a few small decorative blooms are the most suitable, these being relieved with pretty Codiaum leaves, and slender greenery.

Mr. Mark WEBSTER, gr. to E. J. PRE-TON, Esq., Kelsey Park, Beckenham, had the best exhibit of two vases of Pompon or Anemone Chrysanthemums, and there were very many other exhibits. 2nd, Mr. W. GREFF, Jr., Harold Wood, Essex. We did not see any Anemone-type flowers in either exhibit.

The best two hand-bouquets were shown by Mr. MARK WEBSTER, who had very pretty ones indeed. None but single-flowered varieties were utilised by this exhibitor, nor could any be more charming. There was a class for hand-baskets (Ladies), as suitable for placing upon a drawing-room table, and Miss EASTERBROOK, who took 1st prize, had a charming arrangement. The variety Edith Tabor and a white one, were those used. There were nearly a dozen exhibitors in the amateurs' class for one vase of six blooms of any Japanese Chrysanthemum, and Mr. THOS. PARKINE, gr. to F. W. F. WARD, Esq., 34, Bisham Gardens, Highgate, was the winner of 1st prize. The exhibits generally were most satisfactory.

Miss EASTERBROOK won 1st prize in the remaining class of this section. It called for a basket of natural autumn foliage and berries, and this exhibitor beautifully balanced the one against the other, obtaining a very admirable effect.

FRUIT AND VEGETABLES.

There were a few classes as usual for fruits and vegetables, and beyond these many special prizes were offered for vegetables by several firms.

The best three bunches of white Grapes were Muscats of Alexandria, from Mr. W. H. LEES, gr. to F. A. BEVAN, Esq., Trent Park, Barnet; and the best two of black Grapes were capital Black Alicantes, from Mr. W. HOWE.

Gros Colmar was best shown by Mr. W. TAYLOR, gr. to C. BAYR, Esq., Tewkesbury Lodge, Forest Hill, S.E.

For six dishes of dessert Apples, Mr. H. BERWICK, Sidmouth Nurseries, Devon, was 1st; and Mr. A. J. THOMAS, Bargins Hill, Rodmersham, Sittingbourne, 2nd. The specimens were very commendable.

Mr. W. STOWERS, gr. to G. H. DEAN, Esq., Sittingbourne, had the best kitchen Apples, in fourteen dishes; and Mr. A. J. THOMAS won for six dishes of dessert Pears, showing very nice ripe fruits of choice varieties.

Messrs. Sutton & Sons' special prizes for six dishes of Potatoes brought a great amount of competition. Mr. E. S. WILES, gr. to the Hon. IVELYN HUBBARD, M.P., The Rookeries, Down, Kent, won the 1st prize; and seven or eight other prizes were awarded in this class. The best two dishes of Potatoes were from Mr. Silas COLE, gr. to the Right Hon. Earl SPENCER, Althorp Park, Northampton.

Messrs. Webb & Sons, Wordsley, Stourbridge, offered special prizes for a collection of nine dishes of vegetables. Mr. E. BECKETT, gr. to Lord ALDENHAM, Aldenham House, Elstree, won 1st prize; and Mr. R. LYE, gr. to Mrs. KINGWELL, Sydenham Court, Newbury, 2nd prize, the collection in each case being very good.

Special prizes were also offered by Mr. R. SYDENHAM for various kinds of vegetables, and the principal prizes in these numerous classes were won by Mr. E. BECKETT, Mr. R. LYE, Mr. T. WILKINS, gr. to Lady THEODORA GUEST, Inwood House, Henstridge; Mr. READ, gr. to the Earl of CARNARVON, Bretby Park, Burton-on-Trent; Mr. H. FOULKES, gr. to C. E. STRACHAN, Esq.; and Mr. W. POPE, Highclere Gardens, Newbury.

EXHIBITS FROM THE TRADE.

Mr. H. J. JONES, Ryecroft Nursery, Ilith Green, Lewisham, made a magnificent display on the ground floor, under the large organ. There were two large groups of Chrysanthemum plants, and betwixt these was a table, where handsome vases containing handsomer blooms were displayed, covering altogether an area of 400 feet. The groups of Chrysanthemums were finer than usual of Codiaums and other decorative plants, these in the present instance being confined to the margin of the group. In addition to all this were many cut blooms of high-class novelties, and a few of the latest were well represented, as Mrs. H. J. Jones, a very large truly incurved flower, white, or tinted with palest lemon; R. Hooper Pearson, the deepest yellow Japanese yet raised, several plants being shown that demonstrated the grand habit of this fine variety; Lord Aldenham, a yellow sport from Ed. Molyneux; Mr. A. Barrott, a reddish and buff sport from Mrs. C. Harman-Payne, and many others. A Gold Medal was awarded this very large and meritorious exhibit.

Messrs. H. CANNELL & SONS, Swanley, filled a long table to overflowing with flowers and plants. There were six long rows of Chrysanthemum blooms, and many varieties, such as Swanley Giant, Mrs. W. Mease, N. C. S. Jubilee, Lady Hanham, Pride of Madford, Ella Curtis, &c., were represented capitally. But Mr. Cannell's Chrysanthemums are noticed more fully in another column. In addition to the Chrysanthemums, however, there was an extraordinarily fine display of sprays of winter-flowering zonal Pelargoniums; and at either end of the table were groups of Cannas, of magnificently bright colours. A Gold Medal was awarded to Messrs. Cannell.

Close to Mr. Cannell's exhibit was a fine group of Chrysanthemums in bloom, from Messrs. J. PEED & SONS, Roupell Park Nurseries, Norwood Road, London, S.W.

Messrs. W. RAY & Co., Mount Pleasant Nursery, Teynham, Kent, exhibited a dozen blooms of a pretty yellow sport from Mdle. M. A. de Galbert. The sport has been named Archie Ray.

Mr. J. AGATE, Chrysanthemum Nurseries, Havant, showed blooms of Jane Molyneux, a fine new white Japanese; John Miles, a new incurved; and Nellie S. Threlfall.

Messrs. W. CUTBUSH & SONS, Highgate Nurseries, London, N., had a large table in the gallery, which displayed groups of Chrysanthemum plants, of Begonia Gloire de Lorraine, Pernettyas, Cyclamens, Ericas, a few Carnations, Malmaison type and tree varieties; Lilies of the Valley, from retarded crowns; Roman Hyacinths, Richardia Elliotiana, Apples, &c.

Messrs. JNO. LAING & SONS, Forest Hill Nurseries, London, S.E., had a group of Conifers in pots, Pernettyas, variegated Hollies, &c. Also a standard-clipped Box-tree, representing a bird over the globular head of the tree.

From Mr. R. OWEN, Maidenhead, was shown a grand 1 ft of cut Chrysanthemums, and among these was noticed a novelty named Lord Cromer, a very bright crimson, Japanese, with light buff reverse. It is not very large, but a most attractive variety; Mrs. H. Weeks, and others were very fine in this stand.

Mr. W. J. GODFREY, Exmouth Nurseries, Devon, furnished one side of a long table with specimen blooms of newer Japanese and incurveds. We noticed Mary Molyneux, Le Grand Dragon, Marie Calvat, Lady Ridgway, G. J. Warren, Mrs. W. Mease, Prince Charles of Denmark, a capital yellow Japanese incurved; Duke of Wellington, and others.

Messrs. B. S. WILLIAMS & SON, Upper Holloway, London, N., had a large non-competitive exhibit, including a good number of hybrid Cypripediums, Dendrobiums, Lycas's Skinneri, Cattleya labiata, and rare batches of Ericas, Pernettyas, &c. A small Gold Medal was awarded this exhibit.

Mr. JNO. RUSSELL, Richmond Nurseries, Surrey, showed a collection of Ivies in pots, the group exhibiting very considerable variety, including several forms of Tree Ivy.

Mr. T. S. WARE, Ltd., Hale Farm Nurseries, Tottenham, had an exhibit of Chrysanthemum flowers.

Various stands from manure manufacturers and dealers, displayed the "One and All" manures, Ichthemio guano, City of Manchester Concentrated Manure, Law's Garden Manures, Dowell & Sons specialties, the Permanent Nitrate Committee's Nitrate of Soda, and Mr. J. George's specialties from Putney, including Thomson's Vine and Plant Manure.

ROYAL HORTICULTURAL.

NOVEMBER 8.—The meeting of the committee on this occasion resulted in a very fair display for the late period of the year, and of this Orchids formed no inconsiderable part. Amongst these last was a good show of Garden hybrids and crosses of hybrids from Messrs. J. VEITCH & SONS, and of varieties of Cattleya labiata from Mr. J. DOUGLAS. Mr. ELWES' brilliant show of Nerines attracted much attention. Naturally the Chrysanthemum and hardy fruit formed the backbone of the display.

Floral Committee.

Present: W. Marshall, Esq., in the Chair; and Messrs. H. B. MAY, J. H. FITT, G. STEVENS, J. JENNINGS, J. F. McLEOD, W. HOWE, C. E. PEARSON, J. D. PAWLE, H. J. BENNETT-POE, CHAS. SHEA, E. T. COOK, H. TURNER, C. T. DREURY, C. JEFFRIES, Ed. MAWLEY, and Geo. ENGLEHEART.

Messrs. J. VEITCH & SONS, Ltd., Royal Exotic Nursery, Chelsea, displayed several crosses between Begonia socotrana and tuberous varieties. Among the finer were B. Winter Perfection, a semi double as regards the male blooms, which latter preponderate. The male flowers measure 2½ inches across, and possess smaller overlapping petals ½ to ¾ inch in length. The colour is a deep rose-pink, foliage green, oval in general outline, and stems green; height, 1½ foot and over (Award of Merit). The same firm showed Begonia Mrs. Beal, previously certificated, and B. Myra, with male and female blooms of single shape and a bright pink tint—a variety from its pendulous habit, well adapted for planting in baskets. Other plants shown were Polypodium nigrescens, distinct; P. vulgare grandiceps, a variety with crumpled fronds, and a habit dwarf and compact; P. grandi-nigrescens, from P. grandiceps and P. nigrescens, a supposed hybrid with peculiar bunched tips or tasselling to the fronds (First-class Certificate); Dracana The Sirdar, a plant with broad recurving leaves of bronzy-green tint broadly margined with rose (Award of Merit); a large plant, 6 feet in diameter and 3½ feet high, of Aster Tradescanti, small white blossoms in extraordinary profusion; Aster grandiflorus, fine purple rays and yellowish disc; and A. Drummondii Sappho (Award of Merit).

H. J. ELWES, Esq., Colesbourne Park, Gloucestershire (gr., Mr. Lane), showed a number of *Nerines* in much variety of colour, and an Award of Merit was made to N. Mrs. Douglas, pink, having a bluish tinge, with fine flowered corymbs; N. Lady Clementine Mitford, pale pink, with a moderately long pedicel and tallish scape (Award of Merit); N. Miss Jekyll, a salmon-rose, very pretty, with long pedicels (Award of Merit). A Silver-gilt Banksian Medal was awarded for the group.

W. H. EVANS, Esq., Forde Abbey, Chard (gr., Mr. J. Crook), showed a boxful of fine double-flowered Violets, culled from plants growing in the open.

Messrs. BUNYARD & Co., Old Nurseries, Maidstone, showed a number of plants of the fine white-flowered *Pelargonium*, White Abbey, a semi-double flower of great substance and long endurance in all weathers. The plants were growing in pots, and had been specially treated for late flowering. It is the best white variety we know of for bedding or pot-culture, especially as a winter flowerer.

Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, exhibited a collection of *Polypodiums* in fifty species and varieties. We name a few of the more rare:—*P. Xiphias*, a frond of great breadth, forming almost a "bird's-nest" shape; *P. piloselloides*, a small, creeping species, with frondose rhizomes of dwarf, small growth; *P. aureolatum*, *P. crassifolium*, *P. decurrens*, a handsome, boldly-divided frond; *P. nigrescens*, *P. plumosum*, *P. terminale*, forming a confused mass of bright-green palmate fronds; *P. crenatum*, *P. trichodes cristata*, *P. Lenzanianum*, a handsome species of dwarf, spreading habit; and the climbing *P. venosum*. Mr. MAY also showed a number of plants of *Begonia Gloire d. Lorraine*, and a variety of the *Chrysanthemum Ivory* (Silver-gilt Flora Medal).

Messrs. SANDER & Co., The Nurseries, St. Albans, exhibited a few new specimens and varieties, including some well-cultivated specimens of *Acalypha Sanderiana*, with a multiplicity of its pendent floral tails; *A. Godseffiana* is inconspicuous as regards the flowers, but has prettily variegated foliage; *Dracana Sanderiana*, and two plants of *Kentia Kersteniana*, a striking looking Palm, with leaves widely pinnate, the wedge-shaped leaflets curiously erose, and of dark green tint.

Mr. W. WELLS, Earlswood Nurseries, Redhill, showed a rather extensive lot of *Chrysanthemum* blooms in variety, including some that had been cut from plants not disbudded; early-flowering Japanese of various sections, incurveds, and others. We remarked in the early-flowering varieties the green flowered *Madame E. Rogers*, a flat, slightly incurved flower; the showy *Crimson Pride*, *Mychett Beauty*, both yellow and white forms. Among Japanese there were nice examples of *Nellie Pockett* (Award of Merit), *President Nonin*, *Madame Phillip Rivoire*, *Mrs. White Popham*, *Mary Molyneux*, *John Pockett* (Award of Merit), *Leocadia Gentil*, a minutely-haired variety; *General Paquin*, a kind of sky-terrier-like flower of a reddish-orange in tint; *President Bevan* (Award of Merit), *Joseph Chamberlain*, a crimson-tipped bronze. A few incurved varieties were mixed in the stands with the Japanese, and some few of them were in fine form. The not disbudded flowers were rather unfairly handicapped by being placed beside the highly artificial Japanese and incurveds (Silver Flora Medal).

Mr. T. S. WARE, Hale Farm Nurseries, Tottenham, showed a quantity of *Cactus* and *Pompon Dahlias*, as well as a few single-flowered *Chrysanthemums*, chiefly white and pink varieties. The Dahlias were wonderfully fresh looking considering the time of year (A Silver Flora Medal).

Mr. W. J. GODFREY, The Nurseries, Exmouth, showed several blooms of *Chrysanthemum Dome d'Or*, a fine, orange-coloured incurved, the flowers being most nicely developed; of *King of the yellows*, *Coeleste Falconnet*, *Marie Calvat*, *Le Grand Dragon*, *Mr. T. Carrington*, *Mrs. J. G. Ganner*, a fine, yellow incurved Japanese; *Lord Boston*, and *President Bevan*, this last receiving an Award of Merit.

Mr. Molyneux, gr. to J. C. GARNIER, Esq., Rooksbury, Fareham, exhibited a pure white Japanese *Chrysanthemum* of striking aspect, *Jane Molyneux* (Award of Merit).

Mr. ROBT. OWEN, Castle Hill Nurseries, Maidenhead, showed the beautiful Japanese *Lord Cromer*, crimson, with a fawn-tinted reverse (Award of Merit).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. J. O'Brien (Hon. Sec.), De B. Crawshaw, J. Douglas, H. M. Pollett, H. Ballantine, H. Little, F. J. Thorne, W. H. Young, T. Statter, and H. J. Chapman.

A very bright and varied group was staged by Messrs. J. VERRA & Son, Royal Exotic Nursery, Chelsea, for which a Gold Medal was unanimously recommended.

The main feature of the group consisted of handsome hybrid Orchids which flower at this season, and which have been raised by them. The finest three of these had *Lælia Perrini* as the seed-bearing parent, of which were shown *L.-C. × Decia* (*L. Perrini* × *C. Dowiana*), *L.-C. × Statteriana* (*L. Perrini* × *C. labiata*), *L.-C. × Lady Rothschild* (*L. Perrini* × *C. Warscewiczii*); a fourth, *L.-C. × Semiramis* (*L. Perrini* × *C. Gaskelliana*), was also shown. All possessed very charming flowers, exhibiting the brightness and peculiar characteristic of the lip of *L. Perrini*, but with all the parts much larger than in that species. Another fine set of hybrids which may be mentioned in the same terms, viz., hybrids of *Cattleya Bowringiana*, were shown—*C. × Portia* (*Bowringiana* × *labiata*); *C. × Wendlandi* (*Bowringiana* × *Warscewiczii*); varieties of *C. × Mantini*, of the Veitch strain (*Bowringiana* × *Dowiana*), and *C. × Chloris* (*Bowringiana* × *Maxima*).

Others remarkable for beauty were hybrids of *Lælia-Cattleya* × *Nysa*, which seem an improvement on *L.-C. × exoniensis*; the pretty *L.-C. × Ascatia* (*C. Trianae* × *L. xanthina*); *L.-C. × callistoglossa ignescens*; *Lælia* × *splendens*, *Cypripedium* × *Euryades*, *C. × Milo*, *C. × Niobe*, *C. × microchilum*, varieties of *C. × Arthurianum*, *C. × T. B. Haywood*, *C. × enanthum superbum*, *C. × Harrisianum superbum*, *C. × Prospero*, and *C. × Actæus*, both hybrids of *C. insignis Sanderæ*, but not differing much from pale *C. × Leeanum*; *Masdevallia* × *Ajax*, *M. × Imogen*, *M. × Parlatoresana*, *Miltonia* × *Bleuana*, &c.

Of the species and varieties which attracted much attention were two fine examples of the true *Cypripedium insignis Sanderæ*; a good specimen of *C. Lawrenceanum* *Hycanum*, *Cattleya aurea*, varieties of *C. labiata*, fine spikes of *Oncidium varicosum*, *O. Forbesii*, *O. dactyle*, *O. prætectum*, and *O. spillopterum*; plants of the elegant *Ionopsis paniculata*, *Dendrobium atroviolaceum*, *D. bracteatum*, and a pretty tuft of the singular-looking *Pleurothallis lateritia*, with its slender sprays of brick-red flowers.

The Right Hon. JOSEPH CHAMBERLAIN, Highbury, Birmingham (gr., Mr. Smith), was awarded a Silver Banksian Medal for a group made up of the pretty *Cattleya Mrs. Edicott* (*maxima* × *Lodigesii*), a neat light rose-coloured flower, with delicate purple veining on the lip; *L.-C. × Fausta delicata* (*C. Lodigesii* × *L.-C. × exoniensis*), *L.-C. × Semiramis* (*L. Perrini* × *C. Gaskelliana*), *L.-C. × Sallieri magnificum* (*L. purpurata* var. × *C. Lodigesii*), a showy hybrid, with pale-rose flowers, and dark purplish-crimson front to the lip; and a very fine form of *Dendrobium Phalanopsis Schroderianum* with white flowers, having the outer halves of the petals bright-rose, and the blade of the lip purple.

J. BRADSHAW, Esq., The Grange, Southgate (gr., Mr. Whiffen), staged a pretty group of varieties of *Cattleya labiata*, of which the most remarkable were *C. l. Etona*, with white sepals and petals, and purple marking on the lip; and *C. l. Bradshaw's* var., an equally charming bluish-white form, with pale-rose front to the lip. Also in the group were *Cattleya* × *Mantini nobilior*, *L.-C. × Decia* and *L.-C. × Statteriana* (Silver Banksian Medal).

Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), showed *Cattleya Bowringiana* "Lady Wigan," a fine flower, exhibiting remarkable colour variation. The sepals and petals were white slightly tinged with lilac; the lip white at the base, having the medium zone of a claret-purple, and the apical portion rose colour (Award of Merit).

R. I. MEASURES, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), showed the fine *Cypripedium* × *Wottoni* (*bellatulum* × *callosum*). The large bold flower had the upper sepal feathered with rosy-purple, the petals white, tinged with dark rose, and a still darker reddish-rose labellum (Award of Merit).

Sir WM. MARRIOTT, Bart., Down House, Blandford (gr., Mr. Denny), showed *Sopho-Lælia* × *Marriotti* (*S. grandiflora* ♀, *Lælia flava* ♂) with a two-flowered inflorescence of bright yellow flowers, with reddish markings on the lip.

A Silver Banksian Medal was awarded to H. F. SIMONDS, Esq., Woodthorpe, Beckenham (gr., Mr. G. E. Day), for a group in which were varieties of *Cattleya labiata*, *Lycaste Skinneri alba*, *Masdevallia tovarensis*, *Oncidium Forbesii*, *O. varicosum*, *Odontoglossum grande*, *Acampe papillosa*, &c.

Messrs. F. SANDER & Co., St. Albans, showed for the first time the singular *Dendrobium chloropterum*, a very curious species, with the habit of *D. atroviolaceum*, having emerald-green flowers, the labellums veined with dark purple (Botanical Certificate). Messrs. Sander also showed *Cymbidium Tracyanum*, and *Cypripedium* × *Jensenianum* (*hirsutissimum* × *vexillarium*).

Lord LISBURN, Crosswood Park, Aberysthwith (gr., Mr. Williams), showed *Cattleya labiata Lisburniana*, a large variety with rich rose-coloured flowers, the labellum bearing a crimson veining.

Captain HOLFORD, Westonbirt, Tilbury (gr., Mr. A. Chapman), showed *Cypripedium* × *Statterianum*, Holford's variety (*Spicerianum magnificum* × *vexillarium*), a showy flower with large, reflexed, white upper sepal heavily tinged with dark rosy-lilac.

J. T. BENNETT-POE, Esq., Holmwood, Cheshunt (gr., Mr. Downes), showed the true *Vanda insignis*, with fine broad rose-coloured labellum.

Mr. JAS. DOUGLAS, Edenside, Great Bookham, showed a group of cut blossoms of very good forms of *Cattleya labiata*, several of the varieties being very brilliant, with great depth of colour (Bronze Medal).

Fruit Committee.

Present: G. Bunyard, Esq., in the chair; and Messrs. W. Poupert, J. Cheal, A. H. Pearson, J. Wright, A. Dean, C. Herrin, W. Bates, G. Woodward, G. Wythes, F. Q. Lane, J. Smith, W. Empson, and J. H. Veitch.

Messrs. SUTTON & SONS, Reading, exhibited sixteen fruits of one of Mr. Owen Thomas' newly raised Cucumbers, named by them Sutton's Everyday. It is apparently a variety which develops perfectly at the dull season, the fruits shown being 1 foot 8 inches long and 3 inches in diameter where thickest. If it will thicken approximately as much in mid-winter, it will be an undoubted acquisition. The colour of the rind is dark green.

Mr. W. BYGROVE, gr., Rous Tuck Court, Evesham, showed a dish of well-filled pods of *Pea Charles I*.

A small number of dishes of new varieties of Apples were shown, but the committee were difficult to please, and no award was made.

A Cultural Commendation was made to Mr. J. VERT, gr.,

Audley End, for *Cucumber Vert's Favourite*, a slender and slight ribbed fruit.

The most striking feature of the meeting was the very extensive collection of Apples shown by Messrs. BUNYARD & Co. of Maidstone, consisting of about 100 dishes of sterling varieties cultivated in gardens and orchards in this country—of course, excepting *Cider-fruit*. The fruits were generally as remarkable for fine development as for high colour in all cases where the natural tint is not green. We do not remember to have seen more or brighter colour in Apples in any previous year. (The Society's Gold Medal was awarded.)

THE SCOTTISH HORTICULTURAL ASSOCIATION.

NOVEMBER 1.—The last meeting of this body of gardeners was held in St. Andrews Hall, Edinburgh, on the above date, being attended by about 100 members, Mr. TODD in the Chair. In the absence of Mr. Donald, of Ferguslie, Paisley, through domestic affliction, Mr. A. Laird, the secretary, read his paper on "The Chrysanthemum as a Plant for Cutting and Conservatory Decoration." The lecture gave the history of the various types now existing.

The lecturer dealt with the subject somewhat exhaustively, dealing with standard varieties in each class, with potting, manuring, and cultural details, and his remarks received close attention from those present.

A hearty vote of thanks was then passed to Mr. McDonald for his paper; and the President announced that it was anticipated that the coming show would prove a greater success than even that of last year.

As this was the last meeting before the show, not much was exhibited, though it was a more crowded meeting than any other of the session. The dwarf magenta coloured variety of *Chrysanthemum*, which is likely to prove valuable for foregrounds, very floriferous, and about a foot high, named *Madame Marie Massé*, came in fine form from Mr. MOLLAM, of Trinity Cottage. Messrs. GRIEVE & SON also sent a promising seedling *Chrysanthemum*, *The Scotchman*; Mr. DALGLEISH, a fine-sized, delicate coloured seedling *Begonia*; Mr. LITTLE, *Largie Castle*, *Tayinloan*, a nice collection of flowers of *Hydrangea Hortensia* cut from open-air plants; Mr. CHAPLIN, St. Leonards, Edinburgh, sent a fine specimen of *Begonia Gloire de Lorraine*; the President, Mr. TODD, showed a charming vase filled with flower-buds of *General Jacqueminot Rose*, dainty as if it were June instead of November, and a vase of *Chrysanthemum* blooms, grasses, and *Asparagus plumosus*, notable among the former being *Source d'Or*, *rs. Watson*, *Vivian Morell*, *Globe d'Or*, and *W. H. Lincoln*. D. T. F.

HEREFORD FRUIT AND CHRYSANTHEMUM.

NOVEMBER 1, 2.—This Society held its seventh annual show in the Shire Hall, Hereford, and there was a splendid display of Apples and Pears. The former were better shown than at any previous show, and were remarkable for their high colour.

Mr. WATKINS, Pomona Farm, had an exceptionally fine collection of fifty dishes, and also a hundred dishes of distinct varieties, which he staged for exhibition only. Mr. PITT, Abergavenny, had twenty-four dishes of Pears in excellent condition; but the best samples of these fruits were undoubtedly the twelve dishes shown by Mr. Ward, gr. to Lady EMILY FOLEY, Stoke Edith Park.

Chrysanthemum blooms were fairly good, but there was a falling off in competition in the classes for groups.

Open classes.—APPLES, fifty dishes, distinct. Four competitors entered in this class, and Mr. WATKINS obtained a good lead, with large, highly-coloured fruits. In his collection was a dish of *British Queen*, a very handsome fruit of excellent flavour, supposed to be a cross between *King of the Pippins* and *Blenheim Orange*. 2nd, Messrs. FEWTESS Bros., Gillington.

For a collection of thirty dishes of Apples, distinct, six exhibitors entered; Mr. WARD, with large, bright fruits being 1st; and Mr. Smith, gr. to R. C. MITCHELL, Esq., Moreton Court, a close 2nd.

For thirty dishes of Pears, distinct, Mr. PITT, Abergavenny, was 1st, with fine fruits, some of his best being *Beurré Diel*, *Pitmaston Duchess*, *Thompson's*, *Marie Louise*, *Beurré Superfin*, *Emile d'Heyst*, and *Comte de Lamy*. Mr. WATKINS was a close 2nd.

Mr. WARD was 1st for twelve dishes, distinct, with fine clean fruits, viz., *Glou Morceau*, a grand dish; *Beurré Hardy*, *Doyenné du Comice*, *Durondeau*, *Thompson's*, *Marie Louise*, and *Beurré Superfin*. The latter was a very fine dish, but somewhat out of character, the result of double grafting; 2nd, Mr. Grindrod, gr. to G. F. BATES, Esq., Whitfield.

The best dish of a culinary Apple was *New Hawthornden*, from Mr. WATKINS; and the best dish of dessert, one of *Cox's Orange Pippin*, from Mr. J. DAVIS.

The largest dish of PEARS, five fruits, was from Mrs. BLASHELL, Bridge Sallars Farm, being a magnificent dish of *Pitmaston Duchess*, the heaviest fruit weighing 2 lb. 3 oz., grown upon an espalier tree, which carried a good crop.

AMATEURS.

In the class for twenty-four dishes of Apples, twelve culinary and twelve dessert, Mr. R. N. WITING, Credenhill, Hereford, was 1st, with a creditable lot of clean fruits, the

best being King of the Pippins, Egremont Russet, Claygate Pearmain, Cox's Orange, Emperor Alexander, and Bismarck.

The best twelve dishes of culinary Apples were from Mr. Nunn, gr. to J. WOODHOUSE, Esq. In this collection Lord Derby, Warner's King, New Hawthornden, Cellini, and Emperor Alexander were conspicuous dishes; 2nd, Mr. J. Davis, gr. to W. E. KING KING, Esq., Bodenham. Eleven entered in this class.

In the class for eight dishes of dessert Apples, several of the eighteen exhibitors were disqualified for including kitchen varieties. Mr. GRINDROD was deservedly 1st, having Cox's Orange, Egremont Russet, Ribston Pippin, Adams' Pearmain, Blenheim Orange, &c.; 2nd, Mr. WATKINS.

PEARS, eight dishes, 1st, Mr. RICK, gr. to G. H. HADFIELD, Esq., Moraston, Ross, with capital dishes of Josephine de Malines, Pitmaston Duchess, Doyenné du Comice, Marie Louise, Durondeau, &c.

Non-competitive Exhibits.—Mr. C. WRITING, White Cross Nursery, Hereford, staged sixty dishes of splendid Apples; and THE ENGLISH ROSE COMPANY, Hereford, staged eighty dishes of Apples and Pears. Mr. WILSON, florist, Commercial Street, Hereford, exhibited some beautiful wreaths, crosses, and bouquets.

CHRYSANTHEMUMS.

For thirty-six Japanese blooms, 1st, Mr. Robinson, gr. to G. HARLEY, Esq., Brampton Bryan, his best being Edith Tabor, Australe, G. C. Schwabe, and E. Molyneux.

For twelve Japanese blooms, 1st, Mr. Davis, gr. to A. W. G. WRIGHT, Esq., Quarry House, with good blooms of Com. Blussett, Madame Briant, Australie, M. Pankoucke, &c.

For twelve incurved blooms, 1st, Mr. ROBINSON; 2nd, Mr. DAVIS.

The best group of Chrysanthemums, in a space 12 feet by 7 feet, was from Mr. Williams, gr. to Sir J. PULLY, Bart.; and the best group of flowering and foliage plants, upon a space 10 feet by 7 feet, was from Mr. Fox, gr. to Captain COTTRELL, The Garnons. *Thos. Coomber.*

TORQUAY DISTRICT GARDENERS'.

NOVEMBER 1, 2.—The above held their fourth annual autumn exhibition on the above date.

Mr. C. R. PROWSE, gr. to Dr. W. FORD EDGELOW, won the National Chrysanthemum Society's Silver Medal with a most effective group; and Mr. J. AGGETT, gr. to Mrs. CUMMING, was 1st in the smaller groups. Mr. J. STILES, gr. to Rev. G. LYONS; Mr. R. W. HODDER, gr. to Mrs. TREVOR BARKLEY; and Mr. W. R. SATTERLY, gr. to Mrs. RAWSON, were the chief prize-winners in the cut-flower classes. Mr. H. R. JONES, gr. to F. P. T. STRUBEN, Esq., staged a splendid display of fruit; and the local gardening class of the Technical Education Department, made a good show of vegetables.

EALING HORTICULTURAL.

NOVEMBER 2.—One of the best Chrysanthemum shows held in Ealing was seen in the Victoria Hall on this date, and the incurved varieties were in good form. Some miscellaneous exhibits of a high order of merit were also staged, and probably the fine Hall was never before seen to better advantage.

Groups were very good; the flowers of more than average quality. Mr. C. EDWARDS, gr. to H. W. PEAL, Esq., Ealing, had the best of the large; and Mr. R. DOWSING, gr. to C. O. CHAMBERS, Esq., Ealing, the best of the small ones. Mr. T. HOGG, gr. to A. G. DIXON, Esq., was 1st with a group of miscellaneous plants, Orchids in good variety being prominent in it.

Specimen plants of Chrysanthemums were the least satisfactory feature of the show.

Some very fine incurved blooms were shown by Mr. LONG, gr. to E. P. OAKSHOTT, Esq. Mr. H. KNIGHTLEY, gr. to N. ROBINSON, Esq., had the best six varieties, the old yellow, Mr. Bunn, being very good.

Mr. OAKSHOTT was 1st with twelve blooms of Japanese. The six best blooms of any one variety were those of Mutual Friend from Mr. OAKSHOTT.

There were classes for reflexed varieties, Anemone-flowered, Pompons, &c., all being represented; and, in addition, there were epergnes, bouquets, &c., of Chrysanthemums, and they made a very pleasant feature.

In the way of miscellaneous exhibits, Mrs. H. B. SMITH, Ealing, had high-class floral decorations. From Gunnersbury House Gardens, Mr. J. HUDSON brought fine specimens of Begonia Gloire de Lorraine and Lilium nepalense. Mr. GEO. REYNOLDS sent from Gunnersbury Park plants which had a charming effect in the front of the orchestra. Mr. COLLIER, gr. to Sir E. M. NELSON, Hanger Hill House, had a fine collection of Apples and Pears; and Mr. GEO. CANNON, nurseryman, Ealing, a large group of Palms and Chrysanthemums. *R. D.*

WARGRAVE AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

NOVEMBER 2.—A fortnightly meeting was held in the parish room, Wargrave, Mr. W. POPE presiding over a good number of members.

The attraction of the evening was the first of a course of lectures on Botany by Mr. J. W. GROVES, F.L.S., late Professor of Botany at King's College, London. At the outset the lecturer mentioned the various branches of the science, and stated that he should confine his attention to that branch

most particularly useful to the members as gardeners, viz., "The Structure and Life-History of Plants." He proposed to deal with the subject under the heads of (1) Cells; (2) Stems; (3) Roots, Leaf-stalk, and Leaf; (4) Flowers; (5) Fertilisation, Seed, and Fruit; (6), Germination, &c.; taking them up at alternate meetings of the Society, and illustrating his lecture with the magic lantern and microscope. "Cells," therefore, formed the subject of Wednesday's lecture, and the Professor gave an exceedingly clear and well illustrated answer to the question, "What is a cell?"

The Chairman, gr. to J. P. WHITE, Esq., The Willows, exhibited a group of fine-foliage plants, comprising Heliconia illustris rubricaulis, Anthurium Warocqueanum, Maranta zebra, Pandanus Veitchii, Leea amabilis, &c., which were greatly admired. *H. Coleby, Sec.*

KENT COUNTY CHRYSANTHEMUM.

NOVEMBER 2.—The spacious Drill Hall at Blackheath looked very pleasant indeed on the above date, for it was filled with Chrysanthemums and other plants, and there were also tables full of cut blooms.

There were charming groups of Chrysanthemum plants, well grown and bloomed, and set up with appropriate foliated plants. The best, a very meritorious one, came from Mr. E. DOVE, gr. to H. E. FRY, Esq., Bickley Hall; Mr. A. W. HOLLANDS, Leigh Park Nursery, was a good 2nd.

The leading class for cut blooms was for thirty-six, eighteen to be Japanese and eighteen incurved, distinct. Mr. T. ROBINSON, gr. to W. LAWRENCE, Esq., Hollingbourne, was placed 1st with some very good blooms indeed; his leading incurveds were C. H. Curtis, Miss Violet Foster, Miss M. A. Haggas, Mrs. J. Murray, Mr. R. Bahuant, Globe d'Or (a very bright pale golden variety), Empress of India, Leonard Payne, Golden Nugget, and Lord Wolseley; his finest Japanese, Mrs. J. Lewis, Australie, Madame Carnot, M. Pankoucke, Miss Ella Curtis, N. C. S. Jubilee, Mrs. Weeks, Madame Berger, and Pride of Madford. Mr. C. PAYNE, gr. to C. J. WHITTINGTON, Esq., Bexley Park, was 2nd.

There was a good competition with twenty-four Japanese. Mr. H. HURST, gr. to W. T. HOLLAND, Esq., Bexley, was 1st, having in fine character Lady Byron, Eva Knowles, G. C. Schwabe, N.C.S. Jubilee, R. Powell (a fine incurved Japanese), Simplicity, E. Molyneux, Charles Davis, Madame G. Henry, Australie, &c.; Mr. J. BLACKBURN, gr. to J. SCOTT, Esq., Chislehurst, was 2nd.

There was a good competition in the class for twelve Japanese, Mr. HURST being again 1st, and Mr. J. LYNE, gr. to H. T. TEAKES, Esq., Chislehurst, 2nd.

Incurved varieties were somewhat weak in the classes set apart for them. The best twelve came from Mr. OSMAN, the Gardens, Ottershaw Park, Chertsey; Mr. J. LYNE was 2nd.

Mr. C. RUSSELL, gr. to T. PIM, Esq., Crayford, had the best six blooms of incurved, one variety, having Baron Hirsch in good character.

Mr. OSMAN had the best six blooms of a white variety of Japanese, staging fine examples of Mutual Friend. The best six blooms of a coloured variety were those of Col. W. B. SMITH.

There were smaller classes for Japanese and incurveds, and also for reflexed and Pompons, the amateur classes being well filled.

The first of the President's special prizes for eight Japanese, eight incurved, and eight reflexed, was won by Mr. J. LYNE with good representatives of each type.

Mr. LYNE was 1st with a group of flowering and foliated plants—an excellent arrangement, enriched with Orchids, the brilliant Clorodendron fallax, &c. Some good table plants were also shown by Mr. LYNE.

Fruit.—There were a few classes for fruit. Mr. LYNE had the best two bunches of Black Grapes, showing well-finished Allcote; and Mr. W. TAYLOR, gr. to C. BAYER, Esq., Forest Hill, was 2nd, with two fine bunches of Gros Colman, but which lacked colour. The latter was 1st with White Grapes, having good Muscat of Alexandria. Dessert and culinary Apples and dessert Pears were also exhibited.

In the way of miscellaneous exhibits, Messrs. GEO. BUNYARD & Co., Maidstone, had about 100 dishes of Apples and Pears; a smaller collection came from Messrs. J. LAING & Sons, Forest Hill. Mr. H. J. JONES, Ryecroft Nursery, Lewisham, had a table of cut Chrysanthemums. Some Catleya blooms from Mr. J. CARVELL, and a few other subjects, found a place on the tables.

WOLVERHAMPTON CHRYSAN- THEMUM.

NOVEMBER 2, 3.—The annual exhibition of this Society was held in the Drill Hall on the above dates, and in the number and quality of the exhibits it was quite as successful as any former show.

This year being the jubilee of the incorporation of the town, the Society decided to offer for competition three Silver Cups—one valued £10, as 1st prize, in addition to the money award, for a group of Chrysanthemums, and which has to be won twice; the other two Cups, valued at £5 each, were allotted respectively to a class for thirty-six Japanese blooms, distinct, and a class for thirty-six incurved blooms. These Cups were also given as additions to the money awards as 1st prizes, and became the property of the winners on the first occasion.

The committee was wise in allowing the exhibitors to use a few foliage plants in the groups of Chrysanthemums, as the Chrysanthemum groups this year were undoubtedly the best that have been seen at Wolverhampton

for some time. The few graceful Palms and narrow leaved Crotons which were interspersed among the Chrysanthemums not only prevented the usual formality, but at the same time obviated the crowding together of the Chrysanthemum blooms.

Another improvement has been made in the schedule by omitting the class for twenty-four incurveds and twenty-four Japanese blooms, and substituting in their stead two classes, one for thirty-six Japanese blooms, distinct, and the other for thirty-six incurved blooms, in not fewer than eighteen varieties; the former class very seldom being satisfactory to the exhibitor who may be strong in one section, but weak in the other.

OPEN CLASSES.

For the group of Chrysanthemums there were three entries. The arrangement of the plants, the quality of the blooms, and the blending of the colours left nothing to be desired. 1st, Mr. W. SHINGLER, gr. to T. G. BAKER, Esq., Compton; 2nd, Mr. G. BRADLEY, gr. to Miss PERRY, Wergs Hall, Wolverhampton.

Groups of miscellaneous plants arranged for effect, four entries. 1st, Alderman C. T. MANDER, J.P., The Mount, Compton; Mr. Minton, gr. to F. SANDERS, Esq., Oaken, 2nd.

Chrysanthemum plants were well shown, Alderman T. C. MANDER and Mrs. EARP carrying off the principal prizes. Mr. R. M. SHELTON, Springfield House, Oaken, was 1st for Chinese Primulas.

In the cut-bloom classes, very strong competition was experienced, the flowers throughout being of high quality and well set up. For thirty-six incurveds, not fewer than eighteen varieties, nor more than two of any variety, Mr. F. G. FOSTER, Brockhampton, Havant, was awarded 1st prize. Mr. J. H. GOODACRE, gr. to Earl HARRINGTON, Elvaston Castle, Derby, being a very close 2nd.

The class for thirty-six Japanese blooms, distinct, brought six competitors, and was very keenly contested, Earl SPENCER carrying off the premier award with thirty-six perfect blooms; Messrs. J. R. PEARSON & Sons, Chilwell, Notts, were 2nd. Messrs. PEARSON were also 1st for twelve incurveds and twelve Japanese blooms followed in each class by Mr. J. H. GOODACRE.

For two bunches of black Grapes, Mr. J. READ, gr. to the Earl of CARNARVON, was 1st and Mr. F. SANDER was 1st for white Grapes. Apples and Pears were well shown, Colonel the Hon. S. COTTON, Somerford Hall, Mrs. Z. LLOYD, and Earl SPENCER taking chief honours. First-class collections of vegetables were staged by Earl SPENCER, Mr. J. READ, and Alderman T. C. MANDER.

Non-competitive collections of cut-flowers, plants, and fruit were very good, and welcome additions to the exhibition. Messrs. JONES & Son, nurserymen, Shrewsbury, made a superb display with cut-blooms of Cactus-Dahlias. Mr. J. E. KNIGHT, nurseryman, Wolverhampton, contributed a floral display, consisting of a chaplet of white Chrysanthemums and Orchids, an anchor of yellow Chrysanthemums, and some beautiful wreaths. Mr. ROBT. LOWE, seedman, of Wolverhampton, showed magnificent wreaths, crosses, and bouquets. Messrs. T. RIVERS & Sons, Sawbridgeworth, staged a fine collection of Apples and Pears. *G. W.*

PORTSMOUTH.

NOVEMBER 2, 3.—The committee of the Portsmouth Chrysanthemum Society, of which Mr. GILL is President, and Mr. W. H. BERRY is Hon. Sec., were fortunate in being able to hold their annual autumn show in the Portsmouth Town Hall, and no better place could be found for the purpose of a show. Unfortunately the weather was wet on the opening day, keeping many persons away. The display was the best they have had under the new manager.

Cut blooms were well staged. The principal class was that for forty-eight blooms, half to be incurved and half Japanese, and substantial prizes were offered. There were four entries in this class, making a good display. Mr. C. PENFORD, gr. to Sir F. FITZWYGRAM, Bart., Leigh Park, was 1st, owing chiefly to the superiority of his Japanese blossoms which were large and bright, and well arranged as regarded colour. The incurved specimens were irregular, some being especially fine, while others were weak. Mr. W. G. ADAMS, Clarendon Road, Southsea, was 2nd, with a weighty stand of well-finished incurved blooms, rather weak in Japanese varieties. Mr. FOSTER, Brockhampton nurseries, was a close 3rd.

In the twenty-four Japanese class, not fewer than eighteen varieties, Mr. J. AGATE, The Nurseries, Havant, was 1st with fine, fully-developed specimens of leading varieties. Mr. PENFORD was 2nd. In the class for twenty-four incurved varieties, Mr. PENFORD was 1st, with a fairly good collection. The amateurs staged creditable examples of Japanese, Mr. WHITE being the most successful exhibitor.

Growers in Portsea Island had classes set apart for them, which they worthily filled, and Mr. WHITE and Mr. ADAMS were the chief prize-takers; the former fortwenty-four Japanese, and the latter for the same number of incurveds.

Miss TURNER was 1st for table decoration, in which she employed bronze-coloured Chrysanthemums, though somewhat rather too freely. Messrs. W. TURNER & Sons were 1st for a bouquet of Chrysanthemums, with an arrangement superior to those usually met with. Mrs. G. H. MARSHALL, Southsea, had a gracefully decorated epergne, for which the 1st prize was awarded to her.

Groups of Chrysanthemums and foliage plants were of fair quality, Mr. AGATE being 1st with plants having good blooms, poorly arranged; Mr. FOSTER was 2nd. Messrs. BEVANS, of Langport, and HANCE, of Buckland, secured the leading awards for plants in the open and amateur classes.

ASCOT CHRYSANTHEMUM.

NOVEMBER 2, 3.—In very wet weather this Society opened its fifteenth show of Chrysanthemums, fruit, and vegetables, at the Grand Stand, Ascot, on the above date. Three classes were for groups, and two of them were well contested; the miscellaneous class brought two very moderate groups only.

For the best group of Chrysanthemums and foliage, mixed, there were four entries, and H. T. LESCHALLS, Esq., The Highams, Windlesham (gr., Mr. W. L. Farmer), won 1st prize. The best group of Chrysanthemums was shown by the Marchioness CONYNGHAM, The Mount, Ascot (gr., Mr. H. White).

The cut blooms in the open classes were poor, but greater competition was manifest in the district classes.

There were fine exhibits of fruit and vegetables.

PAISLEY HORTICULTURAL.

NOVEMBER 3.—The opening meeting of the third session of the Renfrewshire Gardeners' Mutual Improvement Society was held in the George Temperance Hotel, Paisley, on the above date. Mr. Robert Macfee presided.

Mr. S. Dewar, curator of the Glasgow Botanic Gardens, delivered an address on "Artificial Manures." He treated the subject in a scientific and practical manner, showing the necessity for plant-food, and how the ingredients of these manures supplied what was required for the sustenance of plants. He showed also that different plants required different manures, and one of the secrets of success in horticulture was to know what manures to apply. An interesting discussion followed, turning chiefly on the merits of farmyard and artificial manure. A Vote of Thanks was awarded Mr. Dewar.

PUTNEY, WANDSWORTH, & DISTRICT CHRYSANTHEMUM.

NOVEMBER 3, 4.—The Putney Society this year held its twenty-first exhibition in the Town Hall, Wandsworth, a building in every way suitable for a display of flowers. When the plants and flowers had been arranged, the picture was a very beautiful one, and the committee and hon. secretary, Mr. J. F. McLeod, are to be congratulated.

The Japanese blooms in the Commemoration Challenge Cup class, and in the class for twelve vases of Chrysanthemums, were of very high quality. Incurveds, with a few exceptions, were not so good, but this appears to be a common failing. There were berried, Chrysanthemum, and Primula plants, fruits, and vegetables, making altogether a very pretty exhibition.

The Tradesmen's Challenge Cup (value twenty-five guineas) was won by the exhibitor to whom it was awarded last season, viz., Mr. G. J. Hunt, gr. to PANTIA RALLI, Esq., Ashstead Park, Epsom, whose personal property it has now become. It is offered for the best sixty blooms, thirty-six Japanese, twelve incurveds, and twelve Japanese incurveds. His exhibit was certainly one of which the society had reason to be proud. The incurveds included a magnificent bloom of Duchess of Fife, of unusual size and fine build, being the premier incurved bloom in the show. The Japanese varieties were more even. The 2nd prize went to Mr. F. King, gr. to A. F. PERKINS, Esq., Oak Dene, Holmwood, Surrey. Among the Japanese in this collection was a perfect bloom of Phœbus, that won Mr. GEORGE'S prize for the best Japanese bloom in the show. Mr. J. F. McLeod was 3rd in this class, all three exhibits were very even, there being but few points between the 1st and 3rd prize collections.

The best collection of thirty-six blooms, with stems and foliage attached, disposed in twelve vases, was also from Mr. G. J. HUNT, and he had some very fine ones indeed, Duchess of Fife, Edith Tabor, Australie, Graphic, and Ed. Molyneux were the best. There were two other collections, but the 2nd prize was won by Mr. J. F. McLeod, gr. to J. P. MORGAN, Esq., Dover House, Roehampton, who had Sunflower in its best condition. There were three exhibitors.

In the twenty-four blooms (Japanese) class, the victor was Mr. J. Darg, gr. to J. HOOKER, Esq., Lombard House, Putney. He had nice fresh-looking, well-coloured, but rather small blooms, and included too many yellow and bronze-coloured flowers.

The classes for twenty-four incurveds, twelve, and six, were not remarkable. Mr. CHAS. BENTLEY had the best single-flowered varieties, the best Pompons, and best reflexed varieties.

Mr. S. MYNETT gained the special prize offered by Mr. J. F. McLeod, for an epergne of Chrysanthemum bloom, arranged with foliage and grasses, and a special prize offered by Mr. GEORGE STEVENS for a basket of Chrysanthemums and ornamental foliage.

Plants.—The 1st prize for a collection of Chrysanthemums in pots in not fewer than twenty varieties, was won by Mr. W. Tew, gr. to Mrs. E. GORDON, Westcombe Lodge, Parkside. He had a group after the usual pyramidal style of arrangement. Many of the Japanese varieties in the group were good, but the incurveds were scarcely represented.

Specimen-trained and bush-plants were exhibited in various classes, and 1st prizes were taken by Mr. French, gr. to Mrs. BARCLAY, Ambleside, Wimbledon Common; Mr. Jno. C. TWILLEY, 178, Merton Road, Wandsworth; Mr. CHAS. BENTLEY, gr. to Major BOSWORTH, Cedar Court, Roehampton, who won numerous 1st prizes; Mr. S. Mynett, gr. to J. CARLISLE, Esq., Ashburton House, Putney Heath; and ALFRED LANE, Esq., 244, Upper Richmond Road, Putney.

Fruit and Vegetables.—These exhibits were choice and of good quality. Mr. CHAS. BENTLEY had the best Black Grapes in Gros Maroc; and Mr. A. Methven, gr. to W. KEILLER, Esq., Fernwood, Wimbledon Park, the best white in Muscat of Alexandria. Mr. CHAS. TAYLOR had the best culinary and dessert Apples, and Mr. METHVEN the choicest Pears.

Miscellaneous.—Messrs. JAS. VEITCH & SONS, of Chelsea, exhibited a large group of choice plants. The Palms, Codiaums, &c., were relieved by a few greenhouse Rhododendrons in bloom, and Acalypha Sanderiana. Mr. ROBERT NEAL, of Trinity Road Nurseries, Wandsworth, also showed a group of plants. Florists' specialties were shown by Mr. GEO. STEVENS, Putney, Mr. W. HOLMES, Upper Richmond Road, Putney, and Messrs. J. WALBORN & SON, High Street, Putney, who had the best wreath and hand-bouquet in the competitive classes.

MAIDENHEAD CHRYSANTHEMUM.

NOVEMBER 3, 4.—The first show of this newly-formed society was held on the above dates in the spacious town hall, a building well adapted for the purpose. A very good schedule of prizes was offered, and although the competition in some instances was not so keen as might be wished, a very good show was the result.

In the largest open class, that for thirty-six blooms, twenty-four to be Japanese and twelve incurved, Mr. J. Fulford, gr. to F. D. LAMBERT, Esq., Moor Hall, Cookham, scored a somewhat easy 1st with superb flowers of both Japanese and incurved types. Conspicuous among the former were G. J. Warren, Mrs. J. Lewis, Australie, and Madame Carnot; 2nd, Mr. G. Lane, gr. to Miss RINGE, Highfield, Englefield Green.

For eighteen Japanese blooms, distinct, arranged on a space 5 feet by 3 feet, with the addition of any kind of foliage plants or foliage, Mr. Wood, gr. to the Rt. Hon. Lord Boston, Hedsor, Maidenhead, came 1st, with a very nicely arranged exhibit, the blooms also being very fine; 2nd, Mr. W. Davis, gr. to H. ADAMS, Esq., Cannon Hill. Mr. Fulford was again successful for twelve Japanese, with a very good stand.

For six Japanese of one variety Mr. FULFORD came a somewhat easy 1st, with grand blooms of Oceana. For twelve incurved blooms, distinct, 1st, Mr. D. HAYLER; 2nd, Mr. Butt, gr. to Captain FARWELL, Burnham Priory. With six fine blooms of Duchess of Fife, Mr. Wood was well to the fore for that number of incurved of one variety. Mr. Wood was also 1st for twelve Anemones, a very good stand. With a stand of Pompons Mr. HAYLER was 1st. The best Japanese bloom in the show was in a very fine flower of Mrs. J. Lewis, a large reflexed white, of fine substance, in Mr. FULFORD'S stand; and the best incurved, a fine C. H. Curtis, from Mr. G. LANE.

Mr. Wood was 1st for two vases of Chrysanthemums, containing six blooms, and for a basket of cut Chrysanthemums.

For a dinner-table decoration arranged with Chrysanthemum blooms and any sort of foliage, Mrs. HERRIN, Dropmore, was well 1st. Mr. E. F. SUCH was 1st for a hand-bouquet, and Mr. FULFORD for table plants.

Groups.—Some nice groups were arranged. For that composed of Chrysanthemums, Mr. DAVIS was a good 1st; and a very pretty group of miscellaneous plants came from Mr. Mr. FULFORD.

Fruit.—Mr. FULFORD was 1st for White Grapes, and Mr. GOODMAN 1st for Apples.

For a collection of vegetables, Mr. Paxton, gr. to Hon. C. J. IRBY, was 1st.

Non-competitive exhibits included a large stand of Chrysanthemum blooms from Mr. R. Owen; a quantity of floral decorations and cut Chrysanthemums in baskets from Mr. E. F. SUCH; floral decorations from Miss BROUGHTON; while Messrs. BUNYARD & Co., of Maidstone, sent a collection of some sixty varieties of Apples.

DEVON AND EXETER HORTICULTURAL FRUIT AND CHRYSANTHEMUM.

NOVEMBER 3, 4.—This was the 186th exhibition of this Society, and, on the whole, it may be regarded as a successful one. Fruit was well shown, the quality being rather above the average. In Chrysanthemums, the groups were better than usual; but in cut-blooms the competition was weak, and the quality lacking.

The cause of this falling off was mainly due to the Plymouth Exhibition, where the prizes are higher, being held at the same time, and, in a lesser degree to the shows at Dawlish, Newton Abbot, and Budleigh Salterton, being also held simultaneously.

CHRYSANTHEMUMS: CUT BLOOMS.

For thirty-six Japanese, distinct, H. HAMMOND-SPENCER, Esq., Teignmouth (gr., Mr. G. Foster), was 1st, taking also the National Chrys. Society's Certificate; Sir JOHN SHELLEY, Shobrooke (gr., Mr. R. Mairs), was 2nd. Mr. FOSTER had good blooms of Australie, Graphic, Beauté Grenobloise, Oceana, Simplicity, Lady Ridgway, Charles Davis, Madame Carnot, an even and fresh-looking, but not overgrown lot of flowers. Mr. Mairs showed Mrs. C. H. Payne, Charles Shrimpton, Lady Ridgway, National Chrysanthemum Society Jubilee, and Madame Carnot, very well.

In the eighteen Japanese, distinct, positions were reversed, Mr. MAIRS being 1st, and Mr. FOSTER 2nd. In this class Mr. Mairs again showed N. C. S. Jubilee and Lady Ridgway in fine form.

In the class for twelve Japanese, distinct, J. W. C. WASHINGTON, Esq., Dawlish (gr., Mr. W. Smeester), was 1st.

For six white, one variety, the Rev. E. E. HEATHCOTE REEVE (gr., Mr. T. Tucker), was 1st, with Madame Carnot, well shown; Mr. MAIRS being a close 2nd, with the same variety.

For the best six yellows, one variety, the Rev. G. LYONS, Teignmouth (gr., Mr. J. Stiles), was 1st, with fine blooms of Phœbus, to one of which was awarded the distinctive prize for "the best bloom in the show." It was a fine full bloom of great depth, although slightly pale in colour. Mr. MAIRS was 2nd with Edith Tabor.

In the class for six Japanese of any other colour, Mr. MAIRS was 1st, for blooms of Beauty of Teignmouth.

For incurved Japanese, twelve blooms, there was but one competitor, the Rev. G. LYONS, whose best blooms were Directeur Liebert, Oceana, Lady Ridgway, and N. C. S. Jubilee.

In the amateurs' classes, Mr. C. ELMS was 1st, and included Phœbus and Milano; Mr. C. HAM being a close 2nd, with Phœbus, Mons. Hoste, and Belle Mauve in very good form.

PLANTS IN GROUPS.

Chrysanthemums in pots, not fewer than eighteen varieties, in a circle of 10 feet diameter, quality of bloom to be the first consideration, effect next. W. BROCK, Esq., Exeter (gr., Mr. Rowland), took premier place, scoring chiefly in quality of bloom, showing brightness and diversity of colour, and good foliage; Lady DUCKWORTH, Exeter (gr., Mr. W. R. Baker), was a close 2nd. While lacking in quality of bloom, and perhaps having a preponderance of light colours, Mr. Baker's group had a superior finish, with many well-flowered plants round the edges not more than a foot high, while the highest ran up to 8 feet, with good foliage on them [all the way?].

For the best 8-feet-diameter-group, fifteen varieties, G. RANDALL JOHNSON, Esq., Heavitree (gr., Mr. G. Rogers), was 1st, and took the National Chrysanthemum Society's Certificate with a very good and uniform lot, beating another good group from T. KERKEWICH, Esq., Peamore (gr., Mr. J. Abrams).

In the Miscellaneous Groups there was nothing which calls for special remark, form and composition being on the same lines as in previous years. Mr. ROWLAND was 1st, and Mr. BAKER 2nd.

FRUIT.

Grapes.—Three bunches Black Alicante.—In this class the Rev. H. CLERK, Exmouth (gr., Mr. R. Pike), was an easy 1st, with three excellent bunches, form, size of berry, and amount of bloom being all that could be desired; Mr. G. W. MATHEW, of Exmouth, was 2nd. In Muscats of Alexandria matters were more even, Rev. H. CLERK being placed 1st, and Sir J. D. FERGUSON-DAVIE, Crediton (gr., Mr. W. Seward), 2nd.

In Apples, the competition was very close, the quality in all classes exceptionally high, and the entries numerous. As indicating the fine quality of the fruit, Blenheim Orange, which took premier honours at the Crystal Palace, was not placed here at all, and Ribston, which were 1st there, were 2nd at this show. For the collection of thirty varieties, fifteen dessert and fifteen culinary, all distinct, Sir JOHN SHELLEY was 1st, and won the Robert Veitch & Son's Silver Cup, with a splendidly coloured and typical collection of fruit, which included Baumann's Red Winter Reinette, Emperor Alexander, Mère de Ménage, Annie Elizabeth, Grand Sultan, Wealthy, Alexander Pippin, Adams' Pearmain, and Sturmer Pippin; Sir JOHN DAVIE was a close 2nd, with a splendid collection, which included Ecklinville Seedling, Red-ribbed Greening, Mère de Ménage, Alfriston, richly-coloured Blenheims, and others.

For five fruits, any other dessert variety, T. KERKEWICH, Esq., was 1st, with Claygate Pearmain. In the any other variety, culinary, Lord PORTMORE (gr., Mr. T. Slade) was 1st, with particularly fine examples of Alfriston; the 2nd prize going also to the same variety. For the best-flavoured, the premier place was, as usual, given to Cox's Orange Pippin, staged by J. H. LEY, Esq., Trebell (gr., Mr. J. S. Harding).

For the best single specimen, Sir JOHN DAVIE was 1st, with Blenheim Orange Pippin, one of the largest and handsomest specimens probably ever staged at Exeter.

Pears.—In Pears, premier honours went to Sir ARTHUR ACLAND, Killerton (gr., Mr. J. Garland), for nine varieties, six dessert and three culinary. Among his best were Beurré Diel (one of which weighed 23 oz.), Durondeau, Doyenné du Comice, Pitmaston, Catillac, and Uvedale's St. Germain.

In the six varieties class, Mr. GARLAND was again 1st, with good dishes of the same varieties. In each case Sir JOHN SHELLEY was a close 2nd.

In the any other dessert variety, Conseiller de la Cour was placed 1st; and for the best-flavoured, Sir JOHN SHELLEY secured 1st place with Doyenné du Comice. The prize for the single specimen, any dessert variety, went to F. R. HEARN, Esq., Alington (gr., Mr. G. Anning), who showed Pitmaston Duchesse in fine form.

Among the honorary exhibitors were R. ASHBY, Esq., Matford House (gr., Mr. Merritt), who staged a very fine lot of Orchids, including grand plants of Cattleya labiata autumnalis, Dendrobium Schroderianum, D. formosum giganteum, Lycaste Skinneri, Orlontoglossum Bictonense, Oncidium lychnorhynchum, O. varicosum, and Cypripedium Spicerianum. W. PRING, Esq., Miss DREW, and Mr. HENRY HILL were among the honorary exhibitors.

TRADE EXHIBITS.

These came from Messrs. R. VEITCH & SON; THE EXETER NURSERY CO.; JARMAN & Co., Chard; and G. C. SCLATER, Heavitree.

The Hon. Sec., Mr. G. D. CANN, and his assistant, Mr. F. W. PARKER, made admirable arrangements. A Correspondent.

PLYMOUTH.

NOVEMBER 3, 4.—The West of England Chrysanthemum Society held their annual autumn exhibition in the Guildhall on the above dates. The quality of the various exhibits was excellent, and in no particular behind those of former years. Cut blooms were undoubtedly the feature of the show.

For forty-eight, in twenty-four varieties, Mr. G. W. DRAKE, Cathay's nursery, Cardiff, was adjudged the premier award, with an almost faultless collection of blooms; Mr. G. Foster, gr. to H. HAMMOND-SPENCER, Esq., Glendaragh, Teignmouth, was a really good 2nd; Mr. W. H. FOWLER, Claremont, Taunton, a capital 3rd.

For twenty-four Japanese, the premier award was secured by Mr. G. Stiles, gr. to Rev. G. LYON, Teignmouth, with an imposing stand of blooms that showed great cultural skill; Mr. FOSTER was 2nd.

For twelve Japanese, Mr. G. H. Paddon, gr. to H. LEAH, Esq., Trevervene, was 1st in a spirited competition, with even, full-sized, well-coloured examples of popular varieties. The same exhibitor also secured the leading award in the class for six incurved Japanese.

Mr. Farmer, gr. to the Misses CAREW, Buckfastleigh, was 1st for six Japanese of any white variety, with grandly-developed blooms of Souvenir d'une Petite Amie; and Mr. PADDON was 1st for six Japanese of any other colour, staging magnificent blooms of Australian Gold. Mr. STILES followed with Phœbus, also in good trim.

For such an important society, the incurved varieties were indifferently shown and poorly selected; whilst, on the contrary, Anemone-flowered varieties were fairly well staged.

Good prizes were offered for the best general floral display, which formed an interesting one. Messrs. PERKINS, Coventry, 1st; Mr. J. ARNOLD, Stoke, 2nd; and Mr. J. TOMLINSON, Devonport, 3rd, making, with others, a capital show.

Groups of Chrysanthemums, confined to 100 square feet, with foliage plants intermixed, were arranged at the sides of the hall. In this competition, the prize-winners were Mr. J. WEBBER, Plymouth, 1st, with plants carrying good blooms, but not well arranged; and Mr. F. HODGES, Plymouth, 2nd, who had arranged an interesting and showy group of Orchids in front of the orchestra.

ISLE OF WIGHT.

NOVEMBER 5.—The monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport on the above date.

Dr. J. GROVES, J.P., presided over a large attendance, and a lecture on "Four Years' Experiments with and without Artificial Manures" was given by Mr. F. W. E. SHRIVELL, F.L.S., of Tonbridge, Kent. At the close, twenty members were elected.

The ISLE OF WIGHT CHRYSANTHEMUM SOCIETY held their 14th annual exhibition at Newport on November 2 and 3. Cut blooms were satisfactory, but the plants were not so good as usual.

The RYDE CHRYSANTHEMUM SHOW was held on November 1 and 2, when an average exhibition was arranged.

* * We are compelled to hold over reports of Birmingham, Liverpool, and other important Chrysanthemum Exhibitions until our next issue.

THE APIARY.

Queen Introduction.—Weak stocks are troublesome to preserve, and rarely do much the following season; two or more lots may therefore be joined together, as directed in former pages. Some swarmed stocks will probably be found queenless; these should be re-queened at once, or united to other swarms wanting bees. Such admirable appliances, in the shape of introducing-cages for use in re-queening, are now sent out with queens by reliable queen-rearers, that we need only advise that no old-fashioned contrivance or out-of-date method of introducing be tried; this point attended to, failure in queen-introduction should be almost a thing of the past. When making the final examination of stocks for the year, note the general condition of the hive and its contents for future use, especially keeping a watchful eye for any appearance of disease. If brood is seen, do not trouble much to find queens. Before quilting down, scrape the tops of the frames well, removing every irregularity in the shape of propolis or bits of comb. Give a good puff or two of smoke to drive the bees down, and pass a hand-brush rapidly over the tops of the bars; any scrapings which fall down can be cleared away when cleaning floor-boards. We would here urge a precaution: do not interchange floor-boards indiscriminately—we have known disease to be spread in this way through the operator being unaware of the presence of foul brood in his apiary. Destroy any quilts propolised and worn-out, and arrange top-coverings of frames neatly, using some means to keep them down at the sides; a good chaff-cushion laid on quilts makes a better cover than several layers of carpet only. *Expert.*

NOTICES TO CORRESPONDENTS.

APPLE: *Miss Phillips.* The twin-fruits of Mère de Ménage are not uncommon. Twin-fruits generally are the results of the fusion of two blooms at a very early stage of growth.

BAMBOO-TREE: *L.* If anything is entitled to be so called, it is the Banana (*Musa*). What you send is a leaf of *Polygonum cuspidatum*, a Japanese "knot-weed." The popular name you cite has the usual lack of appropriateness, seeing that the plant is neither a Bamboo nor a tree. The resemblance to a Bamboo is of the most superficial character.

ECHINOPSIS: *A. Cobbold.* The appearances are due to bruises from blows, &c. The plant is healthy.

FOREIGN NAMES: *F. C. V.* The rules of pronunciation in French, German, and Italian, the languages mostly used in giving the names to Chrysanthemums, do not admit of explanation in the space at our disposal.

CHRYSANTHEMUM BLOOM: *J. H.* The bloom has not been dyed. It is the variety Chas. Davis, a sport from Vivand Morel.

CHRYSANTHEMUM SPORT: *J. S., Lewisham.* Submit same to one of the trade growers, who will soon tell you if it be worth anything. Providing it is of distinct colour, any sport from Vivand Morel is valuable, the type being so good.

GOOSEBERRY AND CURRANT BUSHES: *E. G.* If tomites and bullfinches are not troublesome, you may prune the bushes at this season; otherwise leave the pruning till the buds begin to swell. Could not your gardener be sent to some good garden in your neighbourhood, say, Warwick Castle, Stoneleigh, or some market growers, and study the methods practised by the gardeners?

LAWN: *Perseverance.* We think that you fail to have a good lawn because of the porosity and poverty of the soil. You should clear away the old turf, or dig it in after dressing the ground with a good proportion of fresh loam, a sprinkling of quick-lime, and a few wheelbarrow-loads of stable-dung. Your land, or at any rate, the underlying stratum being gravelly, water passes very quickly, and with it much of the manurial agents in the soil; and a dressing of heavy loam will partially correct this. The grass sent is *Agrostis stolonifera*, a not naturally bad grass, but of little use by itself. Purchase the finest lawn grass-seeds from a good house, or the best turf obtainable. Turf may be laid at any time when there is no hard frost. Seeds may be sown now, the ground being warm and moist; or in April.

MICROSCOPE: *J. H. D.* We recommend you to get a good stand first of all, to this you can add luxuries afterwards. A good stand with a low eye-piece, and two object-glasses of 1 inch and $\frac{1}{2}$ inch, can be had for about 5 guineas, and will be enough for a beginning. You will not be able to make much progress by yourself, so that it will be best for you to attend some class, where you can obtain practical instruction in the way of using the instrument.

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. They entail an expenditure of time, labour, and money, of which our readers can have little idea. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.

—*C. J. W. Pears:* 1, Beurré Diel; 2, Bergamot d'Esperen; 3 and 4, Louise Bonne of Jersey.—*Morden.* 1, Queen Carolae; 2, Cellini.—*W. G., Sorley.* 1, Beurré Bos; 2, Marie Louise; 3, Baronne de Mells.—*Cecil Perceval.* 1, Duck's Bill; 2, King of the Pippins; 3, Margil; 4, Gooseberry (?); others not recognised.—*J. Reynolds.* 1, Fearn's Pippin; 2, Alfriston; 5, Duck's Bill of Sussex.—*Malvern.* 1, Royal Codlin; 3, Lord Derby; 4, Pitmaston Pine-apple; 5, Small's Admirable; 6, Urbanist.—*P. R. Apple,* New Hawthornden; Pear, much bruised, cannot be determined.—*J. B. Davies.* 1, Mère de Ménage; 2, Catshead.—*H. A.* 1, Hormead's Pearmain; 2, Scarlet Nonpareil; 3, Braddick's Nonpareil; 4, Cox's Pomona; 5, Mère de Ménage; 6, Catillac; 7, Duchess d'Angoulême.—*Beatrice, Hurst Place, Beesley.* 1, Scarlet Nonpareil; 2, Waltham Abbey Seedling; 1, Golden Reinette; 3, French Crab;

4, Nonsuch; 5, Galloway Pippin.—*Philomathus.* 1, small Vicar of Winkfield; 2, Beurré d'Anjou; 3, and 4, not recognised; 5, Beurré Clairgeau; 6, Scarlet Nonpareil.—*Cydonia.* 1, Cox's Pomona; 2, Braddick's Nonpareil; 3 and 5, not known; 4, King of the Pippins.—*Sylvanus Fox.* 1, Annie Elizabeth; 2, Blenheim Orange; 4, Tower of Glamis; 5, Royal Codlin; 6, Blenheim Orange.—*A. W. Apple Stürmer Pippin.*

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*A. M.* *Staphylea pinnata.*—*P. M. M., Dumbarton.* 1, *Oncidium O'Brienianum*, Rehb. f.; 2, *Catasetum fimbriatum*,—*C. E., Abergavenny.* 1, *Codiaeum Queen Victoria*; 2, *C. Mortii*; 3, *C. Evansianum*; 4, *C. angustifolium*; 5, *C. Johannis*; 6, *C. irregulare*; 7, *C. chrysophyllum*; 8, *C. variegatum*.—*W. M., Surrey.* *Catasetum cristatum*, *Botanical Register*, t. 966.—*Alpha.* If you are in a neighbourhood where fogs prevail at this season, it would account for some of the buds of your *Odontoglossums* turning yellow. Otherwise, it might be from something causing an unhealthy atmosphere in the house. Fresh paint will do it, or stagnant moisture.—*J. L.* 1, *Cupressus Lawsoniana*; 2, *Juniperus chinensis*; 3, *Cupressus Goveniana*; 4, dwarf form of common Spruce, *Picea excelsa*; 5, *Liquidambar styraciflua*; 6, *Pseudotsuga Douglasii*, the Douglas Fir.—*J. S.* Send them to a trade grower, who will compare them with those in his collection.—*J. P.* *Juglans nigra.*—*Ellen W.* *Gomphocarpus fruticosus*.—*W. B.* *Cupressus sempervirens*, the common Cypress Salvia.

NON-FRUITING OF VANILLA: *A. M.* The flowers of this species of Orchid have in this country to be fertilised by removing the rostellum by means of a pair of pointed forceps, which must be introduced sideways between the anther and the stigmatic surface, so as to pull it away in the direction of the latter. The pollen-masses are then drawn out, and pressed down on the latter, and the operation is complete. To enable you to better understand the operation, see our issue for October 30, 1897, p. 307, for figures.

PELARGONIUMS: *Novice.* If the shoots are much crowded, you might remove the weaker ones entirely; but the less mutilation at this season, the better. Keep them rather short of water at the root—that is, afford water only when the soil has got very dry. Pruning can be performed in March, or earlier if you put them in heat.

ROSE LEAVES DROPPING: *H. M. S.* No fungus can be found on Rose leaves. If the trouble occurs again, you might send fresh specimens.

VARIEGATED ELM: *J. S.* The shoots sent are taken from a form of *Ulmus campestris*, and may be a natural sport, therefore not a worked plant; but in any case a tree having a circumference of 5 feet would show little mark of having been budded or grafted if the stock and scion made equal growth, or the point of union was below the soil. The propagation of varieties is performed by shield grafting on seedlings of the common Elm in the month of July, and cleft grafting in March and April, close to the ground, or high up as standards. It is safer not to cut through the albumen, or remove the wood, if any should come away with the shield.

CONTINUED LARGE INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

MORE THAN DOUBLED,
and that it continues to increase weekly.
Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES of GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

(For Markets and Weather, see p. x.)

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 19, 1898.

THE PRINCIPLES AND PRACTICE OF BULB-GROWING.

AS the thoughts of the cultivator are now directed largely to the care and attention of that most interesting and important group of garden gems known as bulbous plants, it will be well to consider something of the principles underlying their life history. Perennial plants, exclusive of shrubs and trees, are able to persist and live on from year to year by means of an underground extension of their stem, which is thickened and swollen owing to its becoming converted into a storehouse of nutriment, manufactured and sent down chiefly by the leaves; the scales, or subterranean foliar appendages, or even the enlarged bases of the lowermost aerial leaves, may also take part in this function of a food-storehouse. From these perennial underground stems a continuous series of buds arises year by year, developing into the sub-aerial stems bearing the leaves and flowers. In most dicotyledonous plants these underground stems are generally structures more or less elongated either in a horizontal or vertical direction, and swollen as compared with the aerial stem; they are termed rhizomes or root-stocks. Such are also found amongst monocotyledons, as in the Iris, Solomon's Seal, Lily of the Valley, Black Bryony, Sedges, grasses, &c. In some plants the rhizome becomes very much swollen and characteristic in shape, as in the Potato, Jerusalem Artichoke, and Orchis; in many foreign Orchids the swollen portion of the stem, which serves as the storehouse of food, is aerial and green in colour, and known as a pseudo-bulb.

Coming now to those plants which are comprised in the gardeners' category of "bulbous plants," and which also possess this underground extension of the stem, there is the order Iridaceæ, which contains the three genera, Iris, Crocus, and Gladiolus. The underground stems of these plants are called corms, which in shape are rounded and bulb-like, but are not true bulbs, for they have a smooth exterior, and are devoid of scales, bearing foliar organs only at the apex when they sprout. Only certain species of Iris produce such corms, such as *I. reticulata*, in which that organ is covered with a beautiful fibrous network, and the Spanish Iris. In the order Liliaceæ is another corm-bearing plant, the Meadow Saffron, *Colchicum autumnale*.

It is a curious fact that the true bulbous plants belong exclusively to the monocotyledonous class, and principally to the order Liliaceæ. The "bulb" is a short extremely reduced underground stem, bearing great numbers of densely-packed foliar appendages, or scales, on its upper surface, and numbers of adventitious roots below. From the central part of its upper face arises, at the proper

season, the flower, or the aerial stem. In these plants it is the scale-like foliar organs, and not the stem itself, which are the store-houses of nutriment for the whole organism, and so thick and fleshy in texture have these scales necessarily, from their function, become, that they are scarcely recognisable as foliar organs; yet they are but the ordinary leaves of the plant, modified to subserve a special purpose in the economy of that plant's existence. Such bulbous plants are the Hyacinth, Tulip, Lily, Onion, Squill, Glory of the Snow, Star of Bethlehem, Snake's-head Fritillary, Crown Imperial, Daffodil, Snowdrop, Snowflake.

The bulb is a complete individual in itself, and so concentrated are the life-forces within it, owing to the great accumulation of compactly-stored food-substances in the tissues, that it may be removed from its natural environment and dried, just like a seed, without being in the least devitalised. For the power is ever latent within it of producing leaves, flowers, and roots whenever a favourable opportunity shall arise.

Having reached a certain age, the bulb may propagate itself by means of ordinary stem-branching, i.e., that in the axil of one or more of the foliar organs, or scales, a branch in the form of a swollen bud, may arise, developing fleshy appendages, or scales, like that of the main axis, until, eventually, it grows into a bulb like its parent, which latter decaying, it eventually replaces. Great numbers of such young bulbs may be produced by the parent; obviously a most convenient and rapid method of propagation.

In the cultivation of bulbs, the first consideration of all is the kind and quality of the soil they require. This must, naturally, primarily be determined by the character of the soil in the plant's own native habitat. For Tulips and Hyacinths it has been found that a light soil, more or less sandy in nature, is the most suitable, for the tissue of the bulb being so fleshy in character, and the scales so compactly arranged, there would be a tendency for these latter to rot if the soil were too moist and heavy. Hence we find most bulbous plants in Nature occurring in a light, porous soil. This soil, in cultivation, in order to improve on the quality of the flowers as they are produced in Nature, has, of course, to be considerably enriched by manure, cow-dung being that chiefly used, for otherwise there would not, in the soil itself, be sufficient nutriment forthcoming to enable the plant to build up the wonderful, richly-coloured, and richly-scented blooms we know so well, and the abundant and healthy foliage. The bulb farms of Holland and Lincolnshire afford as suitable spots for the cultivation of these plants as can be imagined, for the soil is light in texture, the land is perfectly flat, and owing to its low level, a uniform state of moisture prevails in the soil.

Narcissi require a rather stiffer soil, and less manure, the ammoniacal properties of which are deleterious to these plants. They also prefer more shade than Hyacinths and Tulips; our wild Daffodils are usually found growing in woods or on grass under trees.

The proper season for planting bulbs is that in which they are in a dormant condition, when growth of every kind has ceased, and the bulb is in a thoroughly ripe state, and ready to commence active growth anew, when favourable conditions again recur. But, as the season of flowering for the different kinds of bulbs varies, so must, to a certain extent, the time of planting. The very early-flowering kinds,

such as Snowdrops and Crocuses, must be put in the ground quite early in September at latest, and this for the reason that they may have ample time to establish themselves in the soil by emitting roots in good time for the next flowering period. For the later-flowering kinds, like Hyacinths and Tulips, there is a wider margin left for the proper establishment of the bulbs in the soil before the necessity for flowering supervenes. It is obvious that the soil where the bulbs are planted must be in a dry and porous condition, for if it be wet and sticky, rotting of the roots might ensue as fast as they are emitted, if not of the bulb itself.

The bulbs of Lilies require to be planted as soon after they are ripened as possible, as if stored too long out of the ground on the shelf, they dry up. The reason for this is found in the fact that they possess a structure different from that of other bulbs; instead of the tunicated character of the bulbs of the Hyacinth and Tulip, in which cuticularised coloured scales completely cover the inner fleshy ones, these latter in the bulbs of the Lily are quite exposed, so that there is here no modification in texture of the outermost scales for the benefit of the inner, and hence the bulb cannot so long withstand exposure to dry air.

The depth at which bulbs should be planted in the soil varies according to their size; the rule is to plant at about twice the depth of the bulb itself. If not planted deep enough, they will be subjected to the dangers of mice, wet, and frost, and the bloom will be injured. If planted too deep, they will be strained and exhausted in trying to reach the surface of the soil, and the bloom will be so much the weaker. Great care should be taken that the bulb be not left hanging half-way down the hole that has been made for its insertion in the soil, for in such case the roots, on being emitted, would tend to get dried up and die; neither should the soil below the bulb be pressed down in any way, as by pushing the bulb into the soil instead of preparing a hole for it, the roots might be prevented from or greatly delayed in penetrating. A good method of planting is that adopted by the Dutch, who remove the top layer of soil from the first bed, and carry it to the other end of the field; then, placing the bulbs in position at the corners of squares marked out with a rod, they are covered by the soil taken off the next succeeding bed, and so on through the entire field. In this way all the bulbs are securely planted at a uniform depth; whereas, by the method of making holes, there is always a likelihood that some bulbs will be inserted at greater depths than others. *W. C. Worsdell.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

EULOPHIA GUINEENSIS.

A STRONG plant of this rarely-seen Orchid is now bearing four spikes of flowers in the Orchid-house at Kew. It was received a few days ago from Mr. Johnson, Curator of the Accra Botanic Station, who placed it in a Wardian-case in flower, and it has continued to bloom during the voyage from the West Coast of Africa. The spikes are 2 feet high, and each bears about a dozen flowers. The pseudo-bulbs are clustered, conical, an inch long; the leaves a foot by 4 inches, and the flowers are about 2 inches across, with brownish sepals and petals, and a Miltonia-like lip, which is wavy, ovate, over an inch long, coloured lavender-purple, with streaks of a darker shade. This plant used to be grown well by the late Mr. Spyers at Burford Lodge, where, he said, it had always been a favourite, producing magnificent spikes of bloom, which lasted six or eight

weeks in perfection during August and September, under treatment similar to that usually given to *Phaius Wallichii*. It is worth importing in quantity. There is a poor figure of it in the *Bot. Mag.*, t. 2467; and a much better one in *The Garden*, xix., 332.

DENDROBIUM AQUEUM.

Whilst albino varieties of Orchids are sought after and treasured by the connoisseurs, a species which produces attractive pure white flowers, and is easily managed, has apparently few admirers. Such a plant is *Dendrobium aqueum*, which is common in the south of India, imports well, and, when grown along with *D. nobile*, flowers profusely in October and November. It has the general appearance of *D. nobile*, but the pseudo-bulbs are more succulent, and the flowers are produced in pairs or triplets from the axils of the green leaves; they are 2 inches across, milk-white, with a faint tinge of yellow on the crest of the labellum. There is a good figure of it in *Botanical Magazine*, t. 4640, and another in *Paxton's Flower Garden*, ii., 175, where it is called *D. album*. Good examples of it are now in flower in the Orchid-house at Kew. W. W.

THE ROSARY.

AUTUMN NOTES.

THE difficulty of saying what ought to be done in the Rose-garden in autumn, is in many years increased by the peculiar character of the season, and I do not remember any year when the difficulty has been greater (at least in certain parts of the kingdom) than this year. In this south-eastern portion it was till lately impossible that anything could be done in the way of planting owing to the extreme dryness of soil. A pathetic appeal was put forward by Mr. Bunyard of Maidstone, one of the largest fruit-tree growers in the kingdom, telling his customers how impossible it was that he could at that time execute any orders, and asking them to have patience with him, and not to do what must subsequently result in loss. Then, again, one of the largest Rose-growers in East Anglia said it is impossible to lift any plants until they have had forty-eight hours' good rain; while from others in the west, and where there has been abundance of rain, the opposite story is told. One grower writing to me says—"Our ground is so saturated with moisture, that it is impossible to do anything in lifting and thinning-out our plants! The extreme drought which we have experienced in the eastern parts of the kingdom has had one beneficial effect—it has thoroughly ripened and matured the wood, and there is not that very free growth at this time of the year, which although it may give us additional flowers, is in the judgment of most Rose-growers not conducive to the vigour of the plant, nor is it favourable to the formation of new plantations where these are required. It is impossible to trench the ground when in many cases the earth runs off the spade like sand; while in heavy ground, such as the Rose most delights in, digging is impossible.

So much has been written upon the subject of planting, it is hardly necessary to say much upon the routine of the necessary work; some points in connection with it, may be well to revert to. One notices that there are efforts made in cross-hybridisation to introduce new races of Roses. I confess that, in some respects, I am afraid of this movement. People may decry our fine exhibition Roses on which growers have for so many years expended their energies and lavished their affections, and yet I think it may fairly be questioned whether any amount of garden Roses would have helped forward the popularity of the flower as our exhibition Roses have done. We are a people of extremes, but I am convinced that if we transfer our affections and our exertions from the exhibition to the garden varieties that there will be a lamentable falling-off in Rose culture. These garden Roses are not for the owners of small gardens, and I think this fact is evidenced by the way in which the prizes for them are awarded; many of them are also only summer-flowering varieties, and although it is true that many of the H.P.'s do not always give us second flowers, yet there is always

a chance of their doing so. I would strongly urge, then, that in planting new beds, the old-established favourites be not left out in order to make way for the so-called garden varieties. Another feature in present-day Rose culture is the desire to group Roses of one variety together; this, no doubt, where there is space, forms a very pleasing feature in the garden, but there must be space if it is to be done effectually.

In the selection of Roses for this purpose, care ought to be taken that the Roses chosen should be those that are likely to give an autumnal bloom; of course, most of the Tea-scented Roses are of this character, and it is one of their great recommendations. Right up to the time when frost comes, a grower may depend on his Teas giving him some exquisite flowers, but they mostly lack colour, and therefore in many of the beds Roses of pink and red shades ought to be selected, such varieties as

grower must judge for him or herself what Roses they will discard from their beds. There are two things on which I should be inclined to lay great stress—one is, to avoid all known to be indifferent growers. I know that this will lead to the discarding of some most beautiful varieties, especially among the dark Roses. It may seem rather hard to put a ban upon such flowers as *Horace Vernet* and *Louis Van Houtte*; but what is the use of recommending them to a beginner? They will probably give some grand blooms for the first year, and then disappear or dwindle down into miserable plants. We have others of equally brilliant colouring which will grow, and continue doing so from year to year, and although an exhibitor cannot dispense with these varieties (for the former takes very often the Silver Medal for the best Rose in the show), yet to a non-exhibitor it will be a continual source of grief and disappointment.

FIG. 105.—POLYPODIUM GRANDE NIGRESCENS: A SUPPOSED HYBRID BETWEEN THE TWO FERNS FIGURED ON P. 363.

(For description see column c, p. 356, *Gardeners' Chronicle*, November 12.)

Mrs. John Laing, Mrs. Sharman Crawford, Captain Hayward, Gen. Jacqueminot, Gloire de Margottin, and others which growers may have found giving them autumnal blooms in their own locality, should be added. Mistakes may be made, as when a friend thought he was going to do great things, and made a large bed of *Maréchal Niel* on his lawn; he had not remembered that the flowers did not keep themselves erect, but hung down their heads, so that not a bloom was to be seen, and the bed disappeared in the following autumn.

Of course, when the work of planting in the autumn is considered, one most important feature is what alterations are to be made in the varieties to be discarded from or added to the collection. It is a somewhat curious fact that some Roses thrive better in some localities than others. I have known, for instance, that complaints have been made of some Roses as to their growth, which other rosarians have described as most vigorous; and therefore each

Another point on which I should be inclined very strongly to insist, is to do away with scentless Roses; what is called the *Victor Verdier* race contains many flowers of exquisite form and colour, but they are deficient in that one of the first requisites of a good Rose—delicious perfume. Dark Roses into whose constitution a strain of the old Damask has entered, and those light-coloured Roses which are derived in some way from the old *Centifolia* or *Cabbage Rose*, have both given rise to varieties of excellent perfume; but the progeny of *Victor Verdier* is scentless. They are, many of them, of pleasing shades of colour, and of perfect shape, and it may seem rather hard to exclude them, but I think that other varieties having the same recommendation, to which perfume is superadded, may be found in all our catalogues.

There is another class of Roses to which some of us object, on account of their size; one of the most recent of these is *Gustave Piganneau*. I know it is a very fine Rose, and has often won a medal; but I do

not care for it, any more than I do for Antoine Mouton or Paul Neyron. The latter has one quality which perhaps may lead to its retention in the garden, and that is, that it is a very persistent autumn bloomer, and is more especially in favour with foreigners on this account.

There is always a desire amongst Rose growers to know what novelties they should introduce in their gardens; this is sometimes a difficult matter to decide, the number of those announced does not diminish, but rather increases. For many years we have had a large number from France, sometimes about fifty or sixty, the merits of which we are obliged to take on the credit of their

of Cheshunt, have their fine large hybrid perpetual, the Rev. Alan Cheales: the colour is pure lake, and it is very free-flowering, and well adapted for massing; Dawn, a garden Rose of very vigorous habit, a seedling of Caroline Testout, crossed with a Bourbon; and Royal Scarlet, a single hybrid perpetual of a most brilliant colour.

Messrs. William Paul & Son's Empress Alexandra of Russia is one of the most brilliant coloured Tea Roses that we have, it combines many of the peculiar shades to be found in this section, and for those who admire dark Teas it will be indispensable. Enchantress is another very beautiful Tea, and will be much valued for its decorative character. Messrs.

RIVER-SIDE OSIER-BEDS.

HAVING recently visited an area on the Thames Bank given up to the cultivation of Osier coppice, I have sent these few notes for the guidance of any who may care to take up what is really a paying industry in a small way.

Area and Soil.—This area is $1\frac{1}{2}$ acre, and is rectangular in shape. The subsoil is London clay, covered with gravel, the upper soil being a fine sandy loam. No artificial manuring is required, as the ground is subject to frequent floodings, by which nourishment of various kinds is brought down—lime, potash, nitrogenous matter, &c.

Species.—There are two species of Osier here—

(1). *Salix viminalis* (common Osier). The leaves are elongated, the bark grey. This species does well for coarse wicker-work, and is the more prolific of the two.

(2). *Salix purpurea* (Spanish Osier).—The leaves somewhat resemble those of the Peach, and easily distinguish it from the common Osier. The bark is reddish-purple. This species is better adapted for fine wicker-work.

Dangers to which the Crop is Exposed.—Insects constitute the chief danger. A destructive leaf-roller—*Earias chlorana*—is found, which often eats into the centre of the leading shoots, and destroys the growth of the Willows.

Weeds are also a source of trouble; among these may be mentioned *Convolvulus major*, which has long underground rhizomes, and comes up year by year. This and the wild Hop are rather plentiful; both are close climbers, and twine themselves round the Osier stems, choking them to a considerable extent, and in many cases leaving a spiral wound along the course of their growth. Twitch-grass, Thistles, and Nettles, also grow rank, the latter often to a great height. However, if the area were weeded, say twice a year, there would be small chance of these intruders making much headway.

Method of Treatment.—The Osiers are all planted from slips, which must be well-grown shoots with full leaders, otherwise they would be dominated or suppressed before they could get a footing for themselves. In newly-formed beds smaller slips would suffice. Young roots come out from the lenticels. After two years, when they are 9 or 10 feet high, the stems are cut over at about 1 foot from the ground, the stumps left forming the "stools" for the coppice-shoots. The stools die after seven years, when they are dug out, and replaced by fresh ones. Thus, a seventh part of the area has to be planted every year.

Yield.—The slips are planted $2\frac{1}{2}$ feet by $2\frac{1}{2}$ feet apart, so that we get $\frac{48,560}{2\frac{1}{2} \times 2\frac{1}{2}} = 6969$ (say 7000) stools in an acre. If the stools give an average of ten wands apiece, we shall get 70,000 wands per acre. In France they are often grown much closer than this. These shoots or wands are tied up in bundles called "bolts." Each bolt contains about 100 wands, and is worth 2s. This gives us about £70 gross return per acre.

Remarks.—Of course, if the shoots are not cut over, they grow into standards. There are many such along the Thames banks, but they do not concern us here. This cultivating of Osier coppice is a good, sensible way of utilising what would otherwise be practically useless ground, and is certainly to be recommended. G. E. M.

TREES AND SHRUBS.

A NEW WITCH-HAZEL (*HAMAMELIS MOLLIS*, Oliver).

AMONG the numerous dried specimens of plants sent to Kew in recent years by Dr. A. Henry from Central China, was a new species of *Hamamelis*, collected by him in 1887, in the Hupeh province. This was named *H. mollis* by Professor Oliver, and was described and figured in the *Icones Plantarum*, t. 1742. From the first the species has been recog-

FIG. 106.—A, *POLYPODIUM NIGRESCENS* (SUPPOSED FEMALE); B, *POLYPODIUM VULGARE* VAR. *GRANDICEPS* (SUPPOSED MALE PARENT OF THE FERN FIGURED ON P. 362).

(For description see column c, p. 356, *Gardeners' Chronicle*, November 12.)

raisers or introducers; very little is known about them, and unless some English Rose grower has seen them, it would be unwise to recommend them. Beside these, we have an increasing number of home-raised flowers, of these we know more, as most of them have appeared at some one or other of our exhibitions—thus, from Messrs. Cooling & Son we have announced their beautiful Gold Medal Garden Rose, Purity, which is likely to be a general favourite. Messrs. Alex. Dickson & Sons have their fine Hybrid Tea Killarney, a beautiful Rose, with well-pointed bud, flesh-coloured, shaded with pink; Beryl, a Tea Rose of vigorous habit, yellow, with long bud, and highly perfumed; Mrs. Edward Mawley, another Gold Medal Rose, pink, shaded with fawn. Messrs. Paul & Son,

Frank Cant & Co.'s Mrs. Frank Cant is another remarkable flower: it is a beautiful clear pink, the edge and back of the petals silvery-white, large in size, and very vigorous in habit.

I have only enumerated some of the many candidates for favour, but I think these may be depended upon. I have said nothing with regard to those who are commencing to grow Roses, because there are so many lists put forth, so that it is not difficult to choose, but unquestionably the safest guide will be the list given in the National Rose Society's *Hints on Planting Roses*, for it combines the experience of a large number of Rose growers, both amateurs and professionals. *Wild Rose*. [This article was unavoidably delayed. ED.]

n'ed as a desirable one for cultivation, and now, fortunately, it proves to be in cultivation in the Coombe Wood Nursery. It has been there for some years, and the original plant is now a bush about 2½ feet high. This Witch-Hazel is very distinct, and can be distinguished at a glance from all the others by its leaves, which are not only the broadest and largest in the genus, but are also differently shaped, and covered beneath with a dense, felt-like mass of stellulate hairs. The upper surface is also slightly pubescent. The leaf is 4 to 5 inches long by 2½ to 3½ inches broad, the base being obliquely cordate, and the apex cuspidate. The margins, as in the other species, are sinuate and minutely toothed. I have not seen flowers on living plants, but the Herbarium specimens show them to be of much the same character as those of *H. arborea*. The petals are about ¾ inch long, thin, narrow, and wavy; according to the statement of the staff at Coombe Wood, the flowers are of a brighter shade of yellow than those of any other *Hamamelis*. Dr. Henry describes it as "a tree, 10 feet to 30 feet high."

During the last few years the Witch-Hazels have become very popular, more especially those from Japan. They are amongst the first shrubs that flower after the New Year, and the peculiar beauty and structure of their blossoms, as well as their perfect hardiness, give them a place among the very best of early-flowering shrubs. Such an addition to them as this new Chinese species, which also blooms in early spring, is, therefore, sure to be welcome.

The following species and varieties are now in cultivation, and all of them, even the old autumn-flowering American species, are worth growing:—*H. arborea*, *Masters*, Japan; *H. japonica*, *Siebold et Zuccarini*, Japan; *H. j. var. Zuccariniana*, Japan; *H. mollis*, *Oliver*, China; *H. virginica*, *Linn.*, East North America. *W. J. Bean*.

TAXUS ADPRESSA.

For small gardens especially, the above-named variety of Yew is very useful. One great advantage is, that it does not so soon outgrow its position as the common Yew. Its foliage is of a darker green than the last named one, and in general appearance it is very distinct in any shrubbery. There is a variegated form of it in commerce named *T. adpressa aurea*, which is constant in character, and in most soils is a good grower. Personally, I confess to a strong liking for Yews generally. They are of such an enduring nature. The periodical "zero" winter which mows down other evergreens, always leaves Yews unscathed. After the one we had in 1879, the only evergreen-shrubs uninjured here were Yews and Box. I am led to penning this note after admiring a fine specimen of the Yew in question growing in the grounds here. It covers a space about 7 yards in diameter each way; its height being about 8 feet. It has been planted about sixty years. Had it not been somewhat overshadowed by a group of forest trees, no doubt it would have been much larger. The semi-drooping branchlets so freely sprinkled on their under surfaces with bright coral-like berries, are, to say the least, very pretty. Those of your readers who have not already grown this Yew in their gardens, would not, I feel sure, regret adding one or more of it to their collection of evergreens. *H. J. C., Grimston Gardens, Talcaster.*

AMERICAN NOTES.

HELIANTHUS MAXIMILIANI.

This noble autumn-flowering plant is a native of the trans-Mississippi prairies, where, during September, one may see thousands of plants of it standing tall and stately among the Asters, golden rods and bunch grass. It was one of the weeds amongst which I grew up, and I have always had a special fancy for it. It has been a personal gratification to read the favourable notices of it in European journals of recent years, and to know that it is being cultivated and admired by the flower-lovers of foreign lands. Up to the present time it has been very little planted in the gardens of the Eastern States, and of course it is not planted in western gardens because it is so common

in the fields. One sees it now more and more frequently, however, and one and another plantsman is putting it in his catalogue. Some plants which I recently saw in a New York State-garden were a perfect glory with their long stems of golden-yellow flowers. It holds its blossoms very late in the autumn, and is desirable from many points of view.

SILPHIUM LACINIATUM.

This is another fine autumn-flowering Composite from the western plains. It is quite commonly known under the name of "Compass Plant," from the fact that, in the hot autumn days on the prairie, its large coarse leaves tend to take always a north and south direction. But aside from being known as a curiosity, it has not found its way into the hearts of American gardeners, nor into their gardens. I do not remember ever to have seen it mentioned in a nursery catalogue. Still, I regard it as a valuable ornamental plant; and I have no doubt at all but what it will some day be generally recognised and admired.

A "FREE-FLOWERING" CHRYSANTHEMUM.

I had the pleasure of seeing in the Cornell University greenhouses the other day some flowering plants of this novelty. I do not know in how much this is a departure from the habits and traditions of the Chrysanthemum, but it is something quite different from the ordinary florist's flower. The plants are small or of medium stature. The blossoms are of the Chinese type, and average about 2½ inches in diameter. They are nicely doubled, and appear to be of good substance. They are clear white. Of course, such small flowers as these will not take the place of those of 6, 8, or even 12 or 14 inches in diameter which are handled by the trade during the winter, but they are nevertheless much prettier than the overgrown florists' flowers for many purposes. They have good stems, and are suitable for cutting in sprays, or for use with short stems in design work. But the principal feature of interest is their habit of blooming the year round. Mr. W. T. Bell, the introducer, writes to the *Florists' Review* that one plant flowered September 26, 1896; that several blossoms were cut from the same plant the following Easter; and that from August to December following it was in almost continuous bloom. A plant of this sort will appeal strongly to many amateurs, and it will probably find favour for certain classes of work with professional florists. *P. A. Waugh.*

NOTES ON PEACHES AND NECTARINES.

THERE appears in the last issue of the *Journal of the Royal Horticultural Society* a report on Peaches and Nectarines as grown at Chiswick, in which fifty-eight varieties of Peaches and twenty-six Nectarines are described. The report, which was drawn up after careful examination in 1897-98, of the collections by competent authorities, cannot fail to be of much service to such planters of the above fruits as need a guide when ordering trees. I do not suppose that the list intended to be considered exhaustive ones of good varieties; at the same time they include most of the best. One grand Peach that deserves to be included in every collection, I notice is omitted, viz., *Raymaeker's*—or is it considered to be synonymous with another? It is also unnoticed by Mr. Wright in the *Fruit Growers' Guide*, nevertheless, there is an excellent kind grown under the above name. It was recommended to me by Mr. Coleman, of Eastnor Castle, who described it as a late Noblesse, a true character; but the tree is more robust, and the fruit larger than that of the old Noblesse. It should be mentioned, that my experience with it is confined to house culture, under which condition it fruits freely, and ripens a week later than *Barrington*.

As might be expected, *Bellegarde* is spoken very highly of. Taking everything into consideration, we have no variety to equal it, and it takes prominent places in each of our Peach-houses, succeeding equally well in an early, mid-season, late house, or outdoors. The tree is very hardy, blossoms freely,

rarely dropping any buds, and sets its fruits very freely. We have two trees of it in one house that respectively cover 220 square feet of trellis-work, and they never fail to carry full crops of fruit equally distributed over their surface. Were we confined to one Peach, we should certainly select *Bellegarde*.

Barrington, another old Peach, is truly alluded to as one of the finest and best late Peaches; like the preceding variety, it has a strong constitution. We have a tree of it growing in a second early house, where it has been for at least thirty-five years, and has, at any rate during the last twenty-five years, and probably previously, never failed to produce a good crop of large delicious fruit, although it sometimes drops many buds. During recent years the main branches of this old tree have been renewed by breaks from its base, there being but one of the original tree left. The best of the old Peaches, like the best old varieties of Grapes, appear hard to beat, at least with respect to flavour.

Dryden Nectarine is described being at Chiswick one of the best in every respect; and the same may be said of the variety here, with the exception of flavour, but in this important point it is like other white-fleshed varieties, inferior to the best of the yellow-fleshed ones, as, for instance, *Pine-apple*, *Pitmaston Orange*, and *Humboldt*. In regard to bud-casting in the Peach, the primary cause is a check to their development after they have been excited; this not unfrequently happens where bedding plants are occupants of a house during the tree's resting period—particularly is this the case after severe winters, where artificial heat has been employed to exclude frosts. *Thos. Coomber, The Hendre, Monmouth.*

RUELLIA MACRANTHA.

ON several occasions during the past few weeks specimens of flowers of this beautiful stove-plant have been sent to this office for a name, the possessors of the plants being in ignorance of its proper designation, although they were evidently acquainted with its cultivation. Its proper season of flowering are the months of October, November, and December, and on that account, apart from the beauty of the flowers, it is a plant the gardener should set much store by. The flowers, of a carmine-red colour, with white and pink lines on the throat, measure from 3 to 5 inches in length, and 2 to 3 inches in breadth, and these come in terminal axillary cymes on the main shoots. The leaves are retained by the plant for a considerable time, unless the soil is allowed to get very dry, when the lower parts of the plant become bare. Propagation should take place in the spring, in moderate warmth—say, 58° to 60° Fahr. The rooted cuttings should be potted in rich soil, and kept close and shaded till re-established. When the plants are well rooted afford air freely, and water in considerable quantity. The plants should have the points pinched out till they form bushes with from eight to ten shoots. The compactness of the growth depends more or less on the amount of air afforded the plants, and for the purpose of enlarging the flowers, and maintaining the plants in robust health without much repotting, manure-water should be afforded when the flower-buds commence to develop. The plant does best at the warmer part of a greenhouse or the cooler part of the intermediate-house. The flowers remain on the plant for fourteen days, and are produced for six to eight weeks in succession. Those plants that receive the fewest repottings, are naturally the first to come into flower; no plant should be repotted after the middle of August, and a month earlier is a better period to stop repotting. For an illustration, see p. 44 of *Gardeners' Chronicle*, January 12, 1895.

PALLANZA AND ISOLA BELLA.

(Concluded from p. 329.)

FROM Pallanza to Isola Bella is but a step, so to speak. This little island may be described as one of the wonders of the horticultural world; it is the property of the Borromeo family (who may let but who cannot sell

their islands on the Lago Maggiore). Count Vitalio Borromeo had it converted from a barren slate-rock into a beautiful garden in 1650-71. It is stated that every handful of soil on the island was originally brought from the mainland. The Isola Bella has not materially changed since Eustace wrote his *Classical Tour through Italy*, 1813. He then described it as follows:—"The garden occupies nearly the whole of the island. It consists of a pyramid formed of ten terraces, rising above each other, and terminating in a square platform. The terraces have gravel-walks the whole length; they are bordered with flowers, and their walls covered with fruit-trees. Rows of Orange and Citron-trees shade

some pleasing recollections in the mind of the English traveller. Gibbon described it as "an enchanted palace, a work of the fairies, in a lake accompanied with mountains." Other writers have expressed their opinions on the wonderful Isola Bella in somewhat different strains: Hazlitt, the critic, describing it as resembling "a pyramid of sweetmeats ornamented with green festoons and flowers;" and another comes to the conclusion that it "is only worthy of a rich man's misplaced extravagance, and the taste of a confectioner."

Both these worthies were obviously convinced of the extreme accuracy of their own individual standards of taste; but the Isola Bella

formed into terraces, against the walls of which are planted a great variety of kinds of the Citrus." The trees, Cadell in his *Journey in Carniola and Italy*, published eighty years ago, "are covered with houses of boards during six months of the year. The houses are put over the plants in the beginning of November, and now, on April 20, the gardeners are preparing to take them off. The front of the houses has wooden doors on hinges, that are opened in fine weather, to give light and air to the plants. In very cold weather, a fire of charcoal is made on the floor within the wooden house." However much opinions and tastes may differ, the glorious situation of this island, and the magnificent views to be had at every turn, must for ever remain engraved on the memory of every person who has once visited the place. *W. Roberts.*

THE CAMELLIA AS A SEA-SIDE PLANT.

WHAT a difference would our sea-side towns and villages present if we could only cover the walls and bare places with a variety of evergreens! What a relief if masses of green alike in summer and winter appeared for the eye to rest upon when it turns from the glare of the houses and the sea! The apparent difficulty is, that so few evergreens are found to flourish under ordinary cultivation in the soil and air of the sea-side. The *Euonymus* is an exception, as may be seen at Brighton and elsewhere; but there are, doubtless, others. We might imagine or reason out a list of names, but experiment would seem desirable before attempting the object on a large scale; and if after using the few tried plants more liberally we could add but one evergreen to the few already in favour, it would be a gain worthy of a reasonable expenditure of time, thought, and money.

Reasoning *a priori*, I would suggest that the first one experimented on should be the Camellia. It is as hardy as the *Euonymus*, a native of the same country, and practically the leaves, which are the breathing apparatus of the plant, are of a similar character, flat, smooth, and glossy, on which dust and other impurities cannot conveniently settle. If only the Camellia could be added to our sea-side plants, whether against buildings or as low trees, what a change would come over the spirit of the scene! There would be always the large, glossy, dark-green leaves, and in March, April, and May the large, handsome, red and white flowers. Turning the eye inwards from the sea, monotony would give place to variety, aridity to freshness, and a desert be converted into a fairy land. In making the experiment, the soil and choice of sorts and shelter present themselves to us as the most important points for consideration. It will not do to stick them in anyhow, as is too often done in planting, and then leave them to their fate. Holes 3 feet square and 2½ feet deep should be dug and filled with rich turfy peat or loam (not sea-side but inland soil), and then should be well drained, and yearly enriched by a top-dressing of well-pulverised manure. The plants should be firmly secured in their places, and watered occasionally as required. The sorts should be those known to the experienced cultivator as hardy, free-growing, and free-flowering, strictly avoiding those of an opposite nature, however beautiful, those which are over-double or of weakly growth being presumably the least desirable. Where the plants are exposed on all sides, it would be well, though not always necessary, to protect them from the wind on one side until the roots have taken a firm hold of the new soil; and they should not be planted singly, but in groups or masses. I am satisfied, after examining the few plants of Camellias that I have seen flourishing in sea-side towns in various districts, that the sea-air would be no obstacle to success, but a certain amount of shelter is absolutely indispensable. [In the warm south it is found that the Camellia, in single and double-flowered varieties, succeeds on a northern aspect better than on a sunny one, and the

FIG. 107.—A MONSTROUS BEGONIA.

(See Royal Horticultural Society, "Scientific Committee," in present issue, p. 372.)

the walks, and gigantic statues, which when near appear grotesque, crowd the corners and front of the palace. The parterres are watered by fountains that rise in different parts of the edifice, and fall in sheets from marble vases. The area of the pyramid covers a space of 400 feet square; the platform on its summit is 50 feet square, and its whole elevation is about 150 feet. The terraces are supported by arcades, which form so many grand galleries or green-houses, where the more tender plants and flowers are ranged during the winter. On the north side of this garden is a grove, which even modern taste must be gratified and delighted with; it is formed of various evergreens, but particularly Laurels, of great height and most luxuriant foliage. A path, winding in an easy curve through this thicket, leads to a grove, and thence to the palace. This grove, from its resemblance to domestic scenery, awakens

is one of the most perfect specimens extant of the Italian style of gardening, and it is ridiculous to compare it with the many styles which have at various times prevailed in England. Since Eustace wrote, a good many fresh plants from tropical and sub-tropical parts of the world have found their way to Isola Bella, and have become thoroughly acclimatised. But the general floral aspect of the place has not greatly altered—the Aloe, the Orange, the Myrtle, the Pomegranate, a great variety of Cacti, of Cypress, the Camphor, various species of *Metrosideros*, the Cedar, the Magnolia, Laurels, Cork-trees, Eucalyptus, Oleanders, Figs, Vines, Olives, Mulberries, and an infinite variety of other shrubs, trees, and herbaceous plants, here thrive with the greatest possible vigour. The Orange-trees at the Isola Bella occupy the south and east sides of the island, "which sides," as Loudon points out, "are

flowers, rather evanescent on out-of-door plants, remain on them for a rather longer space of time. There is, or was, a large plantation of Camellias on the Earl of Eldon's land at Lytchett, a place on the northern shore of Poole harbour. The plants grew without any attention whatever beyond cutting them back with a billhook when they got bare at the bottom. ED.] Wm. Paul, F.L.S., Waltham Cross.

A SUCCESSFUL HYBRIDISER.

AMONG the leaders in his profession stands the name of Luther Burbank, one of the most successful hybridisers of plants which this country has yet produced. He was born March 7, 1849, at Lancaster, Mass. His father was a farmer, and his mother a member of the Burpee family, a branch of which conducts at Philadelphia one of our largest seed-houses, survives at the age of eighty-five years. Young Burbank's education was considered liberal at his eighteenth year, and his first employment was in the Ames ploughworks at Worcester, Mass., of which his uncle was superintendent for half a century. But service in a noisy factory was not compatible with his love of Nature, and in 1870 he purchased a small tract of land at Lunenburg, Mass. Here began Mr. Burbank's career as a horticulturist, and his first work for the science was consummated in 1873, when he originated the Burbank Potato. Finding the climate of New England unsuited to the requirements of the experimental work in which he found absorbing interest, he removed, in 1875, to Santa Rosa, Cal., where to-day he has extensive grounds and a large collection of Lilies and many other plants, shrubs and trees.

Always an indefatigable worker, Mr. Burbank has run the whole gamut of horticultural experiment, and has many times duplicated his first success with the Potato. He grew more than a million seedlings to establish a new race of Gladiolus; and the Canna, Iris, Calla, and the Rose have also responded to the masterly touch of this adept hybridiser. Raspberries, Blackberries, Walnuts, Quinces, Prunes, and many other fruits have been developed to man's greater good at his garden of the Pacific. Beside his greenhouses and 10 acres of home grounds on Petaluma Avenue, Santa Rosa, he has a farm a few miles distant, at Sebastopol, where 18 acres are given over to seedlings, and 30 acres devoted to farm experiments. So fully is Mr. Burbank's time occupied by his studies, tests, and correspondence, and so seriously has he been annoyed by the depredations of those who seek personal profit as a result of his successes, that he refuses to admit the public to his gardens except in the month of June, which is reception period for intending purchasers. Then those who anticipate a view of uniform rows of beautiful plants, or healthy shrubs and vegetables, are sadly disappointed, for they find, instead, chaos, a veritable horticultural workshop.

A story which Mr. Burbank delights in telling is that of a member of one of the largest floral firms in the country who had travelled over 3000 miles to see the workings of this hive where man and nature join in industry. On the way from the station the visitor overtook an old gentleman who had worked many years for Mr. Burbank, and enquired of him if he knew Burbank. "Of course, I do," was the reply. "He used to have a big nursery, but sold it out, and now he raises acres and acres of stuff, and every summer has 'em all dug up and burned. I wouldn't give 150 dols. for the whole kerboodle." The gentleman from the Atlantic stored away this gratuitous advice, but before the day had passed he selected from Mr. Burbank's stock a half-dozen plants for which he paid 6000 dols.

Whenever humanity calls, Mr. Burbank stands ready to respond, and it may be said for his work that his best introductions are yet to come—at least, that is his opinion. It requires much time and close attention to properly segregate, classify, test, and propagate; and after having secured the desired improvement the work increases in value, and results in geometrical ratio as time progresses, one life affording only a good beginning for others to build upon. "The American Florist."

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Grape Vines.—The forcing of Vines, whose fruit is intended for consumption in May next should begin forthwith. If the Vines are grown in pots I would refer my readers to the Calendar for Oct. 29 last. Planted-out Vines which have been forced early in recent years may be depended on to break regularly for growth the entire length of the rods when secured to the trellis in the position in which they are intended to fruit, but in the case of Vines that were not forced early last season it is different, such Vines not breaking so regularly; and with the intent of making the break a satisfactory one, tie them temporarily along the lower part of the trellis, the uppermost end of the rods taking a downward curve, and in this position they must be kept till they have broken the entire length, from bottom to top, which is usually in about six weeks. Let the state of the inside border as to moisture be ascertained, and if it is found to be approaching dryness, a liberal application of tepid water should be made. In the case of an outside border not yet covered with a thick layer of dry leaves, this covering should be put on without further delay. Let the forcing go on slowly, beginning with temperatures of from 50° at night, 55° by day with fire-heat, with a rise of 10° to 15° with sun-heat, and in cold weather a warmth of a few degrees less will be better than hard firing. Let these temperatures rule till the buds on the Vines begin to burst, when the warmth day and night may be raised 2° or 3°. The rods should be wetted once or twice a day, and the floors damped, more or less, according to the brightness of the weather. Afford a small amount of ventilation by the upper lights to let out excess of moisture, closing early in the afternoon in mild weather, but affording a trifling amount of ventilation at 6 P.M., to remain through the night.

Other Vineries.—Prune, clean, and dress the Vines, and put generally in good order the vinery that will be started in January. We are having the usual foggy weather, which makes it incumbent for the successful keeping of late Grapes, to keep the vinery shut, and to afford a slight warmth in the heating apparatus. These precautions are as necessary in damp and rainy weather, as in time of fog. Look frequently and carefully round each bunch of Grapes for decaying and mouldy berries, removing them, stalk and all, with the scissors. Twice a week is not too often to do this. Let all kinds of work be forwarded, such as removal of the worn-out borders, taking out the whole of the soil and the drainage materials, but not disturbing the roots in the outer border. If the staple be retentive of moisture, the bottom should consist of concrete and the drainage of clean brickbats. The new material should be made into a border 3 to 4 feet wide, which is enough for one year. Outside borders may be renewed if the Vines are established in the inside borders made in recent years. If a border requires additions at the sides, do not add more than 2 feet.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor LAWRENCE, Bart., Burford, Dorset.

The Cool Odontoglossums.—Much attention will now be required of the grower of these plants, abundance of air being afforded them in mild weather, any neglect of which causing the new breaks, now rather forward, to grow weak, narrow, and lengthen unduly. Not only air is wanted, but plenty of light, to strengthen the flower-shoots. Water should be afforded with great caution, not a plant being allowed to get even moderately dry before having water afforded; on the other hand, a constantly wet state of the compost will cause decay, and the young leaves to go off at the points. At this season patches of mildew sometimes appear on the undersides of the leaves, which must be quickly eradicated, or they will spread with great rapidity to almost every kind of plant in the house. Let each plant be closely examined daily, and immediately mildew is detected, the hot-water-pipes should be made lukewarm, and a small amount of ventilation given at the top; and if the outer air is mild, the bottom ventilators should be opened widely. This kind of treatment will check the spread of mildew, but it will not destroy it entirely, and Richards' XL-All mildew insecticide should be employed on the affected leaves, using a bit of sponge. Full sunlight being essential, the glass must be kept bright by frequent washings. When re-arranging

the house, each plant should be freed from insect dust, and dirt. Slugs, generally numerous in the cool-house, which are always to be found in sphagnum moss, must be assiduously sought for, or the young flower-spikes will be destroyed in numbers. The gardener who is on night duty should be instructed to seek for slugs; and good baits for the latter consist of leaves of the Lettuce, shallow pans containing bran, slices of sweet Apples, and of Potatoes; and any of these may be placed on and among the plants. If, while engaged in re-arranging the plants, young growths, with a brown outer sheath noticed, slit these in several places, and then pull off in small pieces, so as to allow the roots to find their way without impediment into the potting materials.

Miltonias should now be growing freely, and these plants require similar attention. Occasionally when growing fast, some of the leaves of these plants clasp each other so firmly as to cripple the young leaves by causing crinkling. The gardener, when he observes this, should gently separate them from each other. A black spot which sometimes appears on the tips of the young leaves of *Miltonias* is due to growing the plants too warmly; and it affects to a large extent plants that are afforded water improperly, and especially such as are growing in constantly saturated materials, the evil being aggravated by a few degrees below the average temperature. During the winter months *M. vexillaria* and its varieties, *superba*, *Leopoldi*, *rubella*, and the beautiful hybrid, *M. Bleuana*, should be afforded a light, airy position in the intermediate-house, and protected from woodlice, which are partial to the new roots gnawing them and checking their development, so that it becomes a necessity to kill all that can be found. *M. Roezli* is a rather more difficult plant than *M. vexillaria*, but once a suitable position is found for it, it should remain there. The plants at Burford Lodge make free growth in the same house as *M. vexillaria*, but in the closer and warmer part of it. *M. Roezli*, unlike allied species, is a plant whose roots do not wander widely, and it may therefore be grown in small pots, and then, if well-rooted around the inside of the pot, a plant will take plenty of water at all times. The thin grassy leaves of this species, being rather tender, often get affected with black spot, and when this occurs, the plants should be kept a little drier in every way.

Cœlogyne cristata.—Those plants which have completed their growth for the season will be pushing up flower-spikes, the complete development of which takes a considerable period of time, and a constantly wet compost must be avoided, or the spikes will decay, after having first become black.

The Cattleya-house.—*Dendrobium Brymerianum* will now be in the middle of its growth; *D. Dearei* appears to thrive better in this house than when grown in the East Indian-house; and both species will require plenty of root-moisture, and on bright days a good syringing overhead will be an assistance, checking red-spider.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Jerusalem Artichokes.—Some roots should be lifted and stored in mould or damp sand for use in bad weather, when probably it would be difficult to get a spade into the soil; or the whole of the crop may be lifted, and pitted.

The Globe Artichoke.—These plants, if not already dressed, should be attended to forthwith, with plenty of rich manure, close up around each, heaping the more strawy parts round the shoots, with some soil strewn over all for tidiness' sake, and to prevent the wind removing it, sharp frost having a ruinous effect on unprotected shoots and roots.

Mushrooms.—Beds in the open air should now have extra protection, in the form of dry litter and oil cloth canvas covers, in order to preserve warmth in the beds. In the Mushroom-house maintain a steady warmth, not exceeding 60°, or falling below 55°, and do not make use of water on the beds unless the soil has become dry, but use the syringe daily in keeping the covering of the beds damp; and if the house has a tendency to get dry, even when fire-heat be now used, damp the floor and walls. New beds may be made as often as materials can be prepared. I prefer to make smallish beds at short intervals of time rather than large beds at long intervals.

Celery.—The later successional having made rapid growth of late, should now be earthed up without delay, taking care not to earth them up higher than the top of the heart leaves. Place protecting mate

rial in readiness for covering the rows of early Celery in the event of hard weather occurring—not before.

Spinach.—This crop is troublesome at this season to get in quantity; and all that can be done to encourage growth is to use the hoe freely between the rows on fine days, and to give a sprinkling of soot along the rows.

General Work.—Proceed with all kinds of ground-work, such as digging and trenching; also collect leaves for hot-beds, and keep the garden-walks clean and tidy.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Bush Fruits.—The pruning of the bushes may be now undertaken, so as to finish the operation before hard weather sets in. The bushes should be kept open in the centre, that is, freed of shoots generally, less so, however, in the case of Black Currants. A bush of Red or White Currants, after it is pruned, should resemble a basin, the main branches standing up at regular intervals all round, with here and there a shoot of this year's growth should be left on each, 6 to 12 inches long, the shorter shoots being the termination of the branches, all other shoots being spurred into a close cluster of buds at the base. Unduly long fruit-spurs should be removed entirely or shortened. Some varieties of the Gooseberry are naturally well adapted for the basin-form, the shoots tending outwards and drooping, others have a more rigid habit, and do not lend themselves so well to this form, and shoots may be left in small numbers, without being much shortened, to grow round about the central open space. The tips of the drooping varieties should not in any case be nearer to the ground than 1½ foot. The spurring-in of lateral shoots is the same as in Currants. In order to keep a bush that has reached, say, a diameter of 5 feet in the crown, the longer branches should be shortened back to a well-placed strong shoot, springing from their uppermost sides. Black Currants require to have much of the wood which has borne fruit removed at the ground-level, and its place left to be filled by the best of the current year's shoots. The shoots retained for bearing fruit the next year should not be curtailed in their length, excepting those that are unduly long in comparison with the others. In the case of young bushes, the shoots must all be cut back till a sufficient number break from the bottom to form a bush of, say, 2 feet in diameter, at which stage fruits usually form in some quantity, and cutting-back should then cease, and thinning-out take its place. When a Black Currant bush is exhausted, it may be rejuvenated by cutting every shoot down to the ground, when, if the land be heavily manured and forked over, strong growth will be made, and good crops of fruit obtained in the space of two years. Black Currant bushes with a single stem are sometimes planted, but it is a bad form, for the reason that not enough young shoots are produced yearly to make the bushes profitable. Strong shoots of the different kinds of bush-fruit should be secured at pruning-time for making cuttings, laying them in the soil thinly and firmly, if they be not made forthwith into cuttings. The earlier a cutting is made and bedded out, the sooner a callous is formed; and this is hastened in autumn by the warmth latent in the soil, whereas winter-made cuttings make no progress whatever before the sun has warmed the soil in the spring. Currants, red and white, and Gooseberry cuttings, should be 18 inches long, with a heel of old wood; and all the buds but four or five at the top should be scooped out. Black Currants should only have the terminal bud removed. Cuttings should be set out with the dibber or the spade in rows 1 foot apart, and the soil pressed firmly around them. When the pruning of the bushes is finished, the plantations should be manured if necessary, and the land dug with a fork as deeply as may be without injuring the roots, and the surface left in a rough condition.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord Gerard, Eastwell Park, Ashford, Kent.

The Rock Garden.—The present is the best time for renovating or replanting rockeries and alpine gardens. Usually the rains carry the soil away from the ledges and pockets, rendering it necessary that it be replaced with new compost. Leaf-mould and sand form a good compost for this purpose, and with this the work may be carried out, taking care to make it firm previous to planting. An enumeration of the plants which are suitable for the rock-garden would occupy too much space here, and it will suffice to name the

Saxifrages in their many varieties, Cyclamens, Arabis, and the Campanulas; these and many others, of which full descriptions may be found in the nurserymen's catalogues, will enable anyone to obtain the plants which are most suitable for this style of gardening.

Hardy Ferns.—Where shady corners exist in a garden, or there are places underneath large trees where grass will not thrive, hardy Ferns may always be planted, and the otherwise bare spots made interesting and pleasant objects to behold. If in such places a rockery be formed, and the Ferns planted on it so as to rise one above the other, the effect is better than when planting is carried out on level ground, as it admits of the beauty of individual Ferns being more clearly noted. Leaf-soft and fibrous loam, with some coarse sand or broken sandstone added, is all that the plants will require. The species which are suitable for planting in the shade are Polystichums, Polypodiums, Scolopendriums, Lastreas, Athyriums, and Osmunda regalis, the latter doing better if planted in wet places.

Cortaderia (Glycerium) argenteum (Pampas-grass).—There is scarcely any other hardy plant which throughout the autumn months affords a prettier effect in the garden than the Pampas-grass; whether it be planted in the front of shrubberies, on promontories falling into artificial pools, lakes, or the banks of streams, or on the turf, the effect is always good. The plant requires careful planting in rich, well-drained, deep soil, and then, when established, it grows large with great rapidity. A damp situation in which water does not stagnate suits it best. It may be remarked that a shallow soil resting on chalk does not suit the plant.

Bedding Pelargoniums in pots or boxes, should be frequently cleared of dead leaves, and afforded plenty of air in mild weather, but not much water at the root. In foggy or very damp weather, apply fire-heat by day, and afford air plentifully at the same time.

Canterbury Bells.—Plants raised from seed sown in June and July, should now be planted where they are intended to flower next summer, having previously afforded manure, and dug the ground deeply. Much care should be taken of the foliage, which is very tender when young, and readily injured. Do not plant deeper than the plant was before.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Richardias.—These plants should have made much progress, and some of them ought now to have spathes showing. If the pots are filled with roots, and are not large-sized, manure-water may be freely afforded, as the stronger the growth the finer the spathes. If the plants are growing in pits with movable lights, the latter may be removed entirely on fine days, plenty of air being necessary for sturdiness of growth. If green-fly is troublesome, as is often the case, fumigate the plants forthwith.

Chrysanthemums.—Conservatory and greenhouses will in many gardens be a blaze of colour at the present time, and this display may be kept up to the end of the year if late-flowering plants be kept in cool quarters, heat being used merely to keep frost out of the house. Slight shade of some description will also tend to retard flowering, removing the shading when the sun no longer shines on them. Plants that were lifted from the open ground, and are now rooting into the soil in which they were potted, may be assisted with manure-water. Now is the proper time to rectify mistakes in names. As the plants go out of bloom and are cut down, remove them to cold frames or pits, and afford protection in frosty weather; keep the soil rather dry till the new growth is well above ground. By removing the plants with blooms fully developed to a cool, dry shed, they may be kept in a fresh-looking state for a considerable length of time. Keep the houses as dry as possible, ventilate freely, and remove decaying leaves from the plants.

Centropogon Lucianus, Jacobinia (Sericographis), Giesbreghtiana, and Thyrsacanthus rutilans.—Afford these plants a position near the glass in order to prevent drawing, and afford weak manure occasionally. Too much water at the root will cause a sickly appearance in the plants, but an occasional application of sulphate of ammonia will improve the colour of the foliage. The quantity to be used in three gallons of water may be measured in the first instance by placing as much sulphate of ammonia on a shilling as can be piled up on it, and this quantity must not be exceeded or harm will result. Let the plants and the sides of the pots, and the stage between the pots be thoroughly syringed once a day.

FLORISTS' FLOWERS.

CHRYSANTHEMUMS.

No sooner have the blooms faded than it is time to make preparations for another season, and in doing this it is very essential that the foundation be thoroughly laid if success is to be looked for. The best results follow an early start, and steady progress throughout the year. Some gardeners would have us believe that the first week in March is early enough to take cuttings, but it is remarked that the advocates of this course are generally conspicuous by their absence at exhibitions, or generally make a poor show. Early propagation of the Chrysanthemum means a steady, uninterrupted growth in a cool temperature during the time the plants need glass protection, and under these conditions the shoots have the best chance of becoming properly matured. The wood of plants struck in the spring never ripens thoroughly, hence perfection, in incurved varieties at least, is seldom attained. It is not possible to get perfect examples of the Chinese or incurved section without a natural maturing of the growth of the plant; and this cannot be obtained by forcing them by leaps and bounds as it were, to make up for time lost. From the foregoing remarks my readers will gather that I am in favour of striking the cuttings early. Another objection, too, I have against late propagation is the amount of space required by the old plants which are to afford the cuttings, as against the little space required by the cuttings. Nor can the shoots be kept in such a good state for making cuttings as they are in December and January, being sure to get drawn and weak, and less well fitted to serve as cuttings.

Having decided that early propagation is advisable, the next thing is to take steps by the time many varieties are required, say, the middle of next month, to ensure good stout cuttings. Now that so many varieties and plants are grown in what is often a very limited space, it is generally necessary to stand the plants as closely together as possible during the season of flowering. The cuttings that are to provide the future plants must be obtained from the base of the plants that are still or have just passed out of flower; and owing to the absence of light among the plants, shoots are apt to be drawn, and consequently weak. Endeavours must be made to obviate this as far as possible, by affording each ample space, light, and air, and to enable this to be done, the plants that throw up plenty of shoots should be cut down to within a few inches of the soil; but shy-growing, new, or scarce varieties not lower than 1 foot from the soil, thus enabling some few more cuttings to be obtained from these.

These cuttings from the stems are not so good as those that spring from the roots, being apt to flower prematurely, and not too many such should be taken. By cutting down as soon as may be the plants that have bloomed, air and light are admitted to the plants, and the shoots get robust. Place the old plants in any cold house close to the glass, say, in a vinery or Peach-house, or failing these in a cold frame, which latter answers very well unless in time of hard frost; in that case considerable protection is required, or the tender growths will be injured. Some varieties throw up so many shoots that these become weak by overcrowding, and the weaker ones should be removed before damage is done. Not much water should be afforded, or the young growth will get unhealthy. Some varieties may refuse to start into growth, and it is often the weakly growers which have this fault. The drainage of the pots should be put in order, as a soured state of the soil is not favourable to the growth of the shoots. Let the surface-soil be removed down to the roots, replacing it with a fresh gritty compost. Syringe the plants daily, and in very stubborn cases plunge the pots in a gentle bottom-heat. Green and black-fly, which often infest the tips of the young shoots, must be got rid of by frequent fumigation with tobacco-paper, or by syringing with mild tobacco-water in which a little soft-soap is dissolved. It is surprising how soon growth is checked by an attack of aphids where a system is adopted of growing plants solely for the purpose of providing cuttings in May either by having stock plants in the borders, or growing them in pots and permitting these plants to produce one bloom each, no trouble should be experienced in obtaining the necessary number of cuttings when the time comes to strike them. It is, however, seldom that this can be effected, owing to lack of space or the time to attend to the plants during the summer.

E. Molyneux.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Nov. 21	National Chrysanthemum Society, Floral Committee meet.
TUESDAY,	Nov. 22	Royal Horticultural Society's Committee meet.
THURSDAY,	Nov. 24	Dundee Chrysanthemum Society's Exhibition (3 days).

SALES.

MONDAY,	Nov. 21	Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	Nov. 22	Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	Nov. 23	Dutch Bulbs and Continental Plants, at Protheroe & Morris' Rooms.
THURSDAY,	Nov. 24	Great Sale of Fruit Trees, at Perry Hill, Cliffe, near Rochester, by order of Mr. W. Horne, by Protheroe & Morris.
FRIDAY,	Nov. 25	Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—41° 6'.

ACTUAL TEMPERATURES:—

LONDON.—November 16 (6 P.M.): Max., 58°; Min., 53°.
PROVINCES.—November 16 (6 P.M.): Max., 55°, S. Coast;
Min., 45°, Aberdeen.
Dull, humid, foggy, warm.

Seaside Planting.

THE planter will be busy everywhere whilst the mild weather lasts, and seeing that many persons are in doubt as to which species of exotic shrub and tree will succeed at the seaside, we append a list of those about which there is no doubt. The plants mentioned are chiefly those of a deciduous character, and which may be safely planted at this season with, of course, due preparation of the soil.

The Camellia is deservedly mentioned as a good seaside shrub in the present issue, on p. 365, by Mr. W. PAUL; *Tamarix germanica*, every one knows, does well at the seaside. A fine broad spreading tree of not more than 25 to 30 feet in height is *Paulownia imperialis*, apt to get cut in the spring in inland places, but growing and flowering well at the seaside; the flowers looking, superficially, like those of the old purple *Gloxinia*, with pendulous flowers. *Colutea arborescens*, with yellow or copper-coloured flowers, and bladder-like seed-pods, a free-flowering and rapid-growing shrub, reaching to 12 feet in height, is excellent as a solitary plant, on the lawn or in the shrubbery. *Cornus alba* and *C. sanguinea*, the latter with scarlet rind on the one, two, and three-year-old shoots, are useful shrubs of rather loose habit in wet soil and half-wild places, and both stand cutting, like an Osier. *Cercis Siliquastrum*, or Judas-tree, is a perfectly safe leguminous plant for a seaside garden, flowering annually in such situations; the plant is sometimes mistaken for the pink *Laburnum*, *Cytisus Adami*. *Vitex Agnus-Castus*, a handsome bush, with semi-pendent stems, and light blue flowers—a

good object to stand on the lawn; the plant is kept in nice form if the stems, which are numerous produced, are cut down to the ground in March. All the species of *Berberis* and *Mahonia aquifolia* do well at the seaside, and are but little affected by wind. *Calycanthus floridus*, or the Carolina Allspice, should be planted in every seaside garden, if only for the sake of the delightful fragrance of its chocolate-coloured, filbert-shaped blossoms. Most of the *Eugenias*, the "Myrtle" of Australia, as well as the common large and small-leaved *Myrtles*, succeed in all parts of the south and south-west coasts; and even as far north as Berwick, the true *Myrtle* asks for but slight protection against cold. *Hydrangeas* of all kinds should not be omitted; but they should not be exposed to the worst winds. *Hippophae rhamnoides*, otherwise Sea Buckthorn, whose shoots are densely set with orange-scarlet berries in the autumn and winter, is a true seaside half-tree, partial to moist land, but growing in that which is only normally moist, and then making a more compact crown than in wet soil. The bush is dioecious, so that both male and female specimens are required. The sexes must be noted when in flower, for it is not possible to distinguish them by the leaves. *Escallonia*s are valuable as evergreens and for their flowers. *Philadelphus* (mock Orange) in their several single and double-flowered varieties, are valuable for their odorous, white flowers—and more especially *M. Lemoine*'s varieties, with dwarf compact growth and smaller flowers; valuable for making front rows in shrubberies, or filling large beds. The *Quinces*, with their big, saucer-like white flowers, and remarkable high-coloured fruits; also the *Medlars*, should not be forgotten. Both make capital lawn plants where rigid outlines in shrubs is not considered desirable; a sunny place is best for both. *Azara dentata*, *Benthamia* (*Cornus*) *fragifera*, the Tree-Strawberry, *Buddleia Colvillei*, *B. globosa*, *Caryopteris Mastacanthus*, any of the varieties of *Hibiscus syriacus*; *Paeonia Moutan*, if planted in partial shade; *Raphiolepis ovata*, all the handsome-leaved varieties of *Rhus*; also *R. Cotinus*, which has not attractive foliage, excepting in decay, but possesses singular-looking feathery flower-heads, hence its name, Wig-tree; the numerous variegated varieties of *Sambucus* (Elders), which, however, owing to the freedom with which they grow, the planter should be cautioned about using very largely, and thereby securing a landscape "rickled o'er" with yellow and white tints. This list of seaside plants is by no means exhausted, and we may at some no distant date revert to the subject.

CHRYSANthemum R. HOOPER PEARSON.—

The Japanese variety of *Chrysanthemum*, of which we present an illustration (fig. 103, p. 369), is a grand acquisition to the yellow-flowered group. It was a seedling raised by Mr. H. J. JONES, at the Ryecroft Nurseries in 1897, and was first exhibited before the Floral Committee of the National Chrysanthemum Society on October 31 last, when the novelty was unanimously awarded the society's First class Certificate. In build the flower most resembles the popular white flowering variety *Mutual Friend*, having the pleasing wavy characteristic of that flower. In size, the bloom photographed, was 1 to 2 inches larger than our illustration, and is therefore fully as large as most exhibition varieties. The chief quality of the flower, however, consists in its rich shade of glistening yellow, which pales all existing *Chrysanthemums* of that colour. In height the plant rarely exceeds 3½ feet when cultivated for exhibition-blooms. As a market or decorative bush-plant every bloom opens perfectly, and in this respect the novelty may

be compared to *W. H. Lincoln*. It has been found that for exhibition purposes the natural crown-bud in the case of this variety affords the best results. We believe the variety will not be distributed until next spring. It has been named in compliment to a member of our editorial staff.

ROYAL HORTICULTURAL SOCIETY.—The £10 10s. Sherwood Cup will, in 1899, be given for vegetables shown by amateurs or gentlemen's gardeners on June 13 and on September 26. The points obtained by each exhibitor on each day will be added together for the result. June 27 will be the Rose Show at the Drill Hall. On July 11 there will be an International Conference held at Chiswick on Hybridisation and Cross-breeding in Plants, together with an exhibition of hybrid and cross-bred plants with their parents (when possible) for comparison.—The next Fruit and Floral meeting will be held on Tuesday, November 22, in the Drill Hall, James Street, Westminster, 1 to 4 P.M. A lecture on "Artificial Garden Manures" will be given by Mr. A. D. HALL at 3 o'clock.

The following are the dates of the committee meetings in 1899:—January 10 and 31, February 14 and 28, March 14 and 28, April 18, May 2, 16, and 30; June (Temple Show, 1 and 2), 13 and 27; July 11 and 25, August 15 and 29; September 12 and 26; Crystal Palace Fruit Show, Sept. 28, 29, and 30; October 10 and 24, November 7 and 21, December 5 and 19; 1900, January 9 and 23.

HORTICULTURAL CLUB.—The monthly dinner and *conversazione* took place at the rooms of the Club, Hotel Windsor, Victoria Street, Westminster, on Tuesday evening, November 8, the chair being occupied by Sir JOHN D. T. LLEWELYN, Bart., M.P., chairman of the Club. The attendance of members was large, including Revs. W. Wilks and Joseph H. Pemberton; Messrs. H. J. Veitch, vice-chairman; E. Mawley, C. E. Pearson, James H. Veitch, W. Bassett, M. J. Garcia, T. W. Girdlestone, G. Bunyard, W. F. Cooling, R. Giffon Salmond, Selfe Leonard, Harry Turner, and the Secretary. The discussion was opened by Mr. T. W. Girdlestone, on "The Dahlia as a Garden Flower." He reviewed the various sections, and showed how much the Cactus Dahlia had increased in popularity, and that we might look forward to still further improvements in it. In the discussion which followed, in which most of those present took part, many interesting facts in connection with the flower were brought out, and a hearty vote of thanks was proposed by the chairman to Mr. Girdlestone for his interesting address.

DUNDEE CHRYSANTHEMUM SOCIETY.—We learn from a schedule sent us that the annual carnival of this society will take place on Nov. 24, 25, and 26, in the Drill Hall, Dundee. Last year's carnival, it is said, was the turning point in the society's career, it being on a scale much larger than formerly, and equal to the best shows in the country. This position the society has full confidence in maintaining, and this year the entries are expected to greatly exceed last year's. The society has been enabled to secure the band of the Scots Greys for Thursday and Friday the 24th and 25th, and that of the Grenadier Guards for Saturday, the 26th.

EXETER AND DISTRICT GARDENERS' ASSOCIATION.—At the fortnightly meeting of the Exeter and District Gardeners' Association, held at the Guildhall, Exeter, on the evening of Wednesday, 9th inst., Mr. F. EDWARDS, gardener at Honeylands, read an interesting paper, entitled "Deciduous Trees." Mr. W. ANDREWS (foreman gardener to the City Council) occupied the chair.

A GARDEN APPOINTMENT.—Mr. O. T. HEMSLEY, son of Mr. W. BOTTING HEMSLEY, F.R.S., of the Royal Botanic Gardens, Kew, has been appointed to the Indian Botanical Service, and arrived in Calcutta by the P. & O. steamer *Malla*, which had a rough time in the recent cyclone in the Bay of Bengal. Mr. HEMSLEY was to have been attached to the Royal Botanic Gardens, Calcutta, as an apprentice, but on arrival here was informed that he would be required to proceed to the Cinchona Plantation at Mungpu.

FIG. 108.—CHRYSANthemum R. HOOPER PEARSON: COLOUR RICH ORANGE-YELLOW. (S.E. P. 368.)

GRAMMATOPHYLLUM SPECIOSUM.—Mr. MACMILLAN, the Curator of the Royal Botanic Gardens, Peradeniya, writes in the following terms to the *Tropical Agriculturist*:—

"It may interest some of your readers to know that the largest Orchid known (*Grammatophyllum speciosum*) may now be seen in flower in those gardens, this being, so far as is known, the first time it has been induced to bloom in Ceylon. That this Malayan plant, which was introduced into Ceylon probably about 1850, merits the title of 'Queen of Orchids' will be conceded from the dimensions of the Peradeniya specimen above referred to, viz.: length of stems or pseudo-bulbs (twenty-four in number), 5 to 10 feet, the sheathing leaves being about 2 feet long, and closely arranged in two rows on the stem; height of flowering scapes (six) at present, 5 to 6 feet; thus the height from base of mound containing the plant to top of inflorescence is about 10 feet; circumference of the plant, approximately, 40 feet. Of individual flowers, nearly 500 can now be counted (not including the smaller in bud), each measuring $5\frac{1}{2}$ inches to 6 inches across."

PRESENTATION.—On Saturday evening, the 5th inst., a few of the *employés* as representing the other servants and friends on the Dupplin estate, called on Mr. BROWNING, the overseer, Dupplin Castle, at his residence, and presented him with a silver-mounted walking-stick and a purse of sovereigns, on the occasion of his leaving Dupplin. Mr. HENRY CLARKE, who presided, said he had a very pleasant, and at the same time an unpleasant, duty to perform. They very much regretted that Mr. BROWNING was about to leave them. He had been so long there—some twenty-nine years, that they had begun to look up on him as part of Dupplin, and his kindness to every one of the *employés* had been so marked, that they felt they were parting from one of their dearest friends. He had given many of the men very good starts in life, and they would all have very tender recollections of the time they spent in the gardens at Dupplin under him. Mr. BROWNING, in suitable terms, thanked the deputation for their handsome gifts.

MERYTA SINCLAIRI (the Puka tree).—In reference to the very interesting letter of Mr. BOSCAWEN'S in our last issue, we may now cite the following passage from KIRK'S *Forest Flora of New Zealand*:—"This noble species is one of the rarest plants in the world, being restricted to a few individuals growing on one or two small islands near the northern extremity of the colony; its leaves are larger than those of any other plant with entire leaves in the New Zealand flora. It does not occur on any part of the mainland. In 1869 Professor HUTTON and myself visited the Taranga Islands, where we had the good fortune to find a few trees which had long been known to the Maoris, when a description was published in the *Transactions of the New Zealand Institute*.* The plants found at that visit were confined to old Paleozoic rocks on one of the small islands of the group. Mr. ROBERT MAIR has recently discovered a few plants on another island; and Mr. T. F. CHEESEMAN has found a single plant on the largest island, which is entirely volcanic. The plant forms a small tree from 12 feet to 25 feet high, with stout branches; it is charged with a peculiar resin in all its parts, and the bark is easily wounded, producing large callosities as it heals. The leaves are alternate, crowded near the extremities of the branches, and carried on long leaf-stalks, which vary from 4 inches to 14 inches in length, the blades being from 9 inches to 20 inches long, many of the leaves were 30 inches long, including the leaf-stalk, and from 4 inches to 10 inches broad, equally rounded at both ends, or slightly contracted below the middle, with the margins slightly wavy, and strengthened by a remarkably stout marginal nerve. They are of a thick texture and bright-green colour. The male and female flowers are developed on separate trees, and are arranged in panicles from 8 inches to 16 inches long at the extremities of the branches. *Meryta Sinclairi* is of great value as an ornamental tree, and is easily cultivated in Auckland, Taranaki, and Hawke's Bay, but is unable to resist the light frosts experienced at Wellington. It is easily propagated from seeds, and, under cultivation, makes a handsome symmetrical

tree, very different in habit from the somewhat naked irregularly-branched trees on the Taranga Islands. The finest cultivated specimen is one raised by Mr. Justice GILLIES from a cutting brought from the Taranga Islands in 1869. Its present height is 25 feet, the trunk is 4 feet 8 inches in circumference, and the spread of its branches 28 feet. *Meryta Sinclairi* is only known with certainty to be found on two or three islands of the Taranga group, opposite the entrance of Whangarei Harbour, in the province of Auckland district. It is reported to grow on the Poor Knights, further to the north, and may possibly occur on one of the Three Kings Islands, about thirty miles from the North Cape." A specimen of the tree, 3 feet in height, is now in the Temperate House at Kew.

MONOGRAPHS OF AFRICAN FAMILIES AND GENERA.—Professor ENGLER has issued, through ENGELMANN of Leipzig, a monograph of the African Moraceæ, exclusive of Figs. It is a quarto of forty-nine pages, with numerous illustrations in the text, and eighteen lithographic plates. *Dorstenia gigas* is a curious species, about 7 feet in height, and with its stem dilated into a broad, flask-like form, and dividing into many branches at the apex.

"AMERICAN GARDENING" is now published as an independent horticultural periodical by JAMES W. WITHERS, 136, Liberty Street, New York. Mr. LEONARD BARRON continues as Editor.

HYACINTHS AND ONIONS ON THE STOCK EXCHANGE.—Intense enjoyment is derived by the miscellaneous mining market from its new Hyacinth game. About a week ago two of its members entered into a competition as to which would grow the best Hyacinths. The bulbs were duly bought, but the matter getting noised abroad, those of one competitor were abstracted, and Onions substituted. The bulbs were taken home to be planted, but the household of the victim discovered the plant, and the event has now been embodied in a song by the market poet. To the tune of *Poor Cock Robin* the elegant stanzas are poured forth with immense effect, and when a dark-green Hyacinth glass was introduced into the market for paper-ball practice, the enthusiasm knew no bounds. *Westminster Gazette*.

"AN OLD ENGLISH GARDEN."—This account of an Essex garden, by the Countess of WARWICK, will be illustrated by numerous fine photogravure illustrations of Lady WARWICK'S garden, near Easton, Essex. Three hundred and fifty copies only will be printed, and the book will be ready in the course of November. BERNARD QUARITCH, 15, Piccadilly, London, W., is the publisher.

PROTECTION OF FRUIT AGAINST PARASITIC FUNGI.—Herr A. TSCHOKKE describes the mode in which cultivated fruits—especially species of *Pyrus*, *Malus*, *Sorbus*, *Cydonia*, and *Mespilus*—are protected against the attacks of parasitic fungi, among which the most destructive are *Monilia fructigena*, *Botrytis cinerea*, *Penicillium glaucum*, *P. olivaceum*, *Mucor pyriformis*, and *M. stolonifer*. None of these fungi can penetrate the uninjured cuticle. By the growth of the fruits the stomates by which they enter become very sparsely distributed, and largely converted into lenticels. There is frequently a general or local formation of cork-layers, as in the Russet Apple. But since it is very rarely that the epiderm is not locally injured, the chief protection against fungi is the chemical nature of the fruit itself, especially the presence of tannic and malic acids in the peripheral layers of cells. *Landwirthsch. Jahrb. der Schweiz.*, vol. xi., p. 153.

"RIVIERA NATURE NOTES." By C. C. A popular account of the more striking plants and animals of the Riviera and the Maritime Alps. (Post 8vo, with numerous illustrations, especially of the garden at La Mortola, annotated by Commendatore Hanbury, to whom the work is dedicated; cloth, 7s. 6d.; 1898.) "These natural history notes have been collected during a long residence on the Riviera. As many as twelve summers were spent in the villages of the

Maritime Alps; so that the mountain and the alpine regions are as familiar to the writer as the sheltered coast which he has known since the year 1859. As the usefulness of a book of this sort depends in great measure on the index, it has been made very complete. Dr. ALLEN STURGE has been good enough to contribute an article on the 'Prehistoric Men of the District,' a subject on which he is an authority." *Extracts from Preface.*

LORD BROUGHAM'S BOOK ON THE ROSE.—The Prince of WALES has accepted the dedication of the very elaborate and beautiful book on Roses, written by Lord BROUGHAM, who is the owner of a charming garden on the Riviera, while the rosary at Brougham has long been famed.

HONOUR TO A SCOTTISH GARDENER.—A well-merited honour has just been conferred upon Mr. WILLIAM FOWLER, who has been widely known among horticulturists in the border counties of Scotland for more than a generation, as the able gardener at Mertoun, the beautiful seat of Lord POLWARTH, on the banks of the Tweed, in Berwickshire. About forty years ago, the present Earl of HADDINGTON, then Lord BINNING, taking a kindly interest in the welfare of the residents on the family estate of Mellerstain, where he resided, in the neighbourhood of Mertoun, started among other things designed to improve their social life and comforts, a flower show, at which Mr. FOWLER has acted as a judge for thirty-seven consecutive years—a record that has rarely, if ever, been exceeded in the annals of horticultural shows. From the beginning to the present time, Lord HADDINGTON has taken a personal interest in these shows, making a point of being present at the annual event, superintending the arrangements, and at the close paying the prizes to the winners, and giving all a kindly word of encouragement. To mark his personal esteem, and his high appreciation of Mr. FOWLER'S services as a Judge at Mellerstain Flower Show, Lord HADDINGTON has presented him with a valuable gold watch, in recognition of his faithfully discharged duties for the long period of thirty-seven consecutive years. May both giver and receiver be long spared to carry on the good work, and furnish examples worthy of imitation on every estate in the country.

ALLOTMENTS FOR HILLINGDON.—At the last meeting of the Hillingdon (Middlesex) Parish Council, it is reported that arrangements had been finally concluded with Lord HILLINGDON, by which His Lordship would lease to the Council for twenty-one years, five acres of land in Hillingdon for the purpose of allotments. His Lordship required that no pigsties, toolhouses, or buildings, should be erected on any plot except with his sanction, but beyond this he has made no restrictions. He at first required that the minimum size of the plots should be ten poles, but subsequently gave way on this point, and the Council are free to allot the land as they like. In view of the cost, the charges to allotment-holders will work out probably at the rate of 43s. 9d. per acre. The Local Government Board have been asked to sanction what has been done, and also bye-laws for the management of the land.

NOTICES OF BOOKS.

L'ART DU FLEURISTE AND LA MOSAÏCULTURE. (Librairie Horticole du Jardin, 167, Boulevard St. Germaine, Paris.)

THESE two handbooks, by M. Albert Maumené, may be mentioned together. The former begins with a chapter devoted to the use of floral decorations in past times, and then passes on to the subject of present-day supply of and demand for flowers. M. Maumené next gives descriptions of various decorative arrangements for indoor and for outdoor use. Chapters on mounting and arranging flowers should prove of practical value to many florists, those of our own country included, as here we too often see the finest blossoms grouped in a heavy inartistic manner.

* *Trans. N. Z. Inst.*, vol. ii., p. 101.

The Handbook on carpet-bedding opens with a history of the practice, following which we find many elaborate designs, lists of the best plants for "mosaïques," with instructions as to growing and regulating them at the different seasons of the year.

We should add, that both these volumes are fully illustrated, and we hope soon to see a translation adapted to our own requirements. That there is room for such a book is shown by the frequent enquiries we receive on the subject.

TWO BOOKS ON TIMBER MEASUREMENT.

MR. E. A. P. BURT has compiled two volumes, which are likely to prove of great practical value. Round Timber Measurement, Weight Tables for Railway Rates, and Guide to Round Timber Cubing Rule, Bark and Railway Measurement Weight Calculator, include tables which show at a glance results

Some of the attacks mentioned have long been known, but there are few, if any, of these concerning which we have not gained some additional information during the past few years, and of many of the others we have only lately become possessed of the whole life-history; whilst others again have lately shown themselves as perfect scourges (in our present large scale of fruit growing), which even within the last four or five years were wholly unknown to us as fruit pests. Among these may be mentioned the attacks of the flat shot-borer beetles in Plum trees; those of the "ground beetles" in Strawberry fruit; or again, of the eel-worm, which causes distorted growth of the Strawberry-plant.

In addition to the accounts of damage by insect attacks, observations are also given of a few other kinds of infestations, such as injuries by Phytophthoræ, or gall-mites, and nematoid worms; and also, and very especially, the infestation known as rust or

fruit is excellent for kitchen use at mid-winter, and the tree fruits regularly, but it is generally every third year that the crop is a full one. The soil is a stiff loam overlying limestone. Those of your readers who can find space for a tree or two of this Apple would not regret planting it. The fruits sent are fair samples (fig. 109). H. J. C., Grimston, Tadcaster.

HOME CORRESPONDENCE.

CHRYSANTHEMUM-RUST.—"It is my opinion," said a famous grower to me the other day, "that the 'Mums' have reached their limit, and the rust has come to keep them down." Well, what in the future may bring it is vain to prophesy; but seeing that some plants have the fungus disease badly, growers have grounds for apprehension. That it should have appeared in so many widely-separated places almost simultaneously is a remarkable fact, and now that it is at home with us, what measures will have to be used in defending the plants from attack? Cultivators are not of one mind as to remedies, and we can scarcely hope to stamp it out altogether. Further trials of antidotes must take place ere it can be said with certainty that such and such a remedy is effectual. It is to be hoped that no affected plants will be used for propagating purposes till every leaf is removed, and new shoots appear, after at least a month or six weeks' sojourn of the plants in cold frames. W. S.

COCCUS ON BEECH TREES.—Possibly there may be a confusion of terms. At any rate, the insect described by Mr. Divers (p. 354) which produces the cottony secretion on the fronds, is no "aphis," but a "coccus," known as *Pseudococcus fagi*. It is interesting to know that the carbolic emulsion used in this instance saved the tree. As a rule, this pest is one of the worst of all to eradicate, and I have been accustomed to look upon a tree once badly affected as doomed within a few years. Mr. Levett is perhaps alluding to some other insect when he says it hibernates under the soil on the top of the roots. It may be that both your correspondents are influenced by the secretion, which resembles that of the American blight, which is an "aphis." R. McLachlan.

THE AMERICAN BLIGHT: AN HEROIC REMEDY.—An American writer has stated, that in winter petroleum may be brushed into the rough old bark of the tree and set fire to without damage to the tree itself. This, of course, destroys the eggs, which washes and emulsions often fail to do. Someone here may be bold enough to repeat the experiment, but he will probably choose some subject the loss of which would be of little importance. The Beech-coccus might be experimented on in a similar manner. R. McLachlan.

NARCISSUS VIRIDIFLORUS.—I am much interested in reading Mr. C. Wolley Dod's reference to this as a difficult plant to keep. I have had my present stock for twelve years, and although the bulbs are now fewer than they have been, it is not unlikely that they will increase in numbers with a little attention. Among other out-of-the-way species, I have had *N. pachybolbus* for fourteen years, and *N. dubius* for eight. *N. Broussoneti* I happen to have lost, but it is a plant I usually have. R. I. L., Bot. Gard., Cambridge.

YOUNG GARDENERS AND THE R.H.S. EXAMINATIONS.—I notice one of your correspondents, "A. D.," writing in the *Gardeners' Chronicle*, p. 354, in respect to the disadvantages of young gardeners entering the above examinations. I quite agree with him that young gardeners are very much handicapped when placed by students from colleges and laboratories. But according to "A. D.," the young gardener he mentions is better off than some, having the advantage of attending lectures, therefore he should not be discouraged. I and two more gardeners who entered the last examination (not even having had the advantage of attending lectures), received Second-class Certificates. Our practice was to meet for a few hours' quiet study each week during the winter, with the above result. So we have the satisfaction of knowing that we scored off our own bats. B. G. S., Vale Garden, Northwich.

LEONOTIS LEONURUS.—Besides the method mentioned in the *Gardeners' Chronicle*, p. 350, another useful way of treating this plant is by giving cultiva-

FIG. 109.—APPLE LEWIS' INCOMPARABLE
(Reproduced from a specimen sent by Mr. Clayton.)

which otherwise could only be arrived at after considerable calculation. These books, therefore, are likely to save both time and trouble, and should meet with consequent appreciation. (Ryder & Co.)

INSECTS INJURIOUS TO ORCHARD AND BUSH FRUITS.

THE fruit growers of this country owe a debt of gratitude to Miss E. A. Ormerod for a very important work she has just issued, comprising 280 pages, on *Insects Injurious to Orchard and Bush Fruits, with Means of Prevention and Remedy*.*

In the preface the author says she has endeavoured to collect into a convenient form for reference the most important points of information which we possess regarding the life-histories and habits of the insects of which the attacks are commonly injurious to a serious extent to hardy fruits in this country, together with notes of methods of prevention, and remedy which have been found serviceable at a paying rate.

* London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd. Price 3s. 6d.

red-spider, of which more information was much needed where it would be easily attainable for general reference.

So far as our experience shows, the protection of our fruit crops from insect ravages is likely to be an increasing difficulty, consequent on the increasing extent of the areas in which one kind of orchard-tree or fruit-bush is grown year after year, thus giving every opportunity for the established settlement of the insect-feeders on that special crop.

We confidently recommend this handbook to our readers, which, it is hoped, may help, in some degree, to preserve a fair amount of our fruit crops from insect depredations, and give a fair return to the growers for their great outlay.

LEWIS' INCOMPARABLE APPLE.

I HARVESTED this year the crop of the above variety from a large tree growing at Grimston, which amounted to about 30 stones in weight. The tree is fully 100 years old, and of large size, and has a stem of 5 feet in girth at 3 feet from the ground. The

tion somewhat similar to that followed with the *Chrysanthemum*, with the exception that the plants should have a little warmth during the earlier stages of growth. By retaining and cutting back one or two plants after flowering, a plentiful supply of cuttings may be obtained in the spring. After these are rooted they should be grown on in an intermediate temperature for a time, but as the season advances transference to a cold pit is advisable. During the earlier stages, as growth proceeds, if the points of the shoots are pinched out twice it will conduce to a more bushy habit of growth. Pot on into larger pots as required until a diameter of about 8 inches is reached, a suitable size in which to flower the plants. From June to the end of August the plants should stand out of doors. Given this kind of treatment, *Leonotis leonurus* will grow to a height of about 3 feet in one season, and flower profusely. It is useful for conservatory embellishment during the month of September. In hot, dry weather, red-spider is apt to infest the plants. These remarks apply to the warmer parts of this country. *James Baxter, Boldre Grange Gardens, Hants.*

THE DISQUALIFICATION AT THE N. C. S. SHOW.

—That the judges were justified in disqualifying Mr. Lees' blooms there can be no doubt. But could not they have legitimately given the competitor the privilege of substituting another bloom if he had a distinct variety in his possession? Mr. E. Molyneux and Mr. Orchard took this course at the Portsmouth show, and allowed a competitor (Mr. Agate) to change a bloom, thus avoiding disqualification. I must add, however, that last year another exhibitor (Mr. Foster) was disqualified by the same judges unconditionally for the same blunder. What was the judges' duty in one case was not apparently theirs in a similar one. I do not think any of my fellow competitors would have objected if the more lenient course had been adopted in Mr. Lees' case. There is another point about the N. C. S. show; one of the judges was seen assisting an exhibitor to stage his blooms, and an hour or so afterwards was judging that very class. Another judge was questioning exhibitors in the Japanese classes while they were staging their flowers, and had subsequently to judge those classes. Really, it would appear that judges should not be allowed in the building before the exhibits have been staged, and the competitors have retired. *A Competitor.* [Of course not. Ed.]

HARDINESS OF CROCOSMIA AUREA.—In reply to a question on p. 324 of the *Gardeners' Chronicle*, I am afraid this bulb and its variety *italica* are less hardy than *Tritonia* (*Montbretia*) *Potsii*, and from their more erratic habit would be less easy to protect in winter by littering the surface. I have had *Crocsmia* out for three winters, and neither this nor any of its hybrids with *Tritonia* has been killed; but the winters here have been mild, and I put a foot of Pine-needles over the bulbs, nearly to the top of the stalks, which are never cut down till spring. I do not believe that either *Crocsmia* or *Tritonia* would survive without protection three weeks' severe frost, descending a foot or more into the soil. But it is easy to lift the *Crocsmias* in November, and pot them roughly and hastily three in a pot, and bury them 2 feet in an old rubbish-heap, or any place where they will get neither dry nor heated. *C. Wolley Dod, Edge Hall, Malpas.*

AUTUMN VERSUS SPRING DIGGING.—I was much interested in some remarks which appeared in the *Gardeners' Chronicle* last year under the above heading, and to test the matter for myself, I had two pieces of land in our orchard manured in the same manner. Some growing Mustard was dug in, and a light dressing of half-decayed stable-manure was given. The pieces of land were 120 yards long, and 6 yards wide. One piece was dug before Christmas, and the other in March. The kind of soil is a light sandy loam. I had both lands planted on the same day with the same variety of Potatoes, and at lifting time, on measuring the respective yields from the winter and spring-dug ground, I found no difference in quantity or quality. The lesson this experiment appears to teach is, to do the digging when the weather is favourable; and as this applies in my case to light ground, it is, I consider, important to throw up stiff and heavy ground to the action of the winter frosts and winds, and to give the soil a full opportunity to absorb the free nitrogen from the atmosphere. I may add that the allotments in our parish are mostly stiff, heavy land, and the man who was the most successful exhibitor at our local show, both for produce and general culture, always had his ground dug before Christmas. *R. M., Newbury.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

NOVEMBER 8.—*Present:* Dr. M. T. Masters, in the chair; Rev. W. Wilks, Mr. Michael, Prof. Church, and Rev. Prof. Henslow, Hon. Sec.

Potatoes with Scab.—With reference to some diseased tubers received some time back, Dr. W. G. Smith (Leeds) reports as follows:—

Almost simultaneously with receipt of specimens from the Scientific Committee, other specimens were received from the *Gardeners' Chronicle*. Both sets of material showed a well-marked form of "scab" involving the tip or growing end of every tuber. Freshly-cut sections showed a mycelium inside the tubers, both in discoloured and normally coloured parts. The first result of cultivation was an abundant crop of a Mucor (white mould), which soon passed into the zygosporous resting stage. An abundant crop of bodies of a fungus nature were also present about this time in active growth. Later several other fungi appeared. The rotten parts showed the presence of bacteria, white mites, and nematode worms. *Phytophthora* was not met with in course of the examination.

The "scab" disease has been ascribed to (1) various fungi; (2) bacteria; (3) nematode worms; (4) mites; (5) an organism of a slime-fungus nature (*Pseudocommis*). The material examined was not suited to discriminate the actual cause of the disease, because four of the above agencies were present in company. The presence of a fungus mycelium in freshly exposed sections inclines me to give the precedence to some fungus. In the cases examined, moss-litter from a stable was used largely in one case; the other had also been manured with moss-litter manure, but the source and quantity are not stated. This would seem to indicate that such manure offered good nourishment to the fungus. Comparing my results with other cases recorded, I am inclined to think that the fungus (another cause) came from the soil.

Investigations on Potato-scab have been often made in the United States, Belgium, Germany, and France. No definite cause has as yet been fixed on, but experiments in preventive treatment have been fairly successful. Of the latter the following have been tried in the United States and in Europe:—

1. Corrosive sublimate—the favourite substance used in the United States. When seed-tubers are treated before planting out with one part of the sublimate in 1000 of water for one to two hours, good results generally follow, although some experiments on badly infested land were negative.

2. Sulphur—also an American favourite remedy. The seed-tubers are thoroughly dusted with flowers-of-sulphur before planting. One authority speaks highly of good results from 300 lb. sulphur per acre applied in the open row, like artificial manure, from a drill distributor. The same writer is also in favour of a mixture of sulphur and kainit at the rate of 8.0 lb. per acre.

3. Kainit, for application to land known to be infested. This seems to me a safe cure, and it is favourably reported on.

Fruiting of Akebia quinata.—Foliage and ripe fruit of this berberidaceous climber were received from the Dowager Lady Bowman. They were grown in the open at Joldwynds, near Dorking. It is a native of Japan, and, as a rule, does not perfect its fruit in this climate.

Cyclamen europæum with long Rhizomes.—Some plants were sent by Rev. C. Wolley Dod, showing how this plant can produce its tuber several inches below the surface, by means of a long rhizome penetrating vertically through the surface-soil. At the base of the rhizome was the globular tuber. Perhaps this may have resulted from the prolonged drought, so that the tuber might be produced away from its influence.

Proliferous Teasel Head.—Dr. Masters exhibited a specimen in which the bracts of the summit had become foliaceous. An examination by Mr. Massee of the tissues showed the presence of the fungus *Sclerotinia libertiana*, both the sclerotia and the botrytis form being present. The probability is that the fungus has stimulated the bracts into their abnormal growth.

Cankered Apple-trees.—Dr. Masters also exhibited branches of Apples swollen by Mistletoe, but within cracks of the bark there was present the fungus *Nectria ditissima*. He remarked that removal of the grass, through loosening the soil about the roots by forking it over, and by applying manure, the canker had disappeared from the trees so treated.

Lavender with dimorphic leaves.—Dr. Masters called attention to sprays of Lavender on which the majority of the leaves were small, grey, with stellate hairs, and with inrolled margins, these characters being acquired by many plants frequenting arid and hot regions. Some of the leaves, however, were much larger, dark green, and flat, such being characteristic of plants in a moister climate. The different appearance of the latter is caused, according to Prof. Henslow, by there being much fewer hairs, and these, instead of having long and very slender branching rays, have only extremely short ones, with scarcely any branches; consequently they scarcely overlap each other, and so reveal the green chlorophyll below and between them. With regard to the stomata, they are about equally and very sparingly distributed. They occur on both sides of the leaves.

Potatoes blackening when boiled.—Mr. Rd. Morse forwarded raw and cooked Potatoes, to show the difference in those

cocked as grown in a field and in the garden. The latter were much blackened, but not the former. They were the variety Windsor Castle. The soil of the field sent was very red from the presence of iron, consequently there was very little doubt that the tannic acid, being liberated by boiling, united with some salt of iron imbibed, producing tannate of iron, the usual ingredients of ink. Beyond being somewhat unsightly, nothing of a deleterious character was present. Mr. Michael observed that it was of common occurrence in the peaty soils of Skye, and even preferred by the local inhabitants.

A Monstrous Begonia.—Dr. Masters showed a male flower, which the central axis was prolonged into a small funnel-shaped structure on a slender pedicel (see fig. 107, p. 365). Similar structures are not uncommon, as foliar excrescences from the ribs of Cabbage-leaves, and the ovules of Mignonette, have been transformed into similar funnels or cups, as described by the late Rev. Prof. J. S. Henslow.

Structure of the Seeds of the Indigo Plant.—Professor Church alluded to a curious discovery he had made in investigating the seeds of some wild species of Indigofera, as *linifolia*, *cordifolia*, and others. He found that sections of the embryos showed a marbled surface, having brownish patches, due to the colouring matter erythrophyll. On boiling crushed seeds to test for starch, not any was found, 33 per cent. being albuminoid matter; hence these are the most nitrogenous of all leguminous seeds known. On the solution being left, the true indigo-blue separates and becomes insoluble. Thus, there are two quite independent colouring matters in the same seed. The solution being red, the blue formed a ring round the porcelain vessel containing it.

NATIONAL CHRYSANTHEMUM.

The reference made in the *Gardeners' Chronicle*, p. 339, to your excellent leader of the previous week, alluding to the recent action of the National Chrysanthemum Society's Executive Committee, has most assuredly emanated from one who is behind the scenes, and acquainted with the inner working of the Sub-committee, as well as of the work of the executive body. While I in a measure am in agreement with your correspondent that "financial considerations" was one of the points by which they were "actuated," I can cheerfully state, as a member of that Sub-committee, that to attain nobler objects was also our aim; the elevation of the tone of the Society, by endeavouring, as far as possible, to procure a more congenial home, where the magnificent contributions sent for exhibition could be better seen, and more agreeably enjoyed.

Since the Jubilee banquet, November, 1896, several of the members who were appointed on the Sites Sub-committee have been most desirous of furthering, as far as lay in their power, the wishes and suggestions then made at the Hôtel Métropole by the Vice-Presidents, Sir Trevor Lawrence, Bart.; F. A. Bevan, Esq.; C. Harman Payne, Esq.; and other supporters of the Society.

Unfortunately for those of the executive who upheld the views expressed by those gentlemen, they have never received any sympathy or support (in trying for a better home) from the leading officials of the Society. Your correspondent questions the correctness of the allusion you made to the sub-committee's "almost unanimous recommendation," for a change to the Crystal Palace. That sub-committee consisted of five elected members and four officers *ex officio*, i.e., the Chairman, Vice-chairman, Treasurer, and Foreign Corresponding Secretary. From first to last the Foreign Corresponding Secretary took no part in any of the sub-committee's proceedings, and expressed no wish openly or otherwise for the change; therefore, in my opinion, your correspondent had no right to include him as opposed to the recommendation. The Chairman was also absent from the meeting on the night the voting took place, and as he never has openly expressed to the sub-committee his opposition against removing, your correspondent should not include him as voting against it.

It will thus be seen that when the recommendation was agreed to, two of the committee were absent, seven were present, all taking part in the proceedings. Six voted conscientiously for a removal (the five elected members), and the Vice Chairman, and one, the Treasurer, against. The information you gave, I hold, was therefore "quite correct."

Any one of the deputation that waited on Mr. Gilman, the manager of the Crystal Palace, cannot be reasonably blamed if they arrived at the same conclusion as I did, that both Chairman and Secretary were not then, to all outward appearances, adverse to the Society's removal to Sydenham, and in many cases they favoured the facilities so kindly and courteously assented to by that gentleman.

Your correspondent's allusion that Mr. Dean's "long experience" should "count for something," had nothing to do with the question at issue; he had no vote, and he accepted his appointment as general secretary on those conditions, but assuredly his abilities could be better seen, and his "long experience" more fully appreciated in a building where greater space, better light, and freedom from noise are found, and where the devotees of the autumn queen of flowers could worship in peace and quietude.

The question of table space raised is also somewhat beside the mark, still, all or more could be erected at the Crystal Palace with better advantages than can ever be obtained at the Royal Aquarium. It is true that shows held there are now "well-known London fixtures," but does that go to prove that the building in which they are held is either the most suitable or the best place to hold a gigantic floral display in. More than two decades have passed away since the

exhibits of the society were first located therein, and what at that time may have proved both suitable and convenient for the society's work has, by later experience, proved more or less objectionable.

Financially, the National Chrysanthemum Society has been able to make but little headway. The reserve fund of the Royal Aquarium during the past six years has been built up to £20,000. Contrast with this the reserve fund of our society after twenty-two years' labour under the same roof; we can only boast of £58. In comparison with the attendance at large provincial Chrysanthemum societies, we know that the Royal Aquarium must in November make a large profit by us. Should this then not show that "financial considerations" which your correspondent uses as a weapon against us, was a right and proper subject for us to consider? The "success and prosperity" that have followed the work of the National Chrysanthemum Society have also greatly enriched the exchequer of the Royal Aquarium. The status made for the society has also been the means whereby the substance has been secured for the directors of that company, while we have too long been content with the mere shadow.

It is regrettable that what is by some considered the most influential special floral society in the world should be fettered to a home where neither space, light, or comfort have been adequate during recent years. Yet under such conditions, we are again told that "the knowledge that the association of the Society and its exhibition with the Aquarium has done so much to enhance its success and prosperity." "Tut, tut!" This success and prosperity is not, in my opinion, the result of the building, or even its "central position," or the "bountiful" assistance received for services rendered; it arises mainly from the popularity attached to the flower, and to the unflinching enthusiasm and attention which is brought to bear in perfecting its culture, both by the able help of the gardening press and the multitude of intelligent cultivators in almost every part of the civilised world.

Had the present National Chrysanthemum Society commenced its career under better auspices and on independent lines, I venture to assert that its financial position to-day would have been something to be proud of. For these reasons, I maintain that we ought to receive from the directors of the Royal Aquarium the value of our labours annually, and in proportion to the profits they yearly reap through our exhibitions. *J. W. Moorman, Victoria Park, November 7, 1898.*

NOVEMBER 14.—The Floral Committee of this society met in the gallery of the Royal Aquarium on Monday last, when there were many novelties of first-class quality exhibited. The nine following varieties were awarded First-class Certificates:—

MRS. W. HOWE, an incurved, well-built flower of a peculiar and attractive shade of yellow. It was shown by Mr. W. Howe, gr. to Sir H. Tate, Bart., Park Place Gardens, Stratham, who has no knowledge of the variety's origin, being unaware how he became possessed of the three plants.

MISS ANNIE HILLS, a magnificent incurved, possessing the best qualities of this section, and most typical broad florets. Should the flowers eventually prove to be a little more conical in shape than were the twelve fine blooms that were shown, it will be an advantage. The colour is white or bluish, and the flower is not unsuggestive of a bluish Queen of England. Shown by Mr. H. Weeks, Thrumpton Hall Gardens, Derby.

C. S. BATES (incurved). This is a very fine shade of yellow, near to old-gold. The flowers shown were large, but hardly so truly incurved as might be wished. Possibly the variety was not shown in its best form. From Mr. R. Owen, Maidenhead.

HANWELL GLORY (incurved), a very promising buff-coloured flower, of satisfactory build. From Mr. W. Seward, The Firs, Hanwell.

H. J. JONES (Japanese), this intensely rich crimson-flowered variety will undoubtedly cause a sensation. It is of full exhibition size, the florets are moderately broad, very freely produced, do not incurve, but rather reflex a little towards the tips, and the whole flower is a mass of the richest bright crimson. The only suspicion of buff is in centre of flower, where the last florets are unfolding. From Mr. W. Seward, The Firs, Hanwell.

MADAME GABRIELLE DEBRIE (incurved Japanese), this is a delicate fleshy pink-coloured flower, with wide florets, and in build of the same type as Louise. (H. Cannell & Sons, Swanley.)

MADEIRA DAVIS (Japanese), a pretty flushed or tinted flower of large size, and possessing a fine centre. The build is somewhat suggestive of Pride of Exmouth. From Mr. W. H. Lees, Trent Park Gardens, Barnet.

JNO. POCKETT (Japanese), this very fine Australian flower, crimson, with buff or bronze reverse, has already been described in these columns. It is a very desirable acquisition, the florets are wide, and the crimson and buff is almost equally displayed over the flower. From Mr. W. Wells, Earlswood Nurseries, Redhill.

LE CHALONAIS (Japanese Anemone), a very pretty yellow-coloured flower, of moderate size and good form. In the cushion the yellow is intermixed a little with a reddish tint. From Mr. H. J. Jones, Ryecroft Nursery, Lewisham.

Other interesting novelties included Mrs. A. Kember (Commended), a yellow sport from Mrs. Dr. Waid, from Mr. A. Kember, Gosfield Hall, Halstead; P. R. Dunn, a white-flowered Japanese Anemone; Mrs. W. Bird, a fine crimson single-flowered variety; Yellow Eva Knowles, which the committee wished to see again; and Joseph Chamberlain,

certificated last year, all from Mr. H. J. Jones; Golden Shower, What Ho, and other very distinct, "spidery," decorative, varieties from Mr. J. H. Witty, Nunhead Cemetery. It is probable that the variety Golden Shower, the petals of which are like mere threads, and fall immediately down around the flower-head, would have been given a certificate had the committee's requirement been complied to in regard to plants of decorative varieties, being shown in addition to blooms. Mrs. A. H. Hall, large yellow flowered Japanese, and J. C. Waterhouse, also a yellow Japanese, but less smooth in outline and deeper in colour, from Mr. A. H. Hall, Prestbury.

Several colour sports from Source d'Or from Mr. H. Holmes, King Street, Norwich; Pearl Palace (incurved), from Mr. R. Owen; and Mrs. Grogan, a grand, rose-coloured flower suitable for market or decorative purposes, from the Brighton and South Coast Nurseries, Worthing. The committee wished to see plants of these. Mr. W. Wells had fine blooms of Chatsworth, Nellie Pockett, and Mr. T. Carrington.

NORTH OF SCOTLAND ROOT, FRUIT, AND VEGETABLE ASSOCIATION.

NOVEMBER 5.—The annual show of roots, fruit and vegetables, in connection with this Association was held on the above date, in the new Drill Hall, Inverurie. The weather was exceedingly fine, and in the new Hall and outside grounds the display of produce was seen to advantage.

Of garden produce there was an exceptionally fine display. Fruit did not make a large display in the aggregate, but the general quality of the Apples was very good. The chief prize-takers in this section were Mr. T. MIDDLETON, gr., Monymusk House; A. CAMPBELL, A. MIDDLETON, A. BEATON, and J. OOSTON, Bourtie House.

The display of vegetables was the finest that has been seen at Inverurie for many years.

The usual dinner of the Association was held in the Gordon Arms Hotel in the afternoon, and was very largely attended.

ISLE OF WIGHT.

SHANKLIN.

NOVEMBER 8.—The Shanklin Chrysanthemum Society held their annual exhibition, and although a falling off in the number of exhibits was evident, the good quality of previous years was fully maintained. The principal prize-winners were Messrs. M. Silsbury, G. Burt, W. Howard, S. Prissall, E. Rayner, C. Orchard, G. Kingswell, G. Jolliffe, S. Banks, and W. Morris.

EAST COWES.

The East Cowes Horticultural Improvement Association held their first annual Chrysanthemum show in the Town Hall on Wednesday last, when some very fine groups of these plants were staged by Messrs. M. Hunt, W. Hills, A. Hills, and C. Martin. The principal prize-winners for cut blooms were Messrs. A. Hills, T. Burne, W. Broadwater, F. Fry, J. G. Oatley, and C. Coombes.

VENTNOR.

The annual show in connection with the Undercliffe Chrysanthemum Society was held on Thursday and Friday last. The show was considered a very great improvement upon last year's exhibition. The principal prize-takers were Messrs. C. H. Snook, H. Dover, F. Woods, W. Howard, W. Miller, W. Russell, W. W. Sheath, F. Attrill, D. Day, A. E. Gell, W. Gee, and A. Richards.

HIGHGATE CHRYSANTHEMUM.

NOVEMBER 8, 9, 10.—The fourteenth annual exhibition of the above Society was held at Holloway Hall on the above dates, and proved very successful. In every respect it was a great advance on previous years. This year, 960 exhibits were staged, as against 800 last year; and the cut blooms numbered 2040, as against 1583 for 1897.

The spacious Holloway Hall was completely filled, and the smaller hall had to be used in addition for staging the cottagers' exhibits. The Japanese cut blooms were large and of good colouring, all the best known varieties being represented. Some of the incurveds, too, were praiseworthy, and Pompons and Anemones were represented. Table decorations were numerous, and of good quality; and the same may be said of bouquets and baskets of Chrysanthemums with Ferns, grasses, and foliage.

The groups were not numerous, but the plants were good specimens of the best varieties, and in the case of trained specimen plants, there were some exceptionally good exhibits.

Mr. J. Brooks, gr. to Mr. W. J. NEWMAN, of Totteridge, for the second time in succession, won the Ten-guinea Silver Cup, given by Mr. H. R. REGNART, with forty-eight Japanese blooms of not fewer than twenty-four varieties; while Mr. J. Brooks, gr. to Mr. WALTER REYNOLDS, J.P., Highgate, carried off the 1st prize for groups and trained plants. The cottagers' exhibits were all very creditable indeed, and one of the judges declared that the six specimen plants staged by Mr. F. J. WRIGHT, of Salisbury Terrace, Finchley, could not be beaten by any cottager.

Amongst cottagers' exhibits was a basket of Custard Marrows shown by Mr. TOMLIN, of Finchley, which had been grown from seeds obtained last year from Philadelphia.

COVENTRY CHRYSANTHEMUM.

NOVEMBER 8, 9.—A very pretty show was held on the above dates in the Market Hall, Coventry, which, though not a very suitable place, willing hands had helped to give it a pleasing aspect by means of curtains, and Palms and other plants of large size, kindly lent for the occasion by gardeners who were members of the committee, and their employers.

GROUPS OF CHRYSANTHEMUMS

were well shown in the competitive classes by Sir R. MOON (gr., Mr. Morris), who secured the 1st prize, and by W. H. HERBERT, Esq. (gr., Mr. Blake), who was 2nd. A. JAMES, Esq. (gr., Mr. Chandler), easily secured 1st place in the cut bloom classes for twenty-four Japanese, and for twenty-four incurved varieties.

A fine display came from Lord LEITCH's gardens, Stoneleigh Abbey (gr., Mr. Martin), consisting of excellent fruit and vegetables in season.

Some excellent blooms of Chrysanthemums also came from Mr. MARTIN, of Stoneleigh Abbey Gardens.

Messrs. PERKINS, florists, of Coventry, contributed a number of artistic articles worked out in flowers and greenery, the Chrysanthemum forming appropriately a considerable proportion of the flowers employed in their construction.

Mr. FINCH, nurseryman, erected a lofty arcadian group in the centre of the hall, and this was very effective, surmounted as it was with Palms, and intermingled with Codæums, Dracenas, Eulalias, Orchids, and other plants. The same exhibitor contributed floral decorations in variety.

BIRMINGHAM CHRYSANTHEMUM.

NOVEMBER 8, 9, 10.—The annual show of the above Society took place in the Bingley Hall. The exhibits on the whole were very satisfactory, but the cut blooms of Japanese varieties were hardly so large as usual. The incurved flowers were bright in colour, and large in size. We think, also, that they were better dressed than is usual at Birmingham. Trained specimen plants were as good as formerly.

PLANTS.

For nine plants of large flowering incurveds, Lady MARTINEAU, West Hill (gr., Mr. O. Brasier), was the winner of the 1st prize. She had capital specimens of Prince Alfred, Golden Empress, C. H. Curtis, Queen of England, R. C. Kingston, Empress of India, Lord Alcester, Jardin des Plantes, and Lord Walseley; Mr. G. CADBURY, Northfield, Birmingham (gr., Mr. J. Maudrum), was 2nd.

For six plants, Mr. G. CADBURY was 1st.

For six plants (Japanese), Lady MARTINEAU won; fine plants were included of Duchess of Wellington, Col. W. B. Smith, and Australia.

The best plants in the show were staged in the class for three Japanese specimens, and these were from Mr. G. CADBURY.

The best group of Chrysanthemums, with foliage plants, to occupy a space of 20 feet by 12 feet, was from Mr. Geo. MENZIES, gr. to R. CADBURY, Esq., Moseley. There were five exhibits. In most instances a too free use was made of Eulalias. The competition was keen. Mr. J. Maudrum, gr. to G. H. KENDRICK, Esq., Whetstone, was 2nd.

For a smaller group of Chrysanthemums and other plants, G. CADBURY, Esq., was a good 1st among five exhibitors.

Primulas and Cyclamens were shown well, but some of the Primulas were decidedly over-potted, being in 10-inch pots. The chief winners in these classes were Mr. CROOKS, Messrs. THOMSON & SON, and Messrs. POPE & SONS.

R. CADBURY, Esq., had the best table plants.

CUT BLOOMS.

In the important class for twenty-four incurved blooms, distinct varieties, there were eight competitors, Mr. Chas. CROOKS, gr. to the Dowager Lady HINDLEIGH, Hadsor, Droitwich, was placed 1st, staging a beautiful collection of fresh and large blooms. His varieties were Duchess of Fife, William Tunnington, Chas. H. Curtis, Madame Ferlat (very fine), Major Bonaffon, Empress of India, Miss Dorothy Foster, Topaz Orientale (a fine variety), J. Agate, Golden Empress, Queen of England, Robt. Petfield, John Lambert, Miss Foster, Lady Isabel (a grand bloom), Lord Alcester, Brookleigh Gem, Miss Eaggas, Mrs. Heale, Robt. Tomlin, Jeanne d'Arc, Mrs. S. Coleman, and Lucy Kendal; the 2nd position was occupied by Mr. J. H. Goodacre, gr. to the Earl of HARRINGTON, Elvaston Castle, Notts.

For twenty-four Japanese, distinct, S. LODGE, Esq., Floore House, Weedon (gr., Mr. Pearce), was a good 1st out of eight competitors. Mr. Pearce has taken 1st prize in this class for some years previous to last season, when he was beaten. This season Mr. Pearce was well 1st. Amongst his varieties the following were interesting:—Pride of Exmouth, Elthorne Beauty, Madame Gustave Hardy, Mr. J. Lewis, Robert Powell, Graphic, G. J. Warren, Duke of Wellington, Lady Hanham, Madame Carnot, M. Chenon de Leché, Lady Ridgway, Mrs. C. Blick, National Chrysanthemum Society's Jubilee, and Edith Tabor. Mr. C. J. Salter, gr. to T. B. HAYWOOD, Esq., Reigate, Surrey, was 2nd, having a very good collection of blooms. Mr. W. H. Lees, gr. to F. A. BEVAN, Esq., Trent Park, was 3rd.

For eighteen incurveds, Mr. CHAS. CROOKS was again 1st. There were seven exhibitors of collections of eighteen Japanese blooms, Mr. E. S. COPE, Redditch (gr., Mr. F. Seany), was the best. In this stand was a very fine bloom of Mons. Chenon de Leché, the best specimen of the variety in the show. The 2nd prize was taken by Mr. R. Jones, gr. to C. A. SMITH-RYLANDS, Esq., Warwick.

Mr. C. CROOKS had the best collection of twelve incurveds, distinct; and Mr. R. JONES was 2nd.

Mr. C. J. SALTER obtained 1st prize for twelve Japanese incurveds. One of his best blooms being a fine one of the variety *Australis*.

The best variety shown in sixes was Mrs. Philips Rivoire, from Mr. R. JONES.

The best yellow Japanese was *Phœbus*, from Mr. CROOKS.

In the class for twelve Anemone-like blooms, Mr. C. J. SALTER staged a very nice collection, his best blooms being *Delaware* and Mrs. Jules Benedict.

For twelve Japanese and twelve incurved blooms, Mr. A. Darley, gr. to H. W. ELLIOTT, Esq., Selly Oak, won with a very even lot of blooms of moderate size.

DECORATIVE CLASSES.

For a display of floral arrangements to occupy a space not exceeding 20 feet by 6 feet, Mr. CROOK, of Edgbaston, Birmingham, was a decided 1st. Many floral devices of *Chrysanthemums* were illustrated, and the best taste was evident. Messrs. POPE & SONS, King's Norton, Birmingham, secured 2nd place with a heavy, sombre-looking, but novel exhibit.

For twelve specimen *Chrysanthemum* blooms, arranged in a space 3 feet 6 by 3 feet, Mr. R. CABBURY was the winning exhibitor, there being four others. The blooms were interspersed with *Codiaeums*, &c.

FRUITS AND VEGETABLES.

For six bunches of Grapes, Mr. Geo. Mullins, gr. to Lady H. SOMERSET, Eastnor Castle, was 1st; Mr. J. H. GOODACRE, 2nd. Mr. Mullins' exhibit was very fine. There were numerous exhibits of Grapes, and the quality was unusually good. The chief prize-winners were Mr. BARNES, Mr. MULLINS, and Mr. GOODACRE.

There were classes for Apples and Pears. These were well filled, and the quality was generally satisfactory.

Vegetables were capital. For Messrs. WEBB's prizes the Earl of CARNARVON, Highclere Castle, Newbury (gr., Mr. Pope), was 1st. Mr. C. ALSTON was 1st for Messrs. POPE & SON's Collection; and Mr. CROOK for Messrs. SIMPSON & Co.'s Prizes.

NON-COMPETITIVE EXHIBITS.

An exhibit that attracted much attention was one from Her Majesty the QUEEN, Windsor (gr., Mr. Owen Thomas), who staged about 140 or 150 dishes, including Apples, Pears, Medlars, Plums, Quinces, Pines and Grapes; the stand was about 25 feet by 15 feet, and in the centre was a large vase, furnished with Palm-leaves, Bamboo-branches, *Asparagus deflexus*, *Berberis* berries, and *Chrysanthemum* blooms. There were also four corner vases. (A Gold Medal was awarded to this exhibit.)

Mr. A. F. WALTON was awarded a Gold Medal for a large representative collection of Cactus plants.

A large exhibit was made by the Right Hon. JOSEPH CHAMBERLAIN, M.P., consisting of stove and table-plants, Orchids, Primulas, *Begonia Gloire de Lorraine*, *Pelargoniums*, *Cyclamens*, *Chrysanthemums*, &c. (Gold Medal).

Messrs. SUTTON & SONS, Reading, were awarded a Gold Medal for a stand 100 feet in length, consisting of Potatoes, hardy plants, &c.

Messrs. JOHN LAING & SONS, Forest Hill, London, staged a collection of Apples and plants (Gold Medal).

Silver Medals were also awarded to several other firms for meritorious exhibits. H. K.

HANLEY CHRYSANTHEMUM.

NOVEMBER 9, 10.—The sixteenth annual exhibition was opened in the Victoria Hall on the above date. The society (which is affiliated with the National Chrysanthemum Society) has for patrons the Duke and Duchess of Sutherland, and for president the ex-Mayor (Mr. M. Tunnicliffe), with an influential list of vice-presidents, and an energetic committee.

The entries numbered 170, which is a slight increase on last year, and prizes to the value of £100 were offered. The cut-blooms were exceedingly fine; there was an increase in the number of the exhibits, but a falling-off in the number of grouped plants. The orchestra was decorated with a number of fine foliage plants from the Park, which had a very good effect.

Open Division.—Plants in Pots: Three Japanese, 1st, S. MONTFORD, Congleton. Group of *Chrysanthemums*, 1st, R. G. HOWSON, Shelton. Group of plants arranged for effect, 1st, R. G. HOWSON. Twelve table plants, 1st, J. C. WATERHOUSE, Presbury. Cut Flowers: Twenty-four cut blooms, incurved, eighteen varieties, 1st, the Earl of HARRINGTON, Derby. Twenty-four cut blooms, Japanese, eighteen varieties, 1st, R. W. D. HARLEY. Twelve cut blooms, incurved, distinct varieties, 1st, the Earl of HARRINGTON. Twelve cut blooms, Japanese, 1st, J. C. WATERHOUSE.

Open Amateur Division.—Plants in Pots: Six greenhouse plants or Ferns, 1st, E. DEAKIN. Cut Flowers: Twelve blooms, incurved, 1st, D. A. LEWIS. Six blooms, incurved, 1st, D. A. LEWIS. Twelve cut blooms, Japanese, six varieties, 1st, D. A. LEWIS. Six cut blooms, Japanese, distinct varieties, 1st, P. SIMPSON.

Amateur Division.—Cut Flowers: Twelve cut flowers, incurved, six distinct varieties, 1st, E. DEAKIN. Twelve cut flowers, Japanese, six distinct varieties, 1st, E. DEAKIN. Six cut flowers, Japanese, distinct varieties, 1st, E. DEAKIN.

Gentlemen's Gardeners' Division.—Twelve cut blooms, Japanese, six distinct varieties, 1st, A. S. DIX, Shelton. Six cut flowers, incurved, distinct varieties, 1st, JOHN MASKERY.

LIVERPOOL.

NOVEMBER 9, 10.—The annual autumn exhibition, held in St. George's Hall on the above dates, was, horticulturally, a successful one. Some alteration in the arrangement of the groups effected an improvement. The competition was scarcely so keen as in former years, still the show, as such, suffered but little. The most interest centred in cut blooms, for which a good money prize and a Challenge Cup were given for the best forty-eight distinct varieties. The competitors in this class numbered four, and as all the stands contained many fine examples, the result was good.

Mr. J. HEATON, gr. to R. P. HOUSTON, Esq., The Lawn, Aigburth, was a good 1st, having superior flowers of Japanese and incurved varieties, particularly *M. Chenon de Leché*, Lady Hanham, *E. Molyneux*, *Phœbus*, and *Australian Gold*; and incurved *Duchess of Fife*, Lord Alcester, Charles Curtis, and *Golden Queen of England*; Mr. G. BURDON, gr. to G. B. COCKBURN, Esq., Lingdale Lodge, Cloughton, was 2nd.

For eighteen incurveds there was a capital lot of entries, and fine blooms. Mr. J. DAVIES, gr. to — ELLIS, Esq., Dee View, Heswall, was 1st, having shapely blooms of popular varieties; Mr. C. OSBORNE, gr. to H. TATE, Esq., Allerton Beeches, was 2nd.

For the best twelve incurved varieties, Mr. W. DAWES, gr. to Lord TREVOR, Brynkenalt, Chirk, was 1st, with evenly-sized, not over-large blooms; Mr. E. BROADLEY, gr. to W. H. JONES, Esq., The Grange, Hooton, was 2nd.

The best eighteen Japanese varieties were those of Mr. C. OSBORNE, who easily took the 1st prize.

Mr. W. DAWES staged exquisite examples of Japanese varieties in the class for twelve blooms, and was an easy 1st, Mrs. Weeks, John Seward, Edith Tabor, and Charles Davis being especially fine; Mr. James Young, gr. to THE CHESHIRE LINE'S COMMITTEE, Otterspool, was 2nd.

Pompon varieties were grandly staged by Mr. E. Wharton, gr. to JOHN FINDLAY, Esq., Mavis Court, Sefton Park, in the class for twelve bunches, the blooms being perfect in form, of good size, and full, round, and suitably set up with their own foliage in bunches of three blooms.

The groups of *Chrysanthemums* mixed with foliage plants were, as previously stated, an excellent feature of the show. Mr. BRACEGIRDLE, gr. to W. H. WATTS, Esq., Elmtree Hall, Wavertree, was 1st, his plants carrying good blooms, evenly and lightly arranged in the group, and the *Crotons* that were used were very suitable for the purpose for relieving the blooms.

In the classes for eight trained specimens, there was an unfortunate falling off in quality, the only exhibit worthy of note being that for three Pompons. Here Mr. W. WILSON, gr. to H. CUNNINGHAM, Esq., Gorsey Cop, Gateacre, staged some abundantly-flowered plants.

Plants other than *Chrysanthemums*, are a feature at these shows, and some magnificent Palms and Ferns were exhibited whose handsome leaves and fronds could have been ill-spared in the decoration of the Hall. Mr. BRACEGIRDLE was adjudged 1st in each class.

Poinsettias were well exhibited by Mr. W. LYON, gr. to A. M. SMITH, Esq., Bolton Huy, Roby, the plants being from 2 to 3 feet high, with half a dozen heads of bracts each.

Orchids were noted in quantity. Mr. BRACEGIRDLE showing *Cattleya labiata* and *Cypripedium*. Messrs. J. COWAN & Co. staged an interesting lot of Orchids, Heaths, &c. Messrs. R. P. KIRK & SONS, Aigburth, a good exhibit of *Cyclamens*. Messrs. DICKSONS, Chester, Apples in variety.

NORTHAMPTON CHRYSANTHEMUM.

NOVEMBER 9, 10.—The twenty-seventh annual show was held on the above dates. The exhibits were of quite average quality, and some of the blooms shown by amateurs were very satisfactory.

GROUPS AND PLANTS.

For the best group of *Chrysanthemum* plants only, upon a space 8 feet by 7½ feet, there were only two competitors. The 1st prize was taken by Mr. ISAAC REEVE, gr. to Mrs. COULSON, Northampton, whose exhibit was of a very satisfactory character.

For a group of *Chrysanthemums*, 6 feet by 6 feet, Mr. W. KIRBY, Northampton, was 1st. This group contained some beautiful blooms, and was awarded a Silver Cup in addition to the 1st prize.

For six specimen plants of Japanese varieties Mr. ISAAC REEVE was again 1st.

Other autumn-flowering and ornamental foliage plants were well shown, and the chief prize-winners were Mr. SODEN, Mr. MANING, Mr. BARKAWAY, Mr. HEMMINGES, Mr. HINKLEY, Mr. AMOS SMITH, and Mr. BATEMAN.

CUT BLOOMS.

In the class for a table of *Chrysanthemum* blooms and Ferns and foliage plants, there were three competitors. Mr. Keightly, gr. to Sir HERWALD WEEKS, Courtenhall, was awarded 1st prize, for a superior exhibit; Mr. H. KEMPSTALL, gr. to Sir CHAS. E. ISHAM, Lamport Hall, was 2nd, with a pretty and effective arrangement of fine blooms. The best bouquet of *Chrysanthemums* was shown by Mr. BURROW, Northampton.

For eighteen Japanese blooms, distinct varieties, Mr. Wm. Pearce, gr. to Mr. S. LODER, Weedon, was 1st. Mr. Pearce staged some grand blooms, including *Elthorne Beauty*, *Pride of Exmouth*, *President Nonin*, Mrs. J. Lewis (very good), *Mons. Chenon de Leché*, Lady Ridgway, and Mrs. W. H. Weeks. Mr. COLES, gr. to Earl SPENCER, Althorpe, Northampton, occupied 2nd place.

For eighteen incurved blooms, distinct, Mr. PEARCE was again 1st, and included *Duchess of Fife*, C. H. Curtis (very good), *Ma Perfection*, Ernest Cannell, and Leonard Payne. Mr. COPSON took 2nd honours in this class.

For three Anemones and three reflexed blooms, Mr. Owen Soden, gr. to G. ADNITT, Esq., Northampton, was 1st; Descartes was very fine in this stand. Mr. COPSON was 2nd.

The best Japanese variety shown in sixes, was *Edith Tabor* from Mr. KEIGHTLY.

Mr. COPSON won an interesting class for six Japanese varieties introduced in 1897 and 1898, and showed Lady Hanham, Yellow Madame Carnot, *Beauté de Grenoble*, Robert Powell, Wertha, and Mrs. Maling Grant.

For the best twelve blooms of Japanese varieties introduced since 1894, Mr. S. COLE was 1st with *Mons. Chenon de Leché*, John Seward, *Mons. E. André*, Mrs. Mease, Robert Powell, N.C.S. Jubilee, Lady Ridgway, Mrs. J. Lewis, *Mons. Dieul Sillandria*, *Beauty of Teignmouth*, C. W. Richardson, and Eva Knowles.

The best incurved variety was C. H. Curtis, six nice blooms of which were shown by Mr. S. COLE.

FRUIT AND VEGETABLES.

Apples and Pears were shown well, and some good specimens were staged; the chief winners being Messrs. COLE, PEARCE, KEIGHTLY, ALEXANDER, and CORY. Mr. COLE was 1st for Black Grapes, and Mr. ALEXANDER for white Grapes. For eight varieties of vegetables Mr. KEIGHTLY was 1st, with a grand collection. Messrs. Sutton's prize for six varieties of vegetables was won by Mr. KEIGHTLY.

NON-COMPETITIVE.

There were several non-competitive exhibits. Messrs. THOS. PERKINS & SONS showed a large collection of fruit, plants, wreaths, and other floral devices. Mr. ARTHUR BAILEY and Mr. A. COCKERILL, The Drapery, Northampton, also showed floral devices, those from the last-named exhibitor being much admired for their superior quality. H. K.

MONMOUTH CHRYSANTHEMUM AND HORTICULTURAL.

NOVEMBER 9, 10.—This Society held its eighth annual show in the Rolls Hall, Monmouth, and it was the most successful exhibition the Society has yet held. The groups of *Chrysanthemums* were particularly meritorious, as were also the collections of Apples and vegetables.

There were five entries in the class for a group of *Chrysanthemums* in a space of 60 square feet, Mr. Phillips, gr. to J. M. BANNERMAN, Esq., Wyastone Leys, Monmouth, taking a good lead with plants having good foliage and very large flowers; Mr. PITT, nurseryman, Abergavenny, who followed, had likewise a good, although somewhat flatly-arranged group.

A. VIZARD, Esq., The Ancre Hill, Monmouth, was the only exhibitor of a smaller group.

Cut Blooms.—Twenty-four incurved blooms from Mr. PITT were the best—moderately large flowers, the best being C. H. Curtis, *Ma Perfection*, Lord Wolseley, and *Princess of Wales*.

Mr. PHILLIPS won for twelve incurveds, and had large, well-finished blooms of *Madame Darier*, C. H. Curtis, *Madame Ferlat*, *Globe d'Or*, Baron Hirsch, Mrs. Kingston, &c.; Mr. Lockyer, gr. to J. HANBURY LEE, Esq., Pontypool Park, closely followed.

In the class for twenty-four Japanese blooms, Mr. PITT was 1st with some grand blooms of G. J. Warren, *Duchess of York*, *Madame Carnot*, Mrs. J. Lewis, *E. Molyneux*, N. C. S.'s Jubilee, &c.; 2nd, Mr. Davis, gr. to W. G. WRIGHT, Esq., Quarry House, Hereford, who had larger flowers than those in the 1st prize stand, but not so uniformly well finished, or as well put up.

Mr. Spencer, gr. to C. H. MOFFATT, Esq., Goodrich Court, Ross, had the best collection of twelve Japanese blooms; and was followed by Captain HOPOOD.

Mr. JONES, Ryecroft Nursery, Lewisham, offered a Silver-gilt Medal for the best six Japanese blooms, which was won by Mr. SPENCER.

Fruit.—Mr. PITT had the best collection of six dishes of Pears; and Mr. SPENCER was 1st for a collection of six dishes of dessert Apples. Six dishes of culinary Apples were best shown by Mr. DAVIS.

The best three bunches of black Grapes were from Mr. LOCKYER, who had Black Alicante; and the best three bunches of white Grapes were Muscat of Alexandria, from the same exhibitor.

NON-COMPETITIVE EXHIBITS.

A fine collection (fifty dishes) of Apples and Pears, with a background of ornamental foliage-plants, was exhibited by Mr. COOMBER, gr. to Lord LLANGATTOCK, The Hendre, Monmouth. L. C.

LAUNCESTON CHRYSANTHEMUM AND FRUIT.

NOVEMBER 10.—The third annual exhibition, which was held in the Town Hall, Launceston, on the above date, was generally considered to be a great advance upon those that have been held by the Society.

The groups were good, the plants in almost every instance well bloomed; foliage generally free from rust, and the arrangement of the plants left little to be desired. For a

group arranged in a space not exceeding 80 square feet, Mr. J. Reuse, gr. to Miss GURNEY, was 1st, taking also the National Chrysanthemum Society's Certificate. This was a pretty group of plants, averaging 4 feet in height, with numerous fresh blooms of large size. Mr. J. Livermore, gr. to J. S. TREGONING, Esq., was 2nd; here the plants were taller, the flowers much smaller—still, it was a pleasing group.

For a group in a space of 60 square feet, Mr. Woodley, gr. to Miss MILNES, was 1st, with a capital arrangement, in which Ferns, grasses, and foliage plants were well employed; Mr. LIVERMORE was again 2nd.

For nine plants, with an average of six blooms on a plant, W. WEVILL, Esq., was awarded 1st, his plants being dwarf and the blooms good; Mr. J. Parsons, gr. to E. PETHYBRIDGE, Esq., had also good plants, but smaller blooms.

For a group of plants, of not fewer than twelve nor more than eighteen, the position of these last two competitors was reversed, Mr. PETHYBRIDGE's plants being full of flower.

CUT BLOOMS.

For twenty-four blooms (Japanese), in eighteen distinct varieties, G. L. ELLIS, Esq., was awarded 1st prize, with a very even lot of good blooms, and several newer ones among them; Mr. LIVERMORE was a close 2nd.

For twelve blooms (Japanese, distinct), The Ven. Arch. DU BOULAY came well to the front. Some capital stands of incurved blooms were shown by W. WEVILL, Esq., 1st for twelve; and 1st for twelve Japanese.

In the amateurs' class for twelve Japanese, G. L. ELLIS, Esq., was 1st, with a very even lot of blooms. This was a well-contested class. *A Correspondent.*

WINDSOR CHRYSANTHEMUM.

NOVEMBER 10.—A really good show was held in the Albert Institute, Windsor, on the above date. The competition was keen throughout, and the exhibits were good. Groups of Chrysanthemum plants were the feature of the show. Six exhibitors entered in the open class for the possession of the Challenge Cup, which is awarded with the 1st prize. Mr. W. Cole, gr. to Mrs. E. B. FOSTER, secured the Award with a commendable group; Mr. W. Davis, gr. to H. ADAMS, Esq., was 2nd. Mr. H. EDWARDS, 32, Albert Street, Clewer, Windsor, won a similar honour in the amateurs' division.

Mr. Fifield, gr. to T. CAWTE, Esq., staged the best specimen-plants, and these showed high cultural skill. A plant of the variety Mrs. G. Rundle was furnished with over 100 good blooms.

In the cut-bloom section, Mr. Sturt, gr. to L. COHEN, Esq., Engleford Green, won the 1st prize for twenty-four Japanese varieties; and Mr. Lane, gr. to Miss RIDGE, Ascot, was 2nd. Mr. Lane won for twenty-four incurveds and the Challenge Cup for twelve Japanese, and a like number of incurved varieties; also for six Japanese blooms of one variety.

Mr. J. Wood, gr. to Lord BOSTON, won for twelve Japanese blooms, showing large and fresh specimens; also for six incurved flowers of one variety, this being C. H. Curtis.

Mr. W. COLE staged the best Anemone blooms, and won premier position.

Baskets of Chrysanthemums and foliage of any kind, made, as they always do here, a grand display. Mr. LANE, with excellent examples of Japanese varieties, associated with suitable autumnal foliage, won the coveted Award. Mrs. BARGRAVE WYBORN secured a like Award in the class open to ladies only.

Fruit and vegetables were numerous and good.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 10.—The last meeting of this society took place at the Coal Exchange, Manchester. Present: Messrs. G. Shorland Ball (in the chair), Law-Schofield, Greenwood, Leemann, Gratrix, Weathers, Johnson, and Mills (hon. sec.).

The following is the list of the First-class Certificates and Awards of Merit given at the meeting:—

SAML. GRATRICK, Esq., Whalley Range (gr., Mr. McLeod), showed *Cypripedium insigne Ernesti* (First-class Certificate); *Cypripedium Grovesianum* (Lathamianum × *Leeanum*) (Award of Merit); *C. Ashburtoniae giganteum* (Award of Merit); *C. Leeanum aureum* and *Laelio-Cattleya Amelia* (amethystina × cinnabarina) (Award of Merit).

THOMAS STATTER, Esq., Whitefield (gr., Mr. Johnson), showed *Dendrobium bigibbum*—Stand Hall variety (First-class Certificate); *D. Phalaenopsis Schroderianum* (Cultural Certificate); *Laelio-Cattleya Statterianum* (Laelio-Perrini × *C. labiata*) (Award of Merit); *L.-C. Ascania*, *Cypripedium insigne Johnsoni* (Award of Merit), and *C. insigne superba*. The same exhibitor also staged a very fine group, for which a Silver-gilt Medal was unanimously awarded.

Messrs. CHARLESWORTH & Co., Bradford, showed *Cypripedium Jeanette* (niveum × *Leeanum*) (Award of Merit); *C. Lilian*, and *C. callosa*—Warneri.

Mr. JOHN ROBSON, Altrincham, showed *Cattleya labiata*, *Odontoglossum crispum*, *Cypripedium Charlesworthi*, and *C. Leeanum giganteum*. A group was also staged by this exhibitor, which received a Vote of Thanks.

FRED HARDY, Esq., Ashton-on-Mersey (gr., Mr. Stafford), exhibited a small group, in which was included *Cattleya Hardyana* and *Laelia praestans alba* (a Vote of Thanks was awarded). *Communicated.*

HARROGATE CHRYSANTHEMUM.

NOVEMBER 10, 11.—The fourth annual show of this Society was held on the above dates, and was attended with increased success. The entries in all classes were good, and the exhibits were far above the average quality.

Groups.—In the class for a group of Chrysanthemum plants only, Mr. J. PETTINGER was 1st, and E. B. FABER, Esq. (gr., Mr. W. Townsend), 2nd, who, having entered in most of the group classes, was in this case beaten.

In the open class for a group of miscellaneous plants, including Chrysanthemums and Orchids, E. B. FABER, Esq., was easily 1st, and the arrangement was most effectual. In the foreground of the group was arranged a beautiful group of Orchids, including some charming sprays of *Oncidium Rogersii*, and many other Orchids. 2nd, The QUEEN HOTEL Co., Harrogate.

Cut Blooms.—For twenty-four Japanese varieties, A. WILSON, Esq., Tranby Croft (gr., Mr. Leadbetter), was 1st; he staged some good, well-finished blooms, among others, Emily Silsbury, Graphic, Edith Tabor, Lady Ridgway, International, and Eva Knowles.

For twenty-four incurveds, A. WILSON, Esq., was 1st, who staged Princess of Wales, Lucy Rendell, Ma Perfection, Golden Empress, Madame Forlat, C. H. Curtis, &c.; 2nd, C. H. SIMPSON, Esq. (gr., Mr. Retchell).

Fruit was well shown, an especially fine collection of Apples and Pears being staged. For a collection of six varieties of fruits, A. BROTHERTON, Esq., Arthington Hall, was 1st, his collection including some fine Muscat Grapes.

The best six dishes of baking Apples were from Lady COWELL, Clifton Castle (gr., Mr. Lee).

Florists Exhibits.—Some very charming bouquets and other devices were shown. In the class for one hand-bouquet, the competition was keen. 1st prize, W. BONNALL, Harrogate; 2nd, A. J. HALL, Harrogate. All were excellent, and greatly admired.

Messrs. BATCHELOR, BONNALL, and HALL each staged a display of floral devices, not for competition, and these were a great centre of attraction during the show.

The Harrogate Committee are especially fortunate in having such an excellent hall for their show, it being held for the second time in the Winter Garden recently erected in connection with the baths; and when lit up by the electric light in the evening, and viewed from the staircase at the entrance, the hall presented a charming effect.

BECCLES CHRYSANTHEMUM AND HORTICULTURAL.

NOVEMBER 10, 11.—The ninth annual show of this Society was held in the Town Hall, Beccles, on the above dates. The show, on the whole, was equal in quality to those of former years, and the competition was keen.

For Chrysanthemums in pots, E. MASTERS, Esq., Beccles, again carried off chief honours for Japanese, incurved, reflexed, and Pompon varieties; also the 1st prize for a single specimen, which was a fine plant of Viviani Morel. The 2nd prizes in the above classes were awarded to Miss CROWFOOT and A. WOODS, Esq.

Cut blooms were well shown. For twenty-four Japanese varieties, open class, the Misses FOWLES, Beccles, were 1st prize winners, and in this stand was the best bloom in the show, being one of Phœbus; the 2nd prize went to N. BACON, Esq., Raveningham Hall.

E. MASTERS, Esq., was 1st for twelve Japanese varieties with very fine blooms. Incurved varieties were also well represented.

For the best miscellaneous group of plants, A. WOODS, Esq., was most successful. There was the usual display of hand-bouquets and epergnes.

Good collections of fruit came from Sir R. BEAUCHAMP, 1st prize, and N. BACON, Esq., 2nd. A very meritorious honorary collection of garden produce was exhibited by Mr. BATTERS, Gillingham Hall Gardens. *H. F.*

LEICESTER CHRYSANTHEMUM.

NOVEMBER 11, 12.—A most successful exhibition in connection with this Society was held on the above dates. There were 245 entries, and upwards of 1000 cut blooms were staged.

For eighteen incurveds, the Rev. M. BIRD was placed 1st; and Mr. J. SMITH 2nd. In the class for eighteen Japanese blooms, the positions of the same exhibitors were reversed. The Rev. M. BIRD led the way again for twelve incurveds, distinct; Mr. SHARPE, Little Dalby Hall Gardens, Melton Mowbray, being 2nd in this class. Mr. SMITH was the best exhibitor of twelve Japanese blooms, and the Rev. M. BIRD followed.

For six blooms of any variety, to be shown with foliage as grown, and with stems not less than 12 inches in length, no cups and rings being allowed, Mr. A. BELL was most successful, as he was also for three bunches of Chrysanthemums.

Table decoration was very prettily done. No flowers but Chrysanthemums were allowed, but any kind of foliage was permissible. Mr. CORNELL was placed 1st, and the Rev. M. BIRD 2nd. The amateur class for cut blooms was well contested.

There was a good display of choice fruits. The duties of the secretaryship were capably discharged by Mr. ROBERT G. LAWSON. *H. K.*

HAYES CHRYSANTHEMUM.

NOVEMBER 11.—A very successful exhibition was held in the Hayes Schools on the above date, groups of Chrysanthemums and cut flowers being alike good and of high quality.

The best group, which was composed of well-grown plants carrying fine blooms, came from Mr. Fulford, gr. to the Rev. J. GIDDING, Hayes. Mr. FULFORD was also 1st for a group of Pompons with a very pretty arrangement.

With a stand of twelve Japanese, distinct, Mr. Stenestreet, gr. to E. BRADLEY HUNT, Esq., was 1st, just beating Mr. FULFORD. The latter exhibitor was 1st for a fine and heavy stand of incurved blooms, a flower of C. H. Curtis being selected as the best incurved flower in the show. For a stand of Japanese incurved varieties Mr. FULFORD was again 1st, and from this exhibit was chosen the premier Japanese bloom, a very fine specimen of Modestum. For twelve Anemones, large-flowered, the last-mentioned exhibitor was 1st, with very fine blooms, including Descartes, John Bunyan, W. W. Astor, and Ernest Caille. Pompons were also well staged.

ULSTER HORTICULTURAL.

NOVEMBER 15, 16.—The tenth annual exhibition of the Ulster Horticultural Society was held in St. George's Market, Belfast. The show was opened by the Countess of Annesley; and the Lord Mayor of Belfast, Lord Londonderry, and other distinguished supporters of horticulture were present. The exhibition was worthy of the Society, in regard to the quality and quantity of the exhibits. The groups of foliage and flowering plants were very pleasing.

Considerable interest was manifest in a decorative table of fruit sent by Her Majesty The QUEEN, from the Royal Gardens, Windsor, to which a Gold Medal was awarded. This exhibit included Grapes from the old Vines at Cumberland Lodge and Hampton Court. Large vases of Chrysanthemums were placed in the centre of the table, and around the sides were small vases of Orchid blossoms. The exhibit was covered with a canopy in blue and gold.

Mr. HUGH DICKSON, of the Royal Nurseries, Belfast, showed a fine stand of baskets and dishes of splendidly-coloured Apples.

Messrs. ALEX. DICKSON & Sons, Newtownards, had a table of Apples and Pears, also a large show of farm produce.

Messrs. S. MCGREDY & Son, Portadown, exhibited baskets of Apples and Pears.

Quite a novel feature was the striking miniature Jardin d'hiver, designed and setup by Mr. C. MCKINNON, Curator of the Botanic Gardens, Belfast. Large Palms, Camellias, Ferns, &c., screened the walls of the building, and Cycads, Anthuriums, Aralias, and Ferns were among the plants used to form the various groups. A cascade and small lake with mossed bank much enhanced the beauty of the exhibit.

PLANTS.

In the class for a group of Chrysanthemums 12 feet by 16 feet, WM. ROBERTSON, Esq., J.P. (gr., Mr. P. McHattie), Netherleigh, Belfast, took 1st honours, with fine plants of V. Morel, Modestum, C. Davis, Val d'Andorre, each carrying from twelve to twenty blooms; the 2nd prize went to ROBERT TENNENT, Esq. (gr., Mr. J. McIlveen), Rushpark, Whitehouse.

For the best specimen Chrysanthemum plant (incurved), Mr. TENNENT was 1st, with a good plant of Baron Hirsch.

For the best Japanese specimen plant, Mr. ROBERTSON took 1st place, his variety being Colonel Smith.

J. YOUNG, Esq. (gr., Mr. T. Foster), Abbotscroft, White-abbey, was 1st for a collection of stove and greenhouse plants, which included good *Codiaeums*, *Begonias*, *Cordylines*, *Ferns*, &c., edged with *Strobilanthes Dyerianus*, and *Isolepis gracilis*; Wm. GREER, Esq., Danesfoot, Belfast, was 2nd. Some good specimen plants of *Primula sinensis*, *P. obconica*, also *Codiaeums*, were noticeable in this section.

In the nurserymen's class for a group of stove plants, Mr. HUGH DICKSON, of the Royal Nurseries, easily secured 1st place. This group was very tastefully arranged, and specially good were the specimens of *Heliconia striatum aureum*, *Dracena Burtoni*, *D. amabilis*, and *Acalypha macrophylla*. Mr. MAGEE, Knock Nursery, Strandtown, was 2nd.

Mr. HUGH DICKSON was the only competitor in the class for a group of Conifers and ornamental hardy plants.

CUT FLOWERS.

The cut blooms of Chrysanthemums, on the whole, were of good and even quality. The class for forty-eight Japanese blooms, in which six high money prizes were offered, was keenly contested, the 1st prize going to Lord ASHBROOK (gr., J. McKellar), The Castle, Durrow, who had extra good blooms of Graphic, Australia, and Madame Carnot. A. STIRLING, Esq. (gr., Mr. T. Lunt), Keir Gardens, Dunblane, Perthshire, was a close 2nd. The 3rd prize fell to Viscountess HAMBLETON (gr., Mr. Perkins), Greenlands, Henley-on-Thames. A grand bloom of Phœbus in this collection obtained the Rycroft Medal, given by Mr. H. J. Jones, for the best Japanese bloom in the show. Lord ASHBROOK was again successful in gaining 1st prize in the class for twenty-four incurved blooms. C. H. Curtis in this collection gained the Rycroft Medal as being the best incurved bloom.

FRUIT.

Apples and Pears were well shown, and the competition in the classes was keen. Lieut.-General PAKENHAM (gr., J. Harding), Langford Lodge, Crumlin, secured 1st prize for a collection of eight dishes of fruit. The Marquis of DOWN-

SHIRE (gr., T. Bradshaw), Hillsboro' Castle, Hillsboro, was placed 2nd. Grapes were of average quality, Lt.-Gen. PAKENHAM and Lady HOWARD-BURY being the chief prize-winners.

Lt.-Gen. PAKENHAM secured premier honours, and a Challenge Cup, for twenty-four dishes of Apples, distinct, Lord Derby, Warner's King, and Bramley's Seedling, were excellent; Lady HOWARD-BURY, was 2nd.

Lt.-Gen. PAKENHAM again took 1st prize for six dishes of Pears, distinct, Pitmaston Duchess and Beurré Clairgeau were the best; Lord DERAMORE (gr., Mr. W. McLaren), Belvoir Park, Belfast, was 2nd.

THE VEGETABLES

were represented by good clean specimens, especially good were Leeks, Celery, and Parsley. Lord CAREW (gr., Mr. J. McLennan), Castle Broo, Enniscorthy, took 1st prize for a collection of twelve dishes.

Farm produce in variety, Mangolds, Swedes, and Winter Cabbages, &c., were well shown.

THE SCOTTISH HORTICULTURAL ASSOCIATION held the best autumn exhibition they have ever had in the Waverley Market, November 17. Cut blooms were the feature of the show. For twenty vases of Chrysanthemums, distinct, three blooms each, Mr. T. LUNT, Keir, Dunblane, was easily 1st, with grand blooms; Mr. D. NICOLL, Rossie, 2nd; Mr. A. HAGGART, Moor Park, Ludlow, 3rd. For thirty-six blooms, distinct, Mr. T. LUNT was again successful with good blooms. A more detailed report will be given in our next issue.

BEATING FRUIT OFF THE WALNUT: *Constant Reader.*

It is supposed that thrashing the branches has the effect of increasing fruitfulness, the branches, by this rough kind of pruning, forming a larger number of fruiting-spurs than would otherwise be formed. It is an old practice, and there may be something to be said for the underlying idea. At any rate, thrashed trees bear well, so that if no good be done, neither is there any appreciable harm; we cannot, however, recommend the practice.

BEECH COCCUS: *W. B.* Yes. See letters in this week's issue.

BOOKS: *W. L. H.* *Fruit-farming for Profit*, by G. Bunyard; published by Frederick Bunyard, 29, Wick Street, Maidstone. *Farming for Pleasure and Profit, and Market Garden Husbandry*, by W. H. Ablett; published by Chapman & Hall, 11, Henrietta Street, Covent Garden, W.C.—*T. H. H.* For Ferns, get B. S. Williams & Son's *Select Ferns and Lycopods*; and for herbaceous plants, *Hardy Herbaceous and Alpine Flowers*, by W. Sutherland; published by W. Blackwood & Co., St. Martin's Street, London, W.C.

CALANTHES DECAYING: *G. S.* We can detect no cause for the decay of the roots of the Calanthes in the pseudo-bulbs sent. It is highly probable that the defect in the water mentioned by you caused the damage. Also, if the water is applied too warm it is detrimental. We would advise the removal of the tank from off the hot-water pipes, and having it thoroughly cleansed, and placed in a cooler part of the house.

CARNATIONS: *G. P., J. F.* Your leaves are affected by a brown mould, called *Helminthosporium echinulatum*. See Worthington Smith, in the *Gardeners' Chronicle*, August 21, 1886, with figure. Burn the affected plant. Sponge the leaves frequently with Gishurst Compound, which has been found useful.

CHRISTMAS SALAD: *Constant Reader.* We are unacquainted with a plant having this name, and cannot, therefore, advise you. Kindly send an entire plant for our inspection.

CHRYSANTHEMUM LEAVES: *W. L. H.* No "rust."

CŒLOGYNE SANDERIANA: *Subscriber.* You had better suspend the plant in the warm-house near the glass of the roof, and keep it supplied with water freely until growth is finished. Afterwards afford water less frequently until the flowering-time arrives.

CORRECTION: On p. 244, Apple named Enderleaf should be Onderleaf. The fruits of this variety are retained for the present. — *Botanical Magazine*, p. 352, Calliandra; for Composite, read Leguminosae.

CYPRIPEDIUM: *T. F.* Probably the plants have had too much heat at times; and probably moisture has condensed and settled on them at night; or impure air may have gained access to the house.

DENDROBIUM CLAVATUM: *Subscriber.* Give the plant a rest in a cool, dry house, affording the plant water only at long intervals, until it begins to grow again, or show flowers.

"I" or "II"; "ANA": *Anglo-Scot.* In theory, the Latin usage ought to be followed; for an explanation of this, you should refer to your Latin grammar. In practice, it is indifferent which you use, and writers are influenced by euphony, if at all. As a general rule, subject to very numerous exceptions, you will find nouns that end in a hard consonant are spelt with a single "i," nouns ending in "ius" are correctly spelt "ii" in the genitive. When the name is merely complimentary, "ana" should be used as the termination; "i" or "ii" are used—or should be used—to denote that the person named has had something to do with the plant in question—he may have discovered, or described, or figured it, or raised it; but the rule, like the preceding, is nearly as much honoured in the breach as in the observance.

INSECTS: *H. H. & Co., Gravesend.* It would be safer to pursue both of the courses you suggest, viz., to fumigate with the compound you name, and also to wash with weak insecticide.

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.

—*Geo. Wall.* The fruits resemble "Tyler's Kernel."

—*Y. M. G.* 1, Mère de Ménage; 2, Royal Russet; 3, Alfriston; 4, Braddick's Nonpareil; 5, King of the Pippins; 6, Old Nonpareil.—*W. Hurst.* 1, Warner's King; 3, Tower of Glamis; 4, Alfriston; 2, 5 and 6, not known.—*Tees.* 1, Striped Holland Pippin; 2, Beauty of Kent; 3, Pearson's Plate; 4, Lewis' Incomparable; 5, Hollandbury; 6, Non-such.—*J. C. M.* One Apple, Curlytail.—*Hortus.* Grapes, 1, Mrs. Pince's Black Muscat; 2, Alicante. Apple, Beauchampwell; Pear not recognised, bruised.—*Northleigh.* 1, Peasgood's Nonsuch; 2, New Hawthornden.—*G. S. B.* 1, Keswick Codlin; 2, Roundwinter Nonsuch; 3, Cox's Orange; 4, Ecklinville Seedling; 5, Hanwell Souring; 6, Mère de Ménage.—*R. C. W.* 1, American Mother; 2, Queen Caroline; 3, Golden Reinette; 4, Rymer; 5, Waltham Abbey Seedling; 6, Lewis' Incomparable.—*H. Fleet.* 1, Manx's Codlin; 2, Lord Grosvenor; 3, 5, 6, Cox's Orange Pippin; 4, Striped Breeing.—*A. J. G.* Pears, 1, Marie Louise d'Uccle; 2, Doyenné du Comice; 3, Duchesse d'Angoulême. Apples, 4, Lord Grosvenor; 5, Alfriston; 6, Blenheim Orange.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*A. B. S.*, Joppa. The Agarics were in such a condition that it was impossible to identify them. Possibly the yellow ones might have been some species of *Hygrophorus*. *M. C. C.*—*Standcliffe Estates Co.* *Crataegus Aronia*, native of Greece.—*H. H. & Co.* The Fern appears to be a form of *Pteris cretica*, but it is impossible to say from the dry barren frond sent. Send fresh fertile frond.—*E. W.* *Sarcanthus teretifolius*.—*J. T. B. P.* *Catasetum macrocarpum*.—*J. T. H.* We do not undertake to name florist's flowers, but your *Chrysanthemum* appears to be the old *Anemone* flowered *Fleur de Marie*.—*R. H. P.* *Eragrostis purgens*.

OLEARIA DYING: *M. & Son.* We see no insect or fungus. The plant has been pot-bound, and the appearances suggest bad drainage, or something amiss in the soil.

PEARS: *T. Basket.* The fruits are spoiled by cracking; see fig. 103 in *Gardeners' Chronicle* for Nov. 5.

PHYSIANTHUS ALBENS: *D. C.* The fruiting of this plant is not very uncommon. A figure of it, under the name of *Arauja sericifera* was given in the second volume for 1898, p. 436.

RINGING THE BRANCHES OF FRUIT TREES: *W. L. H.* The operation may be performed late in the spring, and likewise during growth if it be seen that

certain branches or shoots are taking the lead unduly. The operation affects more immediately the growth of the wood above the ring.

ROMAN HYACINTHS: *Albany.* They should be removed from the boxes in which they have been started, when relatively few roots exist on them, the operations of lifting and potting being very carefully carried out, so as not to bruise or break the roots. The soil, of a rich, light, rather sandy nature, should be passed through a $\frac{1}{4}$ -inch-meshed sieve, would then fall in between the roots, with but little pressure by hand.

ROSE-SEEDS: *J. P.* Let the haws be "stratified" in sand or sandy soil in the open air, the layers of haws being 1 inch, and the sand 2 inches thick. To prevent disturbance from any cause, the whole should be put together in a pit of suitable dimensions. If only a few haws are to be manipulated, the seeds may be rubbed out in dry sand. Sow in lines, or beds broadcast in the spring. All will not germinate the first year.

ROYAL HORTICULTURAL SOCIETY'S EXAMINATION: *A Young Gardener.* Apply to the secretary of the Society, 117, Victoria Street, Westminster.

SCHEDULE READING: *H. K.* A schedule should be read in its literal sense. In the case in point, the plants shown were required to be of distinct "species." This word should be interpreted in its botanical sense, and two specimens of *Cordylone* or *Palm* would be permissible, providing they represented distinct "species," and were not merely varieties.

SUPERPHOSPHATE OF LIME FROM BONES: *W. L. H.* Excellent as top-dressing for Apples, Pears, Quinces, Fig, Vines, in moderate amount, say $\frac{1}{2}$ lb. per square yard; applied as a dressing twice during the season, once just before growth commences, and again in June or July, it will do good. This manure is made commercially by treating the bones with sulphuric acid (white vitriol), which converts the insoluble calcium into soluble form, so that growing plants may make use of the phosphoric acid at once. The bones are first crushed or ground, and then treated with the acid. The process offers no advantages except in rapidity of making over the use of caustic alkalies, as lime and potash, the process being hastened by the use of strong stable-manure. The way to make it is to spread on a hard bottom in a pit, a layer of bones 3 to 4 inches thick, covering this with wood-ashes, or with lime, following this with a 3-inch layer of horse-dung, then another layer of bones, one of wood-ashes, or lime, and one of horse-dung, and so on to a convenient height. When the heap is finished, bore a number of holes in it, and pour in water to slake the lime and set up a strong fermentation which may last two months. When the fermentation has ceased, the bones will be found very brittle and easily pounded up fit for use. The whole should then be screened and the finer portion of it stored in a dry place.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED,

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a special large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

(For Markets and Weather, see p. x.)

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 26, 1898.

ORCHARDS IN GRASS.

A LARGE proportion of the acreage devoted to hardy fruit-culture in this country is occupied with orchard trees planted in grass, which is either cut for hay, or, more commonly, employed as pasture for sheep and other stock. That the influence of this custom has produced injurious results in numbers of places can be easily demonstrated; in fact, few districts in the southern or western counties can be visited without the combined evils of grass and neglect being deplorably apparent. The marked difference in the condition of some orchards that may be observed in the immediate neighbourhood of the neglected ones, is not invariably or entirely due to better cultivation, more suitable soil, or stronger varieties; there is another influence at work which demands more consideration than it has hitherto received, namely, the varying effects of the different grasses constituting the pasture around the tree stems.

In the course of the highly interesting and important experiments conducted at Rothamsted for some years, and reported on by Sir John Lawes, Sir Henry Gilbert, and Dr. M. T. Masters, conclusive evidence was adduced that the grasses usually employed in the formation of permanent pasture varied surprisingly, not only in their power of contending with their congeners for predominance, but also in their food requirements, and consequently in their exhaustive influence on the land.

Without attempting to go into the elaborate details of the report published in the *Philosophical Transactions of the Royal Society* (1880), a few examples drawn from the conclusions will suffice for the purpose of these notes. The sweet vernal grass, *Anthoxanthum odoratum*, has superficial roots, and in a mixture of other grasses appeared to succeed best with but little manure, yet alone it was benefited both by sulphate of ammonia and nitrate of soda. *Alopecurus pratensis*, which is deep-rooting, however, yielded the heaviest returns with liberal nitrogenous manuring, and was equally satisfactory whether that was supplied as ammonia or nitrate. *Dactylis glomerata*, which is also deep rooting, gave the best results with ammonia, and fell away when treated with nitrate. On the other hand, *Poa trivialis*, which roots freely, but near the surface, gave opposite results—namely, it was much more favourably affected by the nitrate than by the ammonia; and it is remarkable that the nearly-related *Poa pratensis* showed a notable preference for ammonia salts, and declined under the influence of nitrate. Similar varying results were obtained with other grasses, proving that the application of certain manures to mixed herbage causes the encouragement of some

species, and gradually leads to the extinction of others. Obviously, also, they exhaust the surface-soil in differing degrees, and therefore vary in the effects produced upon the roots of trees with which they may be competing for support.

Apart from their varying chemical requirements, the grasses also differ considerably in their exhausting power as regards moisture. Evidently the broad and abundant leaves of the Cocksfoot expose an enormously greater evaporating surface than the foliage of the finer Fescues or Poas. This has a double effect, first, in a dry season the surface-roots of trees are deprived of the needful supplies of moisture; and secondly, in a wet time, or in a district where the rainfall is heavy, the constant evaporation from a dense under-growth favours the production and increase of Cryptogamic vegetation which so densely clothes the stems and branches of orchard trees in many counties.

In several instances that have come under my observation, or within my experience, I have repeatedly noticed that there is a correspondence between the composition of the grasses and the condition of the trees, thus where *Dactylis glomerata* or *Holcus lanatus* with other broad-leaved strong species were most abundant, there the trees were undoubtedly in the worst state as regards stunted growth, poor foliage, and bark infestation. Where the pasture has been formed of the finer grasses with a good proportion of Clovers or other Leguminous plants, or where the ground had simply become self-sown chiefly with the *Poa annua*, very little or no injury was apparent.

It is possible, even in the latter case, that some benefit may arise from having orchard trees in grass when they have once become thoroughly established. In the early stages the presence of grass operates as a great check to the roots of the fruit-trees, and especially is this so with Apples on the surface-rooting paradise stocks, but it is seldom that dwarf trees are required in pasture because the cost of adequately protecting them from sheep or other animals would be prohibitive. Standards, as the Crab-stock, are also influenced unfavourably in their early stages, though with very vigorous growers which are a long time arriving at a fruitful state, a moderate check has a tendency to prevent excessive growth, and to promote earlier fertility. Pears are very similarly affected, but Plums and Cherries probably succeed best of all in turf, provided they are not allowed to be stunted by strong grasses immediately after planting. It is the general opinion and experience in some of the largest Plum-growing districts, that cleaner, brighter, better flavoured, and more saleable fruits are obtained from Plums in grass, than from those in cultivated land. The pasture should, even for these fruits, be formed of the best grasses, be well tended, and either grazed or cut close and frequently, and adequate manurial dressings applied if the grass be carried off the ground.

It is at the time of planting that care must be taken if permanent pasture is chosen for the orchard, and spaces 4 feet in diameter, cleared of turf and well dug, will usually suffice for the strongest standard Apples, and less will be required by smaller-growing varieties. The space must be kept clear for at least three years from the time of planting, the surface being frequently stirred in dry weather. I have found this enable the trees to become so well established that, with due attention to the matters already pointed out, the after-progress has been quite satisfactory, even with the grass

growing over the roots. It is occasionally advocated that the whole of the soil should be cultivated for several years, and then laid down to grass; but unless a regular plantation is formed with dwarf trees and bushes, or with vegetable crops between, it is not a desirable way of forming an ordinary paddock-orchard, because it is more difficult to obtain a really good pasture then. Where grass-land is scarcely sufficiently abundant for the tenant's requirements, these paddocks are found very useful; it is also a method of fruit planting which does not necessitate a large outlay at starting, or for subsequent cultivation. If, however, fruit culture is to be carried out on an extensive scale for profit, the mixed plantations and cultivated land will give far larger proportionate returns for the capital expended, though this will be ten times greater than in the former case. Still, there are advantages in planting standard Apples, Pears, and Plums in grass, but it would be worth the while of intending planters to give more attention to the composition of the grasses employed for orchards; and the seedsmen who make a specialty of seeds for pasture ought to be able to prepare a mixture that would do the least possible harm, while yielding a sufficient herbage for feeding purposes. *F.R.H.S.*

NEW OR NOTEWORTHY PLANTS.

ODONTOGLOSSUM GRANDE VAR. SANDERÆ.

THE typical *Odontoglossum grande*, having beautiful yellow flowers, barred with chestnut-brown, is a plant which is always admired when well cultivated. Considering, however, the large importations of the species at various times, it is a remarkable fact that exceedingly few show a marked deviation from the type. We have had recently that remarkable yellow form *O. grande* var. *Pittianum*, and now an importation by Messrs. F. Sander & Co., of St. Albans, reveals another quite distinct variety, which is worthy of recognition. The sepals possess two tints of yellow, viz., light lemon-yellow barred with pale Indian yellow, and exhibiting no trace of brown, as seen in the ordinary form of *O. grande*. The petals are of the same shining, light Indian yellow tint on the inner halves, and of a light lemon-yellow on the outer halves. The variation in the lip is still more marked, its white surface having in the middle area but one irregular semi-circle of yellow, instead of having the half nearest the column wholly covered with brown markings, as seen in ordinary forms. The callus on the lip is chrome-yellow, with orange-coloured markings, and the column chrome-yellow. This variety represents in *O. grande* the same sort of deviation as does *Cypripedium insigne* *Sanderæ* among varieties of *C. insigne*, which is a sufficient warrant for naming it in honour of the wife of Mr. F. Sander, who has done so much to further the interests of Orchids in our time. *James O'Brien.*

ORCHID NOTES AND GLEANINGS.

LÆLIA ANCEPS.

MANY persons complain that *Lælia anceps* is not blooming this season as usual. There is better growth in the plants but fewer spikes, both in the dark and white forms. Why this should be it is difficult to understand, for the hot, bright summer should have rendered the plants better able to produce spikes than for many a year past. It may be that it is too heavily shaded, and hence makes great growths which are not so floriferous as the smaller ones. In its home it as often as not grows on rocks, fully exposed to the sun, hence the plants should have enjoyed this summer to their utmost capacity. On rocks there is a great deal of condensation at night, owing to the cooler air coming in contact with the heated rock; this

bathes the plants in dew, in which they revel. Of course, we cannot imitate this condition in glass-houses, but we can approximate to it by not keeping the night temperature too high, to dry up that dew too soon.

I fear many of the older-named forms of *L. anceps* are now extinct, though new good varieties crop up occasionally; there are some of those named by Reichenbach in the '80s which seem to have disappeared. His herbarium is yet closed to all except the mites and the larvæ, that will doubtless render it useless by the date it is to be opened. Perhaps it is as well that it should be so in some cases, especially in *L. anceps*. Among the varieties which seem to have died out are *Calvertiana*, *Horsmaniana*, *leucosticta*, *obscura*, *Percivaliana acuta*, *radians*, *rosea* (Bull's var.), *rubra* (of the Philbrick collection).

In searching among the earliest records I find that the variety now usually termed *Barkeriana* (figured as such in *Reichenbachia*, vol. i., series 1, with sepals, petals, and lip uniformly very dark), does not conform to that figured in 1837 (*Bot. Reg.*, 1947), which was taken from Mr. Barker's plant. Its sepals and petals are much lighter in colour than the anterior lobe of the lip, and the deep colour is extended in a margin round the side lobes, and somewhat along their edge down to the base. There is no lighter area around the end of keel. The typical *L. anceps* figured in *Bot. Reg.*, 1836, plate 1751, has this white area around the keel.

Thus the distinctive marks of these *Barkeriana* are clearly not very dark sepals and petals, but a solid purple anterior lobe to the lip, and a similar-coloured margin around the side lobes.

I shall be pleased to see good forms of this popular "Winter Queen" when they open. *De B. Crawshaw, Sevenoaks.*

CATTLEYA O'BRIENIANA.

It is now nearly ten years since Messrs. F. Sander & Co., of St. Albans, first imported this handsome species, which at the time was considered somewhat of a botanical puzzle, by reason of its affinity to *C. dolosa*, together with some suggestion of *C. Loddigesii*. On being established, however, it proved to be nearest to *C. dolosa*, and the likeness to *C. Loddigesii* is almost lost. A flower sent by Joseph Broome, Esq. (gr., Mr. Axtell), from a plant grown in the bright clear air of Llandudno, represents it in fine form. The flower is 5 inches across from tip to tip of the sepals; the sepals and petals of a soft bright purplish-rose, with a shining silky-looking surface. The broadly expanded side lobes of the lip, which are folded over the fleshy column, are light rose outside, and pinkish-white inside, the disc primrose-yellow, and the broad front lobe dark rose.

ODONTOGLOSSUM TRIPUDIANS.

This species has never been such a favourite in gardens as *O. crispum* or *O. Pescatorei*, probably because it has not produced so many fine varieties as some of the other species. A good form of it, however, has many attractions. One of the best varieties we have seen is sent by Elijah Ashworth, Esq., Harefield Hall, Wimalow (gr., Mr. Holbrook). These sepals and petals are reddish-brown, with bright yellow tips; the broad fringed labellum has a spiny purple and white crest, in front of which are large rose-purple blotches. The front lobe of the lip and the narrow margins of the side lobes are white; the column white, marked with purple.

ODONTOGLOSSUM CRISTATELLUM.

A flower of a very fine variety of this rare species is sent by Elijah Ashworth, Esq. The flower, which is 3 inches across, has much the form of that of *O. polyanthum*, but in colour is nearer *O. triumphans*. The sepals are almost entirely of a light chestnut brown, the only other colour being a greenish spot at the base, and a bright yellow tip. The petals are also light chestnut brown, with a few yellow marks on each, and a yellow tip. The lip has a singular crest of many brown and white plates, and the blade is light chestnut-brown, with narrow white jagged margin. It is an attractive and uncommon-looking species, and the flowers are scented like Hawthorn. *J. O'B.*

KEW NOTES.

EUPHORBIA FOURNIERI, André; AND *E. LOPHOGONA*, Lam.—These two interesting species of *Euphorbia* have lately been introduced from Madagascar into French gardens. *E. Fournieri* was named in compliment to M. Fournier, of Marseilles, and distributed in 1895 by M. Sallier, of Neuilly, near Paris. It has an erect stem 1 foot or more high, brown and terete when old, green, five-sided, with crests of brown scaly hairs along the edges when young. The fleshy *Plumieria*-like leaves are oblong-spatulate, 5 inches by 2 inches, with a short, red-tinged petiole, the surface shining-green with grey nerves. The flowers are axillary whitish, small and unattractive. There is a figure in *Loddiges Cabinet*, t. 2477, of this plant, where it is called *E. lophogona*. This name, however, had previously been given to a quite distinct plant, so that the name *E. Fournieri* will stand good. The true *E. lophogona*, of which a figure is given in De Candolle's *Plantes Grasses*, t. 124, has also lately been introduced from Madagascar, a flowering specimen having been received at Kew from M. Godefroy Lebeuf. It resembles *E. Fournieri* in stem and leaf, except that the latter are smaller and wholly green. The flowers are, however, quite different. *E. lophogona*, having an inflorescence like that of *E. splendens*, except that the peduncle is shorter, and the bracts coloured pink. According to De Candolle, this plant was in cultivation in the Jardin des Plantes. Examples of both are now in the collection of *Euphorbias* grown in the Succulent-house at Kew. *W. W.*

DUBLIN.

"PLANTS AND INSECTS."—Under the above title, W. Moore, Esq., A.L.S., V.M.H., &c., gave a most interesting lecture before the members and friends of the Pharmaceutical Society of Ireland at their rooms, 67, Lower Mount Street, Dublin, on Monday evening, November 14. Mr. Moore prefaced his remarks by observing that the plants in their relation to insects may be looked at from at least three different points of view—

1. Insects injurious to plants; 2. Insect-trapping plants injurious to insects; 3. Insects and plants that live together to their mutual advantage.

The lecture was delivered from the third point of view, and extended over an hour and a half, being ably delivered, and beautifully illustrated by actual living examples from Glasnevin, and with lantern-slides lent by Professor T. Johnston, D Ph., of the College of Science, St. Stephen's Green.

Mr. Moore specially elucidated the question of the beneficial companionships, or symbiosis, of ants and plants, that Beccari and others have found existent in genera of Rubiaceae plants, such as *Myrmecodia*; and by Curtis in the case of a Malayan Fern. Passing in rapid review the many methods adopted by plants to attract useful insects, or to prevent the visits of certain kinds not wanted by them, the lecturer gave a lucid but all-too-short account of the contrivances resorted to by various Orchids, such as *Cattleya*, *Catasetum*, *Cypripeds*, and *Coryanthes*, in attracting insects to fertilise them. He alluded to the observations of Lehmann and other residents and collectors in South America, whose observations went to show that not only were Orchids generally fertilised by insects, but that even certain species of *Angraecum*, *Cattleya*, *Coryanthes*, *Epidendrum*, &c., were actually fertilised by one special insect only!

Robert Brown was, perhaps, one of the first botanists to point out the fact that Orchids generally were indebted to insects before they could produce seeds; and Kalm and others pointed out that humming-birds and honey-eating bats also assist in the fertilisation of Orchids and other flowers (*V. Kalm's Travels in North America*, vol. ii., p. 354).

The lecturer was listened to throughout with marked interest, not only by the authorities and students of the Pharmaceutical Society itself, but also by their numerous visitors, amongst whom was noticed Miss Webb, the young lady gardener, who was the "best man," or, Senior Wrangler, shall we say, of the Royal Horticultural Society's examination a year or so ago. *From our Dublin Correspondent.*

HARDY OPUNTIAS FOR THE ALPINE GARDEN.

THE new *Opuntias* discovered by Mr. Purpus in the mountains of the southern United States, are of great interest to the gardening world, and are especially suitable for rock-gardens. I saw them last spring in the Darmstadt Botanic Garden, near the house of Mr. Purpus, the curator of the garden, and brother of the discoverer. They were in the most flourishing state imaginable, and had stood the winter well, though this is very severe in Darmstadt. There are two excellent beds of hardy Cacti, comprising not only *Opuntias*, but *Cereus*, and *Mammillaria*. Mr. Purpus told me he had nearly forty different kinds or varieties there, all so large and sturdy as to seem growing quite naturally. Most of these Cacti came from the Grand Mesa territory, where the soil is half sedimentary, half of volcanic formation, and where the strata of the Rocky Mountains appear to have a special character.

Mr. Purpus found most of these Cacti at an elevation of between 5000 and 8500 feet; some even at an elevation of between 8000 and 9000 feet. The winter temperature there is very low, the thermometer often falling to -30° C. (-22° F.), a degree of cold unknown here. But, as with our alpine plants, the plants are protected by deep snow, and do not feel the cold. Of course, when the snow is melting and the spring coming, the nights are very cold, and often plants have to bear from 15° to 20° C. of cold. In the daytime the temperature is much higher, and the sun at these altitudes is very powerful.

The summer is exceedingly dry on these volcanic slopes, and plants must be specially constituted to withstand the drought. This explains the existence of numerous and widely-differing kinds of Cacti at such altitudes. Mr. Purpus keeps all his Cacti out-of-doors in winter, but protects them from rain and damp with a little roof, raised 2 or 3 feet above the plants. Thus kept dry they withstand the keenest frosts, and were quite luxuriant when I saw them at Darmstadt.

Mr. Purpus told me of the colours of the flowers of the *Opuntias*. Some, he said, are of the deepest orange red, and some of a light pink-carmine and rose colour. They flowered well with him at Darmstadt, and Mr. Späth, of Berlin, who bought the stock of Cacti from Mr. Purpus, was equally successful; at his nursery he has had a bed of them which has been, I am told, very brilliant.

These *Opuntias* are very interesting, and different from one another in growth and spines (which represent the leaves of the plant). Some are ornamental in aspect and spines, so that when in flower they are altogether very charming plants for rockeries.

The majority of these *Opuntias* are not yet sent out or named. Those already classified and in the trade are the following:—

O. brachyarthra, Engelmann and Bigelow.—Is a small creeping, sub-globose variety, with oval-oblong articulations, and bearing numerous tubers; spines white, and disposed in threes and fives; flowers yellowish and small. Very hardy.

O. camanchica, Engelm.—A well-known species, with large articulations and yellow spines; flowers large, sulphur-yellow. In cultivation for fifteen or sixteen years in our gardens, and quite hardy. *O. camanchica* is polymorphous and variable, judging by the numerous forms I saw, five of which at least were quite distinct. These were *O. c. albispina*, Hort., with white spines; *O. c. major*, Hort., with large articulations; *O. c. minor*, Hort., a small plant with small joints, and very spiny; *O. c. rubra*, Hort., Späth., with large and thin ovate articulations, bearing spines on the extremity only. The flower was carmine-red and brown shiny within, the stamens yellow. *O. c. salmonæa*, Hort., Späth., is like the last, but the flowers are brown, shading to yellow in the centre.

O. fragilis, Haworth.—Partially creeping plant, with small joints, large and strong spines; flowers small, yellow, with carmine stamens. It has been long known; but Mr. Purpus has introduced a hardy form.

O. humilis, D.C.—A dwarf plant, creeping over the

SARGENT

VIEW IN DR. HAMILTON RAMSAY'S GARDEN AT TORQUAY.

ground, with long and narrow articulations; spines whitish, and very numerous; flowers small and yellow.

O. Rafinesquiana, Engelm. — This plant differs from *O. vulgaris*, to which it is nearly allied in the thicker, broader, and longer articulations, which are of spatulate form, and by its solitary and large spines, from 20 to 30 mm. long. The flowers are larger, often reddish in the middle, with ten to twelve petals (*vulgaris* has eight to ten only).

O. R. var. Arkansana, Engelm., has large flowers, brownish in the middle, and the articulations are shorter and roundish.

O. rhodantha, Schumann.* — A fine species, with ovate, glaucous articulations, and long white spines; flowers large, silky, shining, and of a good carmine colour with gold-yellow stamens. It is beautiful, and the most brilliant of all the hardy Cacti, as it flowers very freely.

conditions they flower well and grow rapidly. In winter they only require to be covered over and protected against snow, rain, or damp; not against cold.

An old Cactus cultivator said to me, some years ago, that most of the non-hardy Cacti would be hardy if kept very dry in winter; and that same clever gardener kept for years, in life and good health, a *Cereus serpentinus* which he never took in during winter. *H. Correvo, Geneva.*

SAFFRON CULTIVATION IN KASHMIR.

In the *Gardeners' Chronicle* for September 25, 1897, p. 211, is an article on the cultivation of Saffron [taken from Mr. Walter R. Lawrence's *Valley of the Kashmir*. Ed.]. In this article I am sorry to observe several errors. The author appears to mistake the

be lifted at least every three or four years; even a wholesale plantation needs as much attention as an Onion-bed in the kitchen-garden, or a Hyacinth-bed in the flower-garden.

The treatment of the flowers is also strange. "The sun-dried flowers are beaten lightly with sticks, and winnowed. Then the whole mass is thrown into water, when the petals swim, and the essential parts of the flower sink; the latter are collected, and the parts which have risen to the top are dried, and again beaten with sticks, and then plunged into water. The process is repeated three times."

These various proceedings, the method of producing seeds and seed-bulbs, cultivation, and treatment of the flowers are not practiced in Kashmir nor in Europe, and I may add that they are virtually impracticable. The plans followed in Kashmir are the same as in France and Spain, and if any local variation of method occurs it is quite insignificant. The methods are well known and described in several books. The facts above given as to the methods of cultivation and the harvesting of Saffron, as practised in Kashmir, have long been known to me. Moreover, they have recently been confirmed, at my special request, by three competent authorities connected with Kashmir. One of them grew Saffron on a large scale; another is still the manager of important plantations in that country. *P. Chappellier, Paris.*

CANNAS.

THE Editor of *Indian Gardening*, the excellent representative of horticultural interests in Peninsular India, has been good enough to send us the drawing from which our illustration (fig. 110) has been taken. It affords an excellent example of that dissociation of previously mixed elements, to which we have often alluded, as one of the principal causes of sports. In the specimen figured of *Canna Parthenope*, we have on one and the same spike flowers of the yellow Austria, fig. 110, I, the yellowish-scarlet Parthenope, III, and parti-coloured flowers, II, half belonging to one variety, half to another. One side of the rachis of the spike was green, the other side reddish. The "Austria" occurred on the green side, the Parthenope on the red side of the stalk.

The flowers were thus arranged:—First pair, one pure Austria, and one-half Austria, half Parthenope; second pair, one dimidiate flower, and one pure Parthenope; third pair, one pure Austria, and one half-and-half. The leaves did not differ from those of Parthenope.

FORESTRY.

OUR WOODS AND FORESTS.

(Continued from p. 301.)

WHATEVER mistakes may have been made in the management of our Crown woodlands in the past, and whatever restrictions may be placed upon the enclosure or treatment of certain areas within them, no adequate reason exists why their future management should exhibit those features which have hitherto led to unsatisfactory results. Of course, where nothing of a definite nature has been attempted, it is, perhaps, hardly correct to say anything hitherto done in them has been a failure, but we have two standards by which they can fairly be judged, the æsthetic and the economic, and it is obvious that they come up to neither in a general way. We may find a few acres here and there which may satisfy the most fastidious taste, and we may also come across individual trees or small clumps of timber which leave little to be desired as examples of economic sylviculture. But taking the whole area devoted in some shape or form to the growth of timber, it cannot be said that our Royal forests impress us very favourably as examples of good forestry, or as types of natural and picturesque forest scenery. For this we do not blame the officials in charge altogether. As in the case of private-estate foresters, precedent and official tradition have a great deal to do with their work. "Reform" in a Government department is regarded very much as a bull regards a red rag, and the unfor-

FIG. 110.—A SPORTIVE CANNA.

I, "Austria;" II, half "Austria," half "Parthenope;" III, "Parthenope."

O. xanthostema, Schum.* is very similar to the former in colour of the flower, but has dark yellow anthers, and the fruit is spiny (quite glabrous and without spines in *O. rhodantha*).

O. x. var. elegans, Hort., has large pinkish-rose flowers, silky, shining, and a large number of petals.

O. x. var. fulgens, Hort.; the flowers are large and of a scarlet-red colour.

O. x. var. rosea, Hort., has very numerous carmine-rose flowers.

All these *Opuntias* are perfectly hardy in Darmstadt, so that they are likely to be so in England. They are all useful additions to the rock-garden. To keep them in good condition and long in flower, they must be planted in a sunny and well-drained place, so that the water never remains in the soil. The subsoil must be very deep, stony, and gravelly, so that the water can pass through very quickly. Then the plants can be watered often and abundantly, as Cacti require more than is generally believed. Under such

seed, properly so-called, for the seed-bulbs, which may be used for planting in the fields when the middle-sized corms are scarce. He then speaks of a method employed in Europe to produce these seeds and seed-bulbs. But this plan is nowhere followed in Europe or elsewhere, and for this reason. First it must be said that Saffron does not yield seed, as, even in the most exceptionally favourable years, scarcely one capsule is found on 10,000 bulbs; therefore, seed and bulbs raised from seed are not found in cultivation.

As to the corms, it has never been attempted to produce these in any special way, as the result of such an operation would be wholly insignificant. What shall I say of the method of cultivation described in the article in the following terms? "The plots where the Saffron is to be grown must remain fallow for eight years, and no manure or water given to them. When once the bulb has been placed in the square it will live on for fourteen years without any help from the cultivator." All cultivators of Saffron and all horticulturists know that the corms should

* In *Monatschrift für Kakteenkunde*, July, 1896.

tunate individual who suggests it brings down a storm of indignation upon his head, frequently without furthering his object in any way.

Then, again, there is the zealous local resident who detects in any little alteration in the mode of procedure an "attempt to destroy one of the few remaining bits of wild scenery still left us, &c.," and who invokes the aid of the daily press in calling public attention to a matter concerning which the public, as a whole, care little and know less; but the effect of which is usually to nip the proposed reform in the bud. An instance of this form of agitation occurred in connection with Epping Forest a few years ago, and although it was ultimately the means of a much needed improvement being effected, ignorance of what really constitutes picturesque scenery prompted the agitation as much as anything.

The average visitor to our public forests may be quite able to appreciate the beauty of what he sees, but he cannot be considered a fit judge of the policy adopted in the management of them, unless he takes the trouble to ascertain the principles upon which that policy rests. Should he do this, he would, we are afraid, find in many instances that no very definite policy exists, and for this, the British public has to thank itself. So long as the existence of these woodlands is passively accepted as an every-day fact, and the possibilities they present for both the present and future are ignored, they will never fulfil those functions which their character as public property requires of them. So long as sheer inactivity is the only policy approved of by a few individuals who constitute themselves the mouth-piece of the British public, we can hardly expect the authorities to invite attack by performing a duty which no one expects them to perform. But is this to go on for ever? Have those who clamour so loudly over the exclusion of cattle from 200 or 300 acres of ancient woodland any legal or logical right to dictate as to the manner in which national property shall be managed? If their æsthetic education is so far in advance of the average, how is it that they are able to view with indifference such miserable specimens of scenery as their own labours have been chiefly instrumental in bringing into existence. Surely the value of a few hundred pounds' worth of grazing is not sufficient reason for practically throwing away a valuable property, and converting it into a bare common, as will eventually be the case with a good deal of the New Forest under present conditions. Our crown woods ought to perform a double duty, and be the means of advancing both the æsthetic and economic education of the public, and by proper management they could do this far more effectually than is the case at present. But proper management is impossible until some definite plan of operations is formulated by the authorities, and adhered to throughout a lengthened period, and not altered with every change in the staff, or to suit the momentary ideas of irresponsible individuals. A short time ago a working plan for the Forest of Dean was drawn up by an official in the Indian Forest Service, and intended to serve as a guide to the surveyor of that forest during the next twenty years. So far as it goes, this working plan is no doubt a very good one, but it simply regards the area with which it deals as a timber farm, out of which as much revenue as possible is to be made, and entirely neglects the picturesque aspect of these woodlands, both actual and prospective. To sacrifice all pecuniary interests in such large areas to the picturesque, would not only be unnecessary and wasteful, but would fail to benefit the public in whose interests it might be done. But on the other hand, we think some attention ought to be paid to the improvement and preservation of those spots which arboreal vegetation and the physical features of the ground have already embellished with such success. Take, for instance, the banks of the Wye below Symond's Yat, in the High Meadow woods. At present these banks are chiefly covered with coppice which is periodically cut over, and which at any time is devoid of any attractive features beyond a dead bank of foliage. Judiciously planted with Conifers, Birch, &c., to form an ordinary woodland

growth, the scenery along this picturesque river would be greatly improved without very great pecuniary sacrifice. Dozens of similar instances could be given where judicious treatment might add immensely to the already attractive features of these woods without decreasing the area devoted, or which ought to be devoted, to the growth of timber, and yet in the working plan referred to we find them completely ignored. When so much attention has been drawn to those attractive features of the New Forest which exist at the present time, it is only reasonable to demand similar consideration for the whole of our Crown woods which are available for public pleasure resorts. If the citizens of London found it necessary to check the work carried out in Epping Forest by their own committee by appointing a body of experts to look into the question of cutting down a few stunted pollards, surely public opinion ought to be represented in any scheme devised for the future management of a forest, the possibilities of which are so varied and extensive, and which is within easy distance of several populous centres. *A. C. Forbes.*

(To be continued.)

MARKET GARDENING.

HARDY FRUITS. — THE APPLE.

(Continued from p. 234.)

Now we have to consider varieties which are best kept back till ripe, or nearly so, before putting on the market. At one time this was a very profitable class, but the introduction of fine fruit from America and Canada, and later from Tasmania, has partly spoiled the trade in them, and unless one has the advantage of sufficient airy, dry, and frost-proof storage, it will not answer commercially to attempt this plan. Even gardens of some extent and importance are but poorly furnished with fruit stores, these being, in many cases, badly constructed and fitted as regards ventilation and regulation of light. They are generally lean-to sheds, in the rear of the vineries, or, in some cases, over the bothy, or tool-house. In this case it is very difficult to bring stored fruit to its maximum of flavour, colour, and finish, and avoid a large percentage of speck and rot in the meantime.

A dry, bright day should be taken for gathering fruits, and the greatest care expended in handling it and putting it in the baskets, rejecting all magotty, bird-pecked or otherwise injured fruits, and all small and ill-shaped ones. The fruit may be left for a day or two in the baskets to get cool, and then placed on the storing-trays, which should be formed of laths or battens placed so closely together as to prevent rats and mice making their way up to the fruit. In some cases, a thin layer of clean Wheat-straw should be laid lightly across the trays, being careful not to impede ventilation.

The smooth waxy-skinned sorts, as Lord Suffield, Maux Codlin, Warner's King, &c., may have become moist and greasy (sweating, the growers call it), and if time is of little importance, it may be advisable when this phase of ripeness has arrived to wipe the fruits dry with a soft cloth, and then finally arrange them in the trays.

Such work can be done in wet weather, and it will add greatly to the appearance of the samples, while strengthening their keeping qualities.

To amateurs and growers of limited quantities, a simple contrivance patented by Mr. H. A. Orr, Bedford, is very convenient. It consists of trays, which are made to fit one in the other, and are easily lifted off when full for examination or use. Even when first gathered the selected fruits may be picked into to them, thus saving further handling. The trays, when placed one in the other after filling, are neat, and occupy but little space, while a label can be attached, with the name of the fruit and its period of ripening.

The keeping quality of varieties of Apples varies much. I have seen Gooseberry-Pippin, three years old, exhibited, though a little shrivelled; a dish of the current year, and one each of the seasons before, upon the same table. Yet sorts like Mr. Gladstone

and Lady Sudeley are best gathered and eaten from the tree—most fruit catalogues give full instructions as to this.

These periods are indicated by the swelling of the stalk (or "strig," as they say in Kent) where it is attached to the spur, and by the ease with which the fruit can be detached; but an invariable rule is, when the pips are of a full rich brown colour, the crop may be safely gathered, while the penalty for gathering too soon is shrivelling, and when too late, loss of flavour and tendency to decay. *Experience.*

FERN CRESTS.

APART from the main distinction between Ferns and flowering plants, viz., the reproduction by spores on the one hand, and by seeds on the other, Ferns have another and very striking characteristic of their own in their faculty of sporting into crested or tasselled forms. Comparing the wide range of form of fronds with the equally wide range of form of leaves, we find it possible to bring many very close parallels together, fronds and leaves aping each other in all their multiform modes of development. Despite, however, this similarity of shaping, with the single exception of that extremely Fern-like plant, *Asparagus plumosus*, which has yielded a crested variety, we know of no case where leaves proper have developed that apical distension and division which forms a tassel, though in Ferns this is so common that nearly all our native species, and many exotics, have yielded very marked examples. Normally, the fronds and their divisions end in points more or less acute, and although the divisions of a pinnate, bipinnate, or still further divided frond, are developed by repeated multiplication of the apical cells, the midrib of each division is normally simple, terminating in a point at which the cellular growth ceases, hardening into the epidermal tissue peculiar to the species. Leaves, as we have said, do this all but invariably. With crested Ferns, however, we have all grades of a secondary branching of the midribs, not on the angular plan peculiar to the species affected, which determines the arrangement of pinnae, pinnules, or pinnulets, in the plane of the frond, but in a radial fashion, which may lead to a flat, fan-like extension, or even form a corymb, as the termination of the frond and its subdivisions. This capacity displays itself erratically among otherwise normal plants by twin fronds, forked tips, and irregularly-forked pinnae, but in these cases there is no evidence to prove that the spores will yield plants similarly characterised, while there is no doubt whatever that accidental damage to the crown or axis of growth will lead to such furcation, the crippled fronds, checked in one direction, developing abnormally in another. These are, however, absolutely distinct cases from those crested Ferns which are symmetrically tasselled throughout, and which yield such typical progeny through their spores. How or why these are so affected no one knows. A solitary thoroughbred crested plant is found growing wild amid thousands of its normal fellows; the most assiduous search fails to reveal any Fern of intermediate type or any local or partial sport in its neighbours which might lead up to it by shedding affected spores. We can only assume it to be one of Nature's "jumps." Curiously enough, although in extreme cases the energy of the plant must be drawn upon very largely by the extension of growth, it does not usually, as in the case of plumose or extra leafy varieties, detract from fertility. Spores are produced in their normal abundance, and the sori extend even to the crests themselves. These spores as a rule yield the crested parental form, and it is interesting to note that so firmly is the faculty of apical division implanted in the system, that the primary fronds, the tiny firstlings produced by the prothallus, have almost invariably a clear furcation at their tips, an incipient tassel. The most cristate wild frond has so far not got beyond a tertiary crest, i.e., a tassel on the pinnule or division of the tasselled pinna borne on a frond with a tassel at its tip. By selective culture, however, cresting to the fifth degree has been reached, *A. f. f. superbum percrestatum* (D.) being five times

vided, with the fourth division radially divided. Further than this it seems impossible to go, and in considering such a development, one is struck with wonder at the systematic regularity of growth which can thus alternate the two distinct styles of cell division, the one at the normal angle of the species, which may be likened to a crystalline growth, and the other radiating at all angles from given centres, and yet in the larger crests bearing lateral sub-divisions of the other class. Although the same principles rule throughout the crested forms of all species, the results are very diverse, owing to the widely different characters of the fronds affected. The extreme forms, however, viz., those in which the frond is so divided from the outset that the flat character is wholly lost, and merged into a mossy conglomerate growth, become curiously alike, though the normal species may be utterly dissimilar. The finely-divided Lady Fern, and the strap-fronded Hart's-tongue, entirely lose their specific differences in their dwarf moss-like forms of *A. f. f. velutinum* and *A. v. densum*, Kelway. In this latter species the Hart's-tongue, beginning with mere forked tips, has varied in the cresting way until in one direction it has assumed the phase of a ramified skeleton fan, in another a heavily tasselled strap; and in another, after arriving at a solid ball of leafy ramifications covered with bulbils (*A. v. Kelwayi*), one of these bulbils sported anew, and produced a dense mossy cushion built up partly of much-divided tiny fronds and partly by a myriad tiny plantlets developed in situ from bulbils.

The mode of cresting is as diverse as are the forms it assumes. In most cases, as the frond unrolls, the tassels are seen to be already present in all their detail, and, like the petals of a Rose or the wings of a butterfly, only need expansion to be perfect. In other cases, however, the opening frond displays but little evidence of cresting, a tiny forking alone giving promise of later development. Presently, however, as the frond expands, this little beginning will fork and fork again and again until a handsome tassel is produced, the growth in such cases often continuing until the growing season is over. In *Pteris serrulata* var. *Applebyana* the fronds perfect normally though slenderly, a slight woolliness at their tips alone indicating growth, these tips then split dichotomously, into hundreds of slender strands, and form even a secondary growth the following season.

That cristation is a transmissible character by crossing has been abundantly proved, and the particular type of tassel being truly imparted, is good evidence of the cross. Mr. Schneider has even succeeded in imparting the crest of our *Polypodium vulgare* var. *cristatum* to two exotic *Polypodies* (see figs. on p. 362 and p. 363 in our last issue); and Mr. Clapham managed to impart the tassel of *P. v. bifido-cristatum* to that finely cut variety known as *P. v. elegantissimum*, in which direction much remains to be done.

The curious exception above cited of *Asparagus cristatus*, merits a further word or two. The great similarity of the leaves of this plant to the fronds of a Fern, has led to its being popularly called the *Asparagus Fern*; and the fact that it has sported into a truly crested variety with bunch tassels at top and sides, points to some correlation between cresting and cutting of this typical form which might repay investigation. *Chas. T. Drury, F.L.S., V.M.H.*

FASCIATION.

STEM-FASCIATION, as is well known, means that particular ribbon-like and plane enlargement of parts of the stem and branches with which most interesting abnormalities in leaf arrangement are often connected.

About a month ago I came into possession of four interesting specimens of fasciation of *Oxalis crenata*, one of which is especially striking for its very distinct ribbon-like and plane enlargement. They were found among other normal specimens which were grown in the garden of the Government Horticultural School at Wageningen, Holland, and I believe that hitherto only one instance of fasciation of *Oxalis crenata* has been described, namely, by Mr. François Crépin, in the *Recueil de faits tératologiques II.* (*Bull. de la Société Royale de Botanique de Belgique*, t. iv., 1865.)

The specimens were cut off just above the ground, that is, a little above the neck of the root; and immediately above the cut every specimen showed the ribbon-like enlargement, which however obtained the greatest degree of development after the first ramification.

In addition, quite normal branches were also found on each of the specimens, differing in absolutely nothing from the normal form, as shown in the photograph. One of the specimens measured nearly 6 inches across its greatest development; this, I believe, is neither surpassed nor equalled.

I intend giving a full description of the alterations and anatomical differences caused by the enlargement of the stem, and its ramifications in the distribution of the fibro-vascular bundles. Can the enlargement of the stem have been caused by the influence exerted by some species of bacterium during the plant's growth? May this hypothesis become a starting-point for further researches and investigations? *Dr. J. Th. Cattie, Director, Wageningen, Holland, Nov. 3, 1898.*

[The condition is so common in strong-growing plants that we have not thought it necessary to reproduce the illustrations which Dr. Cattie has been obliging enough to send.]

Some plants are more subject to it than others, and in some cases, as in the Coxcomb, the Teasel, *Sedum monstrosum*, &c., &c., the condition has become more or less fixed and hereditary. It is not clearly ascertained whether the peculiarity is due to the subdivision of one original growing point, or whether there are from the very beginning several growing points which do not separate one from the other, but remain in union and constitute a flat or often a spirally-twisted band.

Mr. Frank Webber, of the Tonbridge Nurseries, sends us a photograph of one of the largest examples we have seen. The plant in this case (a Vegetable-Marrow) was 28 feet long. About a foot from the root the stem began to flatten, and then gradually widened till at the top it measured 12 inches across.]

PLANT NOTES.

ALOCASIA SANDERIANA.

THIS handsome Aroid is well worthy of a place among choice stove-house decorative plants. It is of compact habit, somewhat smaller than most *Alocasias* of this type, but for richness of foliage it is surpassed by none. The dark, lustrous green leaves are barred and edged with silvery bands, the back of the leaf is coloured deep claret. They measure about 6 inches in width by a foot in length, the leaves of very old plants becoming much longer, but do not widen in proportion. The plants grow best in such a compost as would be afforded *Cattleyas* in pots, giving plenty of drainage, using comparatively small pots with holes made in the sides for the admission of air, following up the stem as it grows with rough pieces of peat loosely tied around it. The plant refuses to root into a close compost, generally resulting in the decay of the tender rootstock. I have tried to "set" seeds of a large number of flowers, but have not succeeded. *A. Sanderiana* may be propagated, however, by division of the rootstock or by small tubers, which it produces freely; these should be left on the parent plant till they have formed independent roots and leaves. I have not succeeded in getting a single one to grow when cut off in a dormant state. It is a native of the Philippines.

TYDÆAS.

These useful stove-house plants have now become exceedingly popular, and judging from the improvements made of late in the forms and coloration of the flowers of new *Tydæas*, they have a future before them such as the *Gloxinia* and *Streptocarpus* now occupy. A large and very varied lot of beautiful named varieties are offered by nurserymen specialising Gesneraceous plants, at prices which place them within the reach of all. With a few of these to start with, or with a packet of seed obtained from a good source, it is possible, by careful hybridisation, to secure a very varied lot of *Tydæas*, that would prove

very useful for stove-house decoration at all times of the year. There is but little trouble in setting seeds; a single plant in good health will produce seed sufficient to raise many hundreds of plants. The plants require a temperature of not less than 60° to keep them up to their proper standard of merit; if grown in low temperatures, even the best varieties degenerate to a worthless degree. They may be used for conservatory decoration during the summer months, but the flowers that open there are not so good as those that opened in moist stove-house temperature. A compost of rich loam with one-half its bulk of leaf-mould, with a dash of silver-sand, suits the plants well. Give them plenty of water whilst growing, with an occasional application of some concentrated manure, keeping the plants drier as they go to rest, placing them in a cool place where they may be watered occasionally, to prevent the scaly rhizomes shrivelling. I send for the Editor's inspection some hybrid varieties, raised at Isleworth by crossing plants produced from seed acquired several years ago. *Geo. B. Mallett.*

RHUS TOXICODENDRON.

This is the finest plant we have here for autumn-tinted foliage, and it has been a beautiful object this autumn, although many plants did not colour so well as usual. Is there any well-authenticated record of its poisonous properties, or is it all a myth? [No]. An old man, who has pruned and trained the plant for more than thirty years, tells me he has never suffered any ill-effects from handling it, and did not know it was poisonous; perhaps it is necessary to take it internally, but I think I have read somewhere of the poison being communicated through the skin. *W. H. Divers.* [The utmost caution is necessary in handling this plant, though some people do not suffer from it. *Ed.*]

FLOWER-GROWING IN ENGLAND.

THERE is no doubt that flower-growing is greatly extending in this country, and that competition among home growers is becoming more and more severe. Foreign supplies of flowers have increased, but not nearly so greatly in proportion as home supplies; and it seems clear that home-growers have gained ground in relation to their foreign rivals, except with respect to flowers for the growth of which foreigners have extraordinary natural advantages. It has already been intimated that there is a danger of the culture of the *Narcissus* being too much expanded; also that the *Chrysanthemum* is produced in excess of the demand. Again, in the production of Violets, the warm and sunny South of France has an advantage not possessed by this country, while Holland maintains her hold upon the Hyacinth and Tulip trade for a similar reason. But whether the production of flowers as a whole is gaining ground upon the consumption or not, it is difficult to determine. It is true that the prices of flowers have fallen generally, as those of nearly all other commodities have; but production, at any rate under glass, has been cheapened, and if a fair profit can be obtained, the fall in prices, without which the existing consumption of flowers would be impossible, does not necessarily imply over-production. There is some difference of opinion among growers upon this point; but nearly all agree in stating that profits are now so small, that production on a large scale is necessary to provide a decent income. Mr. George Moore, of Covent Garden, who is certainly one of the best authorities, is of opinion that supplies of cut flowers are "pretty nearly overdone," as indicated by the great glut that occurred in the summer of 1897. Prices, he says, are much lower than they used to be and only the best growers do well.

Thus, in flower-growing, as in nearly every other career, inquiry leads to the conclusion that "there is plenty of room at the top." In this industry, moreover, there is such a very wide scope for the exercise of superior skill, industry, and alertness, that it is not surprising to find some who are engaged in it doing remarkably well to all appearance, while others are struggling on and hardly paying their way

That a man with only a little capital, starting in a small way, has many disadvantages is certain; also that his chance of saving money and extending his business quickly is much less than it was a few years ago, but energy and superior capacity enable many such men to overcome all difficulties and attain success.

To the casual looker-on, who knows nothing of the drudgery of the industry, flower-growing seems a delightful method of getting a living. That it is an entrancing pursuit there is no doubt; but it is equally true that it is a very arduous one, requiring the most careful forethought, ceaseless attention, and abundant energy. Fortunately for those who might be tempted, without any knowledge of it, to embark capital in it, flower-growing, if at all comprehensive in scope, so obviously requires a varied and extensive technical knowledge, that any one can see that a thorough training is necessary to a man who intends to adopt it as a business, especially if hothouse flowers are to be produced. *William E. Bear, 70, Onslow Gardens, Highgate. (Extract from Journ. Royal Agric. Soc.)*

FRUIT REGISTER.

PEAR BEURRÉ D'ANJOU.

THE flavour of this Pear is very delicious from trees grown on chalky soils, although the fruit is not so very large. It is of handsome shape, and fine colour. In East Kent the fruits ripen early in October, and they keep sound for a longer period than some other varieties which begin to ripen at about the same season. I consider Beurré d'Anjou well deserving of rank amongst our best October Pears.

PLUM BLUE IMPERATRICE.

I have this Plum bearing very freely on a south wall. The fruit is of a medium-size, firm, and of very passable flavour, and it keeps in fine condition when left on the trees till late in the season, only it must be netted so that the birds are unable to get at it.

WYEDALE PLUM.

As a late variety, this Plum will be found very useful as a cooker. It hangs in ordinary seasons till late in October and the early part of November. The fruits carry a very heavy bloom, and the trees bear freely in most seasons.

KIRKE'S BLACK PLUM.

When grown on a wall, as here, the flavour of this variety is, perhaps, one of the best of any black Plum that is grown, and it has few equals as a dessert fruit. The variety is a free cropper on the chalk, and the fruits attain a fair size. *H. Markham, Northdown Margate.*

TREES AND SHRUBS.

THE TUPELO, OR SOUR GUM (*NYSSA SYLVATICA*).

SOME American trees, which in their own country we read of as amongst the most striking of those that make the autumnal glory of the American woods, do not always maintain their reputation in this climate. Of these, the Tupelo, happily, is not one. I have not been fortunate enough to see it in its native state, where it is, according to Sargent, one of the most distinct and picturesque of North-east American trees, sometimes 100 feet high, the leaves dying off in autumn a bright scarlet. But even here, during the last few weeks, it has certainly been one of the most beautifully coloured of all hardy trees and shrubs. The leaves are narrowly obovate, and about 5 inches long; in summer they are firm in texture, and dark-green, but latterly of a clear, glowing orange colour, verging into scarlet. The tree is widely spread over the eastern United States, and is often to be seen on the borders of swamps, growing in wet, undrained soil; but Sargent says it is on high and, of course, drier wooded slopes in the Alleghany region

that it attains its largest size. Here in Britain, under duller skies, it ought, I should say, to be planted in deep and moist, but certainly well-drained soil. It would be interesting to know if there are any large specimens of the tree in this country. There ought to be, for it is known to have been in cultivation near London close on 150 years ago.

ST. DABEOC'S HEATH (*DABEOCIA POLIFOLIA*).

For a plant to have been in flower in June, and to be still in flower in early November, is a strong recommendation, especially when it is as charming a shrub as St. Dabeoc's Heath. And it is not merely bearing a few straggling blossoms, its crowd of spikes make a really bright and (at this season) even striking display. This, of course, is largely owing to the open and often sunny weather experienced during October, but whatever the season may be, this little shrub is always attractive during the latter half of summer and autumn. Its pitcher-shaped flowers are of a bright purple in the type, but there is also a variety with pure white flowers (now the fullest in flower), and another which has them both white and purple, the two colours often occurring in the same flower. The species is a native of the extreme west of Europe, including the west of Ireland, where originated the popular name of St. Dabeoc's Heath. Some objection has been made lately to the transposition of the vowels "o" and "e" in the scientific name, but authors have frequently availed themselves of a similar "botanical license." Not many of us, perhaps, would associate "Stranvæsia" with a gentleman named Strangways.

ALPAPAPPUS ERICOIDES.

We have lately had in flower a small plant of this curious shrubby Composite. It has already been figured in these columns (see *Gardeners' Chronicle*, September 12, 1896, p. 301), from a plant in Mr. Gumbleton's garden at Belgrove, near Cork. It has also succeeded well in the south of England, Major Gaisford having had bushes 4 feet or more high. It is, perhaps, questionable whether it will be hardy near London; but even if it is not, it certainly ought to be grown in the warmer parts of these Islands, as much for its beauty as its interest. As the specific name implies, its leaves suggest those of a heath; they are crowded in fascicles all up the branches, and are from $\frac{1}{2}$ to $\frac{3}{4}$ inch long. The flower-heads appear during the autumn months on short shoots, which are mostly crowded at the end of the branches, where they form a cone-shaped inflorescence. The ray-florets number three or four to each flower, and are bright yellow; the disc-florets are also yellow, the whole flower-head being $\frac{1}{2}$ inch or so across. The species appears to be fairly common near San Francisco in California, also on the dry hills near Santa Barbara in the same State. *W. J. B.*

LÆLIO - CATTLEYA × HENRY GREENWOOD (L.-C. × SCHILLERIANA × C. × HARDYANA).

THIS is a garden hybrid of remarkable beauty and interest, the plant having, so far as has yet been proved, the property of flowering at two seasons, viz., spring and autumn. The hybrid is of extraordinary interest as being the outcome of a cross between two natural hybrids, viz., C. × Hardyana (*Warscewiczii* × *aurea*) and L.-C. × Schilleriana (C. *intermedia* × L. *purpurata*), the parentage of which has also been verified in each case by seedlings raised in this country from artificial crossing.

L.-C. × Henry Greenwood, the subject of our illustration (fig. 111), was raised by M. Chas. Maron, of Brunoy, Seine-et-Oise, France, who first exhibited the plant at the Ghent Quinquennial Show this year, and obtained the 1st prize as the best new garden hybrid Orchid, and also a special Silver-gilt Medal. The plant became the property of Henry Greenwood, Esq., Highfield, Haslingden (gr., Mr. Gill), who exhibited it at the meeting of the Royal Horticultural Society on October 25 last.

The sepals and petals are white, tinged and veined with bright, light rose, and the lip blush-white at

the base, the disc clear chrome-yellow, and the front lobe and tips of the side-lobes rich crimson-purple shading to rose towards the margin. The flowers are fragrant. A similar plant was shown by Messrs. B. S. Williams & Son, of Holloway, at the Royal Horticultural Society's meeting on the 11th of last month, the exhibitors receiving an Award of Merit for it. The inflorescence in each case bore three flowers.

THE HERBACEOUS BORDER.

ASTER TRADESCANTI.

THIS old variety, which is one of the latest of the Starworts to flower, has done remarkably well this season, and some plants are still in full beauty, its small starry, white flowers with a yellow disc, combined with its handsome foliage, making it an attractive object in the borders at the present time. The past few weeks have been favourable to the development of the plant. Even when not in flower, the growths are useful for associating with other of the earlier-flowering Michaelmas Daisies, and even in seasons of early frost it is a useful plant for this purpose. *C. Herrin, Droghmore.*

FOREIGN CORRESPONDENCE.

THE TREATMENT OF NEWLY-IMPORTED PLANTS.

IF Cactus plants arrive between April and September, I clean them very thoroughly, removing all broken or rotten roots, put them at once in a mixture of ashes, sand, and a little mould, and keep them for a few days (ten) quite dry, and in a little shade. After ten days a small quantity of water is given them overhead during sunshine.

After the lapse of a month, I keep the materials slightly moist, and do not remove the plants for three months. I then take out every plant and pot it. If any of them are still without roots, I put them again into the same bed, and keep them therein until roots form, which sometimes does not occur for two years. If the plants arrive in the period from October to March, I treat them in the same way, with the exception that I do not put mould in the mixture at all, and do not water the plants overhead, and only wet them a little after the plants have been one month therein. I do not expect to find any roots before May, when I pot them and treat them as I said before. I do the same with all Cacti without exception.

Now if plants arrive partly rotten, I cut out the rotten parts; and if in winter or in wet weather, I dry them before a fire after having well rubbed the wound with a piece of wool. In summer I dry the wounds in the sun, and when all is well dried, I lay the plants with the wounds upwards for from ten to twenty days, and when the parts appear to be healed, I put them on to broken ashes, moisten them overhead just a little, and so on as with sound plants. Still, many plants are lost, but if the loss is not greater than 10 per cent., you may be glad, for the result is very good. *Franz De Laet, Contich, Belgium.*

FORESTRY DEMONSTRATIONS.

ONE of the first plans of usefulness emanating from the Division of Forestry at Washington since Mr. Pinchott has succeeded Dr. Fernow, is that set forth in Circular No. 21, under the title of "Practical assistance to Farmers, Lumbermen, and Others in Handling Forest Lands." The proposition, as it affects farmers, is one of local forestry demonstrations under the management of the Government foresters. A farmer who has a good wood lot, which he would like to manage to the greatest advantage, applies to the Agricultural Department for help. With the usual amount of Government red-tape, the department foresters prepare a working plan, providing for the renewals, improvements, and cuttings in the specified woodland. This work is carried out by the farmer at his own expense, but under the management and with the constant advice of the Government

foresters. The plan seems fit to work in certain cases, and a few such demonstrations scattered through the country may be expected to do a great deal of good.

"THE EVOLUTION OF OUR NATIVE FRUITS."

This new book, by Professor L. H. Bailey, is just off the press. It is not too early to say (especially as this is only a private opinion) that it is the best book which Professor Bailey has yet produced. Perhaps everybody else will not think so, and it is hardly probable that the book-buying public will endorse

into any of its precursors, and it all shows in the result. And the result is eminently satisfactory. *F. A. Waugh, U.S.A.*

THE APPLE CROP.

The report of the *American Agriculturist*, which is one of our most reliable sources of information, estimates the entire commercial Apple-crop in the United States, for 1898, at 27,681,000 barrels, against 41,536,000 in 1897, and 69,879,000 in the year 1896. This presents a remarkable shortage. It is the smallest crop known for many years—in fact, since there has been a commercial Apple-industry in

scarcity will give the American fruit-grower a good opportunity to recover from the misgivings left in his mind by the over-production of 1896.

CULTURAL MEMORANDA.

CALCEOLARIA AMPLEXICAULIS.

My motive in penning this addition to Mr. Molyneux's remarks, that appeared on p. 292, October 15, is to say that it can be propagated quite freely in spring as well as autumn. In some places autumn

FIG. 111.—LÆLIO-CATTELEYA × HENRY GREENWOOD. (SEE P. 382.)

this opinion with their purchases. Book-buyers and book-critics never agree anyway, and the sale of a book is by no means an exact guide to its worth. This book really gives an account of the horticultural development of those numerous fruits which are native to the continent of North America. It tells about their present status, and gives some notes of the work which has been spent in their amelioration. Of course, it reviews most critically the botany of the species concerned, and makes many emphatic contributions to botanical classification, especially in the genus *Rubus*, which has been given a surprising shaking-up. More time, energy, research, and love of the subject have gone into this book probably than

America. Many people in this country will this year be obliged to do without their usual Apple supply. The quality is also below the average, taking the whole crop together, though the best Apples are being naturally put on the market. Michigan is the only Apple-growing State which has anything like a full crop. Nova Scotia has done better than any section of the States, with the possible exception of Michigan. The estimated surplus in Nova Scotia for this year is 250,000 to 300,000 barrels, compared with 85,000 last year, and 500,000 in 1896. These Apples nearly all go to England. The New England crop is fairly good, especially in certain parts of New Hampshire and Vermont. But these two years of

cuttings are not produced at all freely. This is often the case where the soil is of a very light, sandy, or chalky nature. Last spring twelve months I potted up about a dozen of the strongest of the previous autumn-inserted cuttings, my object in doing this was to try and flower them in pots with a view of getting seed from them. I thought that if this were possible, I could reproduce them freely from seed. I did not succeed in getting seed to ripen. The plants were stored in a cool Peach-house last winter without cutting them down. An abundance of young growths was produced in the spring, and being short of autumn-rooted plants, I inserted a quantity of these soft cuttings in pots, and

put them in a propagating-case, where they rooted as freely as *Lobelias*. I frequently use this *Calceolaria* as a sort of "dot" plant amongst beds of *Calceolaria Golden Gem*, and the two shades of yellow harmonise very nicely; besides, the taller growing one breaks up the more level surface of the dwarfer kind. *H. J. C., Grimston, Tadcaster.*

VERBENA VENOSA.

Where many of these plants are required for filling the summer beds, it is a good plan to take up a quantity of the roots and lay them in thickly in cutting-boxes, cover them with sandy soil, and place the boxes in a cold pit, into which frost cannot enter. Here, with an occasional moistening of the soil, they may be left till the middle of the month of February, and be then placed in a started vinery or other forcing-house. In a short time shoots will grow, and these may be pulled off below the soil, and dibbled into prepared boxes 3 or 4 inches apart, and kept in heat till roots form. They may be planted direct from the boxes without any further preparation, except that of hardening them off. Although the plant can be readily raised from seed, cuttings make an earlier display. *H. Markham.*

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Camellias.—Any of these plants which may be growing on the back walls of early vineries will be yielding quantities of flowers very acceptable at this season, when flowers in any variety are somewhat scarce. *Camellias*, either early-flowering or late, should not at any time suffer lack of moisture in the soil, although less is wanted now than at the growing season. Cool treatment should be afforded all of the plants which are intended to flower in the spring, affording them plenty of air whenever there is no danger from frost, and using but little artificial heat at any time.

Freesias.—The earliest batch of these bulbs will now be showing flower, and should be kept near the glass in the intermediate-house. Manure-water may be afforded the plants frequently. Successions should be kept growing steadily on a shelf close to the glass, or in a low pit, affording them weak manure-water when the roots have filled the pots.

Primulas.—Should the early plants be backward in showing flower, place them on a shelf near the glass in an intermediate-house. Later successions will succeed in cold pits with heat at command till the flowers appear, when removal to the greenhouse will be advisable. Do not crowd the plants, but allow each space to extend its foliage, as crowding causes weak growth, destroying the beauty of the plant. As most of the plants will have filled their pots with roots, weak manure-water at alternate applications of water will assist them. Air should be afforded freely whenever the weather makes it safe to do this.

Indian Azaleas.—In order to have some of these plants in flower at the Christmas season, select those with forward buds, and place them in the forcing-house, affording enough water to meet the requirements of the plants, but not so much as would induce a too-early growth of shoots. Let the plants be freed from Thrips and other noxious insects before placing them in the forcing-pit. Ply the syringe lightly over the foliage twice a day. The white-flowered variety, *Deutsche Perle*, is a good one for forcing at this season.

General Work in the stove consists chiefly at this season in arranging the plants in such positions as best to meet their requirements, and in avoiding overcrowding them. On dull days damp thoroughly amongst the pots, but avoid using the syringe on the plants, as the soil is then liable to receive more moisture than is good for the plants. The application of water must be carefully made, and ventilation afforded whenever the outside temperature renders it safe to do so, closing the ventilators early in the afternoon. The night temperature should range from 60° to 65°, according as the weather is frosty or mild. If pernicious insects are present on any of the inmates, at once take measures to exterminate them by sponging and syringing with an insecticide, or even with hot water at a temperature of 140°, which is excellent for scale insects of all kinds.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford, Kent.

Hardy Azaleas.—It is a matter for wonder that the hardy *Azaleas rustica*, *pontifica*, *mollis*, and the Ghent varieties, with their beautiful flowers and often their nice fragrance, should not be more extensively used for the beautifying portion of the garden in the months of May and June, and again in autumn, with their fine leaf-tints. They might be planted with other shrubs, or in beds by themselves; and the present affords a suitable time to plant. The plants being possessed of very fine roots, a mixture of peat and leaf-soil mixed with much road-grit or clean sand should be employed where the natural soil is not peaty, mixing this with the latter, or employing it alone. They will succeed, however, without the peat, providing a plentiful supply of leaf-soil is available, and the staple consists of light loam. *Azaleas* make, if they are given sufficient space, flat-headed bushes 4 to 6 feet across, therefore the plants may be set out at 3 feet asunder; although transplantation should be performed before they get spoiled.

Rhododendrons.—There is a mistaken idea, and one which prevents the *Rhododendron* finding a place in many gardens with a suitable soil, that peat is essential for healthy growth, and that without it, it is useless to attempt their cultivation. The truth is, the plants will succeed in any friable kind of soil not containing lime if leaf-mould be incorporated with it. *Rhododendrons* should have beds to themselves, apart from large-growing kinds of shrubs; and they are not injured by the shade of trees, provided it be not very dense.

Pernettya mucronata.—Berry-bearing plants have a fascination for many persons in the winter months, when flowers naturally are few; and among the many berry-bearing shrubs we possess, *Pernettyas* hold a high place. There are numerous varieties, with berries of different tints, and being of dwarf habits, they make excellent rock plants, edgings for beds of *Azaleas*, *Rhododendron*, *Kalmias*, &c., or as subjects for covering banks, and filling small beds. They require a similar kind of soil to the foregoing.

Ericas.—*Hardy Heath*s. —A collection of these plants, blooming as they do nearly the whole year, is always of interest. Being essentially peat-loving plants, they should be planted in peat, or in a friable fibrous loam, having sharp sand, grit, and leaf-mould added to it. *Ericas* grow equally well in partial shade or full sunshine, as do the Irish *Heaths*, *Dabeocia polifolia*.

General Remarks.—The birch-broom and the lawn-roller must be kept pretty frequently plied in order to maintain a smooth surface to the lawn and the walks, if the latter consist of binding gravel. If the grass continues to grow, mowing must still be practised, taking care not to mow when the grass is covered with hoar-frost. Outdoor *Chrysanthemums* will need cutting-over as they pass out of flower, those which it is desired to increase being marked with a label. The replanting of *Roses*, and any deciduous shrubs, should be hastened while the weather is open; and the mulching of creepers on walls or trellises, or other permanent subjects requiring it, should be done as time permits. Bulb-planting should be finished, or the results will be very unsatisfactory. *Anemone* tubers may be planted for a succession.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Pear-trees.—As soon as the pruning of bush-fruits is finished, that of the wall-Pears may begin, and be followed by nailing or tying, all the work of this nature being done wherever possible before the advent of hard weather. Assuming the young growths were summer-pruned, these will now require to be cut back to within an inch of their base; and most of the spurs which have got far from the wall should be cut back to a bud, or removed entirely where they can be sacrificed. Some varieties naturally fruit on long spurs, notably *Marie Louise*, and this peculiarity must be borne in mind in pruning. Three inches from the wall is far enough for others, at that distance the flowers and fruit are afforded protection against frost. In the case of the long-spurred varieties, boards, either with or without netting, should be fixed under the coping as a kind of protection against frost and hail. When the *Pear* is fan-trained, all terminal shoots, if not more than 12 inches long, should be laid in unshortened, except the terminal bud, which

should be nipped out; for if it be a bloom-bud, as is usually the case, onward growth is arrested for a year if it be left. Fine tarred-twine forms the best material for securing the main branches of a *Pear-tree*, and where the walls are not wired, nails or round-headed studs should be driven into the wall, and the branches fastened to these. It is very necessary in the case of the *Pear* to remove most of the fastenings annually.

The Pruning of Espalier Trees should be carried out on the same principles. These trees being less tall than trees on walls, are less easily balanced as regards the distribution of sap, with the consequence that the upper tiers of branches become the strongest after a few years, and for this reason old trees are usually unsightly, although good fruits are borne on the more robust branches. Something may be done in summer by checking the growth of laterals on the upper branches, and in keeping the spurs thin, at the same time allowing growth to a fuller extent to be made on the lower ones. Root-pruning, in some cases of great vigour, aids in restoring a balance between the upper and lower tiers. The old plan of supporting these trees on wooden stakes has almost disappeared, stout iron-wire trellises having taken their place.

Pyramids and Bush-trees.—In most kitchen-gardens these must be restricted to 8 or 10 feet in height, in order that little shading of the vegetable crops ensue, it being only in very large gardens that full-sized standard trees can be grown. As much pruning leads to unproductiveness, a better method is to let the leading branches grow unpruned for two or three years, merely thinning out the weakest growths and those in the centre. By doing this, heavy crops of fruit are obtained, but the fruits are smaller than what can be obtained from trees moderately pruned.

Root-pruning.—If the space is too limited for this kind of extension of growth, the better alternative is to root-prune, which will tend to induce the formation of new fruit-spurs, and reduce too great luxuriance. The trees which are making the strongest growth may be lifted entirely, and weaker ones have half of the roots lifted in one year, and the other half the next year. To do this readily a trench should be taken out at the extremities of the roots as deep as the lowest roots, and 2 feet wide, then the soil should be removed by a fork until the roots are cleared, then these should be tied together and fastened to a stake, whilst the work is carried further. Roots that strike downwards may be cut off, after digging a portion of them out of the soil, all jagged ends being made smooth, so that roots may start from a healthy callus. When filling in the soil, the roots should be kept in their natural positions by laying down horizontally the lowest first, then, after covering these with soil and making it firm, another layer of roots should follow, and so on till all are replaced. If the soil is wet, or is of a kind liable to run together, some charred soil or refuse should be mixed with it, and instead of treading, it should be pressed with the spade and left to settle. A mulch of half-decayed manure may be put over the roots. Trees in exposed positions will need securing against wind-waving, which is best done by fixing a piece of india-rubber hose-pipe around the stem, at two-thirds of the height, and fastening three galvanised guy-wires triangular-wise around it, securing these to 3-foot stakes, driven 2 feet into the soil.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence Bart., Burford, Dorset.

Uncommon Hothouse Species.—Most Orchid collections contain representatives of the species and hybrids of *Cattleya*, *Odontoglossum*, *Dendrobium*, *Cypripedium*, *Calanthe*, *Cologyne*, *Phalaenopsis*, *Mittonia*, *Sophranites*, &c., that produce showy flowers. But there are numbers of other species which are very pretty, and singularly attractive. Few plants excite so much interest as the feather-like lip of the *Bulbophyllum barbigerrum*, or the extraordinary sensitive labellum of *Madevallia muscosa*, which upon the slightest touch suddenly closes itself upwards to the column, where it remains for some little time before ascending again to its proper position. Very singular too, is the movable lip of such plants as *Bulbophyllum Lobbi*, *B. Dearei*, *B. siamense*, and *B. Sillemianum*. The labellum in these cases is so constructed, that following very slight motion, it is thrown backward and forward as though it were set upon a hinge. There are other *Bulbophyllums* of equal merit, as *B. grandiflorum*, *B. Sanderianum*, *B. longisepalum*, *B. comosum*, *B. umbellatum*, *B. may*

dibulare, B. tremulum, B. nigropetalum, B. Ericsoni, B. racemosum, B. Dayanum, &c. There are many varieties among the Cirrhopetalums which are not only curious, but handsome in appearance. Such is the umbrella-like spread of the brown satiny sepals of C. Mastersianum, C. ornatissimum, the distinct C. Rothschildianum, C. Colletti, C. O'Brienianum, C. Thouarsii, C. robustum, C. guttatum, C. appendiculatum, C. fimbriatum, C. setiferum, C. Cummingi, with flowers arranged like tiny pink parasols, and, when stood upon the ground each flower looks as if a caterpillar were curled over its surface. A compact plant of C. nutans, smothered with umbels of small white flowers, makes a charming object. C. refractum is also a great curiosity, as whenever the plant is handled, the flowers move about in wind-mill-like fashion. C. Medusæ always attracts attention, the aspect presented by the dense cluster of numerous flowers, and the lateral sepals being so much lengthened as to give the spike the appearance of a head with very long dishevelled hair. Eria disciflora, with its movable tongue-like lip, is another extraordinary species. Eria anchorites is very appropriately named, from the anchor-like resemblance upon the lip. The strong-growing Megacalinium triste produces an erect spike, the rhachis at its apex having the appearance of a snake in the act of striking, on each side of which are borne small blackish flowers in alternate pairs. M. leucorachis is also a peculiar and interesting species. All the above plants will thrive if suspended close to the roof-glass in the warmest house or ordinary plant-stove; but if any plant shows signs of ill-health, remove it to the intermediate-house. Keep the plants always on the shady side of the house, as they resent direct sunshine, but love light. They should be planted in teakwood-baskets or shallow pans, filled to about three-fourths of their depth with clean crocks or charcoal. The advantage of charcoal over crocks consists in its lightness. Place a layer of moss over the drainage, and then put in the plant, filling up to the rhizome of each plant with good fibrous peat and a little sphagnum-moss. Take care to use a reasonable quantity of small crocks with the material, as the plants when in full growth require an almost unlimited supply of water. Plants of Bulbophyllum and Cirrhopetalum, &c., are never all ready for re-basking at one time, but each should be attended to when new growths have commenced to push. Following root-disturbance, the plants must be very sparingly watered until they have made some new roots.

Cool-house Species.—One of the most interesting of cool-growing species is Polycynis Lehmanni, which produces sprays of very remarkable and pretty flowers. The same remarks are applicable to the rare Sievekingia Reichenbachiana; they should be suspended to the roof in shallow pans, in a rather good intermediate temperature. The new Trevorla Chloris also appears to thrive well in a similar position. Pleurothallis macroblepharis is a small-growing Orchid, but the singular beauty and curious structure of the flower, which have a resemblance to some species of gnat, are extremely interesting. P. ornatus is a dwarf-growing species; its dusky flowers are covered with dark-purple spots on the surface, and oscillating white hairs on the margin of the segments. Pleurothallis grows well under ordinary cool-house treatment; also such curious species as Octomeria, Restrepia, Stelis, Sigmatostalix radicans, Phrysosiphon, Sarcophilus, Promenæ, Diurus, &c.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Carrot Forcing.—A hot-bed constructed for the forcing of Carrots should be made of such material as will maintain a steady heat of 75° to 80° for a long period, namely Beech, Oak, or Chestnut-leaves. If the hot-bed be made on the surface of the ground, litter must be used on the outside, or it will fall to pieces; but if made in a hole or a brick-pit, leaves only should be employed. The depth in any case must not be less than 3 feet, and if frames are to be used, the bed should measure 3 feet more in width and length than the combined frames. The Carrot, to be of the best quality, should not be hurried by bottom or top-heat; consequently the heat employed must be moderate, namely, 55° to 58° at night, 65° to 70° by day, and a bottom-heat not exceeding 80° in the bed of leaves, which will afford about 70° to 75° in the bed of soil. The latter should consist of sifted friable, light loamy soil, mixed with sifted decayed manure and leaf-mould; and it should be

about 1 foot in depth, and be brought to within 9 inches of the glass, and made firm by patting each 3-inch layer with a spade as it is being put into the bed. As a frequent application of water does harm to this crop, the materials should be fairly moist. The best varieties for forcing are Early Carentan (which may be sown thickly), Early Nantes, and French Horn. Sow the seed thinly, either in shallow drills or broadcast, and just cover them with finely-sifted soil. Hot-beds should be made up every third week, and sowings made till about the end of March.

Summer and Autumn-sown Carrots.—Carrots growing in the open ground and in cold frames are easily hurt by exposure to frost, therefore sufficient protection should be afforded. If part of the main crop is still in the ground, the roots should be lifted without further delay.

Turnips.—Let the principal part of this crop be stored in a frost-proof shed or in pits out-of-doors, cutting off the tops to within half-an-inch of the bulb, and leaving the root intact. Some of the bulbs may be left in the ground for daily use so long as the weather keeps open.

Mint.—About this date some strong roots may be lifted and planted in boxes or in beds of soil in warm pits, using a light porous soil to cover them. Mint requires a moist air, and a temperature of 60°.

Tarragon.—This herb is in some families in constant request; and roots should be lifted and boxed or potted in leaf-soil, and placed in a temperature of 50°.

Chicory.—A portion of the crop of roots may now be lifted, the tops cut off just above the crown, and be packed closely in deep boxes or Seakale-pots in rather damp soil of a light nature in the Mushroom-house, or a warm cellar to blanch.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Strawberries.—If it be intended to have ripe fruit in March next, some plants must now be taken indoors, and be subjected to slow forcing. If a house can be set apart for this purpose, let it be thoroughly cleansed beforehand by washing the woodwork and glass, and lime-washing the walls. Strawberries may be forced very well in houses with other plants, providing they be given light, airy positions near the glass, and a temperature of from 50° at night, 55° in the day, with a rise of 10° to 15° from sun-heat may be permitted. The atmosphere must be kept sweet by affording ventilation whenever practicable. Syringe the plants once on fine days, and at other times damp the paths and other surfaces in the house. Never permit the plants to become quite dry at the roots. The plants may be started into growth in a pit if necessary, placing the pots upon a bed of leaves. The hot weather experienced some time ago was conducive to insect pests, and before taking the plants indoors it will be well to lay them on their sides in rows on mats, and to syringe them freely with clean water, directing it well to the underside of the leaves. To check mildew, immerse each plant in a pail of water, into which has been mixed one half-pint of flowers-of-sulphur. Good varieties of Strawberries for early forcing are La Grosse Sucrée, Vicomtesse Héricart du Thury, and Royal Sovereign.

Peach-houses.—The trees in the early-house that were put in order for a start, if they are to afford ripe fruit in the month of May, should have the forcing begun very gently at the first, merely the ventilators being closed, so as to maintain a temperature of 45° at night, and 50° by day, in dull weather, with a rise of 5° with sun-heat, and so long as these temperatures are reached no artificial heat is required. The houses should be aired in the forenoon, and closed early in the afternoon. The trees should be syringed on fine days at closing time. Let an examination of the border be made forthwith, and if the soil is lacking in moisture a thorough application of water should be made. Let this kind of treatment be continued until the bloom-buds become prominent, then raise the temperature a few degrees.

The other Peacheries.—If new borders are being contemplated, or the exhausted top-soil replaced with new, and any planting of trees has to be done, let these jobs be finished as soon as possible. All pruning and tying, insect dressing, and cleansing of houses should be finished by the end of the year. Remember that only thorough cleanliness is of any effect in the battle with insect foes. If mealy-bug is the worst of these let the trees, woodwork, and hot-water pipes

be cleaned with strong suds, or use Gishurst's soap on the trees at the advised rates. Lime-wash the walls once or twice, and take away the upper crust of soil, replacing it with that which is new and sweet. Keep the house as cool as possible.

Peach and Nectarine Trees in Pots.—These trees are the better for being out of doors at this date. But the time is close at hand when they must be brought under glass or otherwise sheltered. In the south, a sheltered position out of doors, on a coal-ash floor, where water does not stay, with coalashes round about the pots, and to the depth of a few inches up the stem, make the trees safe for the winter.

Orchard-house Trees and Pot Vines for late Use.—These should be wintered out of doors similarly.

Late Pot Vines.—The canes may now be cut back to the lowest best bud, and this being done forthwith no bleeding will take place.

THE APIARY.

By EXPERT.

Starving Bees.—During the month of November the weather is generally so uncertain and treacherous that it is impossible at times to examine hives with anything like thoroughness; not only so, but if colonies are weak, or are located in large, cold hives, exposed to all the winds that blow, they cannot be induced to take syrup in such quantities as we wish, and sometimes the bees will die of hunger, while the feeder full of syrup is on the hive. In desperate cases of foodless hives at this late time of the year, the best course is to take out three or four of the empty frames and pour a good quantity of warm syrup into each, first on one side, and then on the other. Replace the combs in the hives towards evening, and after closing the entrance, remove it indoors. If it is kept in a warm room, the bees will feed, re-arrange themselves in proximity to the newly-supplied stores, and tidy up the wet combs before morning, when the hive may be returned to its stand. A good-sized cake of well-made soft candy—not the kind which becomes as hard as stone after a few days' exposure—weighing 4 lb. or 5 lb., will make safe a stock ill-provided with stored combs, and wherever there is scarcity, should be at once supplied. The cake, if moulded in a large saucer or soup-plate, in which a sheet of strong paper is laid before pouring on the candy, may be laid on the frames over the cluster of bees. Of course, the ordinary quilts may not be over the candy, so a rough, warm covering must be improvised. When all necessary work has been attended to, the less the bees are disturbed, the better; but in giving the final look round, it is well to remember that storms may be expected this month, and precautions are needed in view of hives being blown over—a good stock may be easily ruined by an accident of this kind. The general tidying up, so necessary about an apiary at this time of the year, will, of course be left to the taste of the bee-keeper; some will be content to leave all sorts of odds and ends which have been in use during the summer lying about for months until the opening of the New Year arouses them into activity again. We need scarcely say that the appearance of a neglected apiary in winter is wretched in the extreme, and will be but a sorry inducement to an intending bee-keeper to make a start in apiculture; while a few hives of bees well cared for and snugly housed, with all their surroundings in trim condition, is a very pleasant sight to see. We therefore urge one and all to set about it. When the hives themselves are completely put in order, clear away all rubbish, weeds, and everything that would give an appearance of neglect. See to the legs of hives. Any that are decayed or beginning to rot at the bottom must be repaired; a piece of slate under each leg is a good preservative, as it does not retain moisture. All old or useless combs should be melted down before the moth gets at them, while sections and frames containing combs intended for use next year must be carefully propped up and kept in a dry place as a protection from the same pest. Unsold honey left on hand, should be attended to without delay—that in sections will rapidly crystallise and become unsaleable if left in a cold damp place; while, if carefully wrapped up and stowed away in a warm dry cupboard, the sections will often be found in fine condition for the table the following spring. We are obliged to qualify this assertion, because sometimes the honey in comb will crystallise in spite of every precaution, in which cases the only resource is to melt the comb and honey, and skim off the wax while hot. Extracted honey only requires to be protected from the air and kept in a dry place, when it will keep good for years.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Nov. 28	{ National Chrysanthemum Society: General Committee Meet.
SALES.		
MONDAY,	Nov. 28	{ Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	Nov. 29	{ Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	Nov. 30	{ Dutch Bulbs, Japanese Lilies, Tuberose, &c., at Protheroe & Morris' Rooms.
THURSDAY,	DEC. 1	{ Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	DEC. 2	{ Dutch Bulbs, at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—41.3°.

ACTUAL TEMPERATURES:—

LONDON.—November 23 (6 P.M.): Max., 43°; Min., 33°.

PROVINCES.—November 23 (6 P.M.): Max., 46°, Exeter; Min., 35°, York.

Rules for
Judging.

If it be a cause for congratulation to the Royal Horticultural Society that its excellent cotagers and allotment holders' fruit pamphlet has been issued to the extent of ninety thousand, although not remunerative because it is so cheap, it is hardly less so that its first edition of some two thousand copies of the *Rules for Judging* pamphlet should have been sold out, and a fresh one be in preparation. The latter fact, although dealing with a much lesser number, still shows the esteem and regard in which the society is held in the United Kingdom.

Very recently the members of the committee who devoted so much time and thought so satisfactorily to the preparation of the original issue were called together to enable them to offer suggestions or amendments for a new issue, and also to consider suggestions from other sources. That after very patient consideration it should have been found needful to make very few alterations or additions shows how well the work was done in the first place. The chief addition, when the new pamphlet is published, will be found in an appendix devoted to the interesting subject of point judging. This matter, so long understood and practised by some, so novel and difficult to follow with

others, has been made clear in the appendix. So also has the more technical subject of "point values" in relation to prizes. Every good judge knows that in dealing with exhibits of considerable number, whether plants, flowers, fruits, or vegetables, that when exhibits run each other closely in point of merit, there is no other course open to enable an exact or correct decision to be arrived at, but by giving to every item in such exhibit a certain numerical value, and thus arrive at the total for the whole collection. That being so, one object of the reference to this matter in the new pamphlet is to induce all executive officials of a society to make use of it, and all judges to readily adopt it. If, still further, the scales of points for the best things shown, published in the pamphlet, be adopted, then something like uniform method comes universally into use.

But whilst pointing and the present common system of offering a certain number of fixed sums as prizes work harmoniously, the method, all the same, has very largely served to show the grave injustice done to exhibits that frequently run each other so close that only very small point values differentiate them. Thus, if one collection gets 60 points and a prize of £3, whilst the second is but one point less, but gets only £2, it is so very obvious that there is no equity in the original division, and that the collections should have awarded to them sums only slightly differing in amount. It is for this reason, in one case, and also because in some very notable cases alone, the practice of awarding prizes in money according to the points awarded, to or earned by each collection has already been adopted with so much success and satisfaction, that the subject of point values in prize-giving has been included in the new issue of rules for judging, and it may well attract the widest possible consideration.

Naturally, the old or arbitrary method of prize-money allocation has its admirers, and it is an excellent method for those who usually take 1st prizes. But whilst this class of exhibitors obtained so large a share of the cash, the lower competitors who run him so closely get much less than their due. Another matter which largely occupied the attention of the committee, was that already dealt with in certain sections. It is that of the difficult and painful act of disqualifying any competitor. It is felt that so invidious a duty should not be placed on the judges until the executive of a show or its representative has been consulted. It is too frequently assumed that disqualification results through fraudulent acts, but these are, after all, exceptionally rare. The majority of disqualifications results from some quite innocent or unintentional error on the part of the exhibitor, and when, in such case, he gets the slur publicly paraded of disqualification, not only does he suffer heavy pecuniary loss, but he suffers even more mentally. The punishment is cruel, and far beyond the needs of the case. Sometimes the exhibitor is the victim of another's error, or of some one's carelessness or wrong-doing. In any case, serious attention has been given to the matter by the committee, and it is hoped that the efforts made through the amended clauses in the pamphlet will secure universal approval. Some men perhaps like to show their little brief authority, and disqualify an innocent exhibitor with glee. It is hoped these are indeed few. In any case, additional effort has been made to tone down the harshness occasionally seen in these disqualifications.

LINNEAN SOCIETY.—On the occasion of the evening meeting to be held on Thursday, December 1, 1898, at 8 P.M., the following papers will be read:—1, "On the Biology of *Agaricus velutipes*, Curt.," by Mr. H. BIFFEN; 2, "On the Gastric Glands of the *Marsupialia*," by Mr. JAS. JOHNSTONE.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Secretary writes: "Mr. F. G. TRESEDER, Chairman of the Cardiff Chrysanthemum Society, has forwarded a cheque for £5 15s., being the amount realised at a stall held at the recent Chrysanthemum exhibition at Cardiff in aid of the above Institution."

NATIONAL DAHLIA SOCIETY.—Mr. J. F. HUDSON, Hon. Sec., desires us to announce that the annual meeting of the National Dahlia Society will be held, by kind permission of the Horticultural Club, in their rooms, at the Hotel Windsor, Victoria Street, S.W., on Tuesday, December 13, 1898, at 2 P.M.

PARIS CHRYSANTHEMUM EXHIBITION.—At the late meeting in the Tuileries garden, MM. VILMORIN ANDRIEUX ET CIE. received the grand prize of honour for their Chrysanthemums; and at the same time their foreman-cultivator, M. KRATZ, was made a Chevalier of the "Méríte Agricole."

MÉRITE AGRICOLE.—Among recent promotions in this order we may mention the promotion to the grade of officers of MM. CHARLES BALTET, LOUIS DALLÉ, and H. E. MARTINET, of the *Jardin*. M. DAUTHENAY, of the *Revue Horticole*, has been appointed Chevalier of the Order.

INFLUENCE OF HEAT IN DETERMINING THE SEX OF PLANTS.—M. MARIN MOLLIARD contributes to the *Comptes Rendus* of the Academy of Science for October 31, a paper on the "influence of temperature in the determination of sex," detailing experiments conducted principally with *Mercurialis annua* cultivated under varying conditions. Briefly, his conclusions are that, in *Mercurialis*, heat [as in the Vegetable-Marrow] favours the production of female plants. The action of the heat exerts an influence upon the seeds in which it is to be supposed that the sex is definitely formed, and subsequently favours the germination of female seeds; or it even may act further in determining the sex when the seed is formed. The author adopts the second theory which alone explains the modifications of sex previously detailed in the case of Hemp.

JADOO.—We are informed that no fewer than sixteen prizes have been awarded to this substance at the recent Philadelphia Exhibition. Other prizes were obtained in the same week at Bordeaux and Birmingham.

PHIPPS' CONSERVATORIES, SCHENLEY PARK.—These conservatories in Pittsburgh, Pa., are the gift of Mr. HENRY PHIPPS, and form a handsome range of houses, well stocked with choice plants. They are open at all reasonable hours to the public, who show their appreciation by coming "in hundreds and thousands, men, women, and children . . . and they never touch or pluck the flowers or plants. Last Easter Sunday 30,000 persons passed through the conservatories, and thousands came who could not get in." The plants exhibited are of many varieties, tropical, economic, and decorative; at certain seasons special floral displays (of Roses, Chrysanthemums, and so on) are arranged. The munificent gift has proved a real boon, and is maintained in a condition worthy of its value.

"FRUIT-CULTURE FOR AMATEURS."—By S. T. WRIGHT, Superintendent of the Royal Horticultural Gardens, Chiswick. (London: L. UPICOTT GILL, 170, Strand, W.C.) This handbook contains an appendix on "Insect and other Pests Injurious to Fruit Trees," by W. D. DRURY; and also many illustrations. The fact that it is the second edition which lies before us is itself a guarantee of the value of the book, and of the appreciation with which it has met. It is clearly written and reliable, while the small price and handy size commend it to many in preference to larger and more costly works.

WORKERS IN HORTICULTURE.—Mr. A. PINOTEAU has been created a Chevalier of the Ordre du Mérite Agricole for his services to horticulture, the honour coming to him upon the recommendation of the Minister of Agriculture of the Republic of France. It is the first time in history that this decoration has been bestowed upon a Frenchman whose work has been accomplished out of France, for Mr. PINOTEAU, says our Chicago contemporary, *Gardening*, is Superintendent of Logan Park, Montreal, Canada. His nativity was at Villeneuve-sur-Cher, France, in 1855. He pursued a course in the College d'Horticulture of the Department of the Berri, and came to Montreal in 1874. From 1882 to 1889 he was a member of the staff of Mount Royal Park. In the latter year he was appointed to his present position, where he has charge of the growing of plants for the twenty-six public squares of the city. He is doing that which makes the French order a well-merited tribute to his attainments, and this year provided nearly a half-million plants for the city squares. Mr. PINOTEAU is a member of the Montreal Horticultural Society, and of the Montreal Florists' and Gardeners' Club, and at all times has shown himself an enthusiast in the advancement of the art of the culture of flowers.

PARSNIPS.—A correspondent sends us a bunch of Parsnips which have made their way through a hole in the discarded sole of a boot, which happened to be in their way. The seeds had been sown very thickly, so that the roots are bunched together. It would appear as if the seedlings had sent down their radicles through a minute hole in the leather. It is of course possible that the radicles exuded a solvent fluid which dissolved or softened the leather, and so allowed them to pass through. This is what happens when Twitch perforates Potato-tubers. It is noteworthy that the roots in question became swollen, not above the point of constriction, as happens when a tie is allowed to remain too long on a branch, but below it. The thick roots act as reservoirs or store places for nutritive matters, and as the leaves and crown make great demands upon these stores, the current of nutritive fluid must in this case be upwards. This is obvious from the necessities of the case, and it is illustrated by the position of the swelling.

"BOLETIM DA SOCIEDADE BROTERIANA."—The fifteenth volume of this valuable publication, edited by Professor HENRIQUES, of Coimbra, is now in course of publication. The parts before us contain a biographical notice of the late JULIUS SACHS, an important paper on "Portuguese Monocotyledons," by Señor CONTINTO; a memoir on the "Phenology of Coimbra," by Dr. IHNE. The publication is issued in sheets, protected, or unprotected, by a very thin wrapper, which does not improve by laying on one's table with other periodicals.

"THE STORY OF THE FARM."—Such is the title of a small book by Mr. JAMES LONG (Rural World Publishing Co., London), containing various essays on Agricultural Economy. The object of the pages is "to call attention to certain cardinal features in connection with our agricultural system which demand the urgent attention alike of farmer, landowner, and parliamentarian." Hence we find chapters devoted to such subjects as: The land and its owners, the farmer's position, the labourer and his hire, aids to the future prosperity of agriculture, tenant-right, peasant landowners, farming of the future, woman in relation to rural industries, and the question "Can the British Empire feed its people?" The views expressed are on the whole optimistic, as though "we cannot, under present circumstances, produce all we require (independently of over-sea productions), but with fairer conditions we can produce a great deal more, and with the new life which such conditions will impart, we shall not only be able to defy an enemy—whom God forbid may never appear—but return to that course of prosperity which is the happiness and glory of a nation." The book is dedicated to the Countess of WARWICK, who has contributed an introduction to it on "Women and the future of Agriculture."

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual dinner of the members of this Society will be held on Wednesday next, November 30, at the Holborn Restaurant, at 6.30 P.M. The chair will be taken by Sir A. K. ROLLIT, M.P.; and the attendance of ladies is requested.

A PEAR-TREE BEARING TWO CROPS.—The very rare occurrence of a Pear-tree ripening two crops in one season has taken place this year in the garden of Mr. A. M. BEST, Headstone Villas, Harrow. At the usual season a tree of Williams' Bon Chrétien set a large number of fruits, many of which, in consequence of the hot, dry season, fell in an immature state. In September, however, a light crop of good fruits ripened, and at the same time the tree was again, in flower, and bearing a quantity of small fruits in various stages of growth. Some of these grew to about one-half or three-fourths of the size of the fruits of the first crop, and have since ripened. They are as good as the fruits of the first crop in every respect except size.

THE BALDWIN APPLE.—The issue of *Gardening* [United States] for November 1 has an illustration of a stone pillar commemorative of the discovery of the Baldwin Apple. The inscription runs as follows:—

THIS PILLAR,
ERECTED IN 1895
BY THE
RUMFORD HISTORICAL
ASSOCIATION,
INCORPORATED APRIL 28,
1877,
MARKS THE ESTATE
WHERE, IN 1793,
SAML. THOMPSON, Esq.,
WHILE LOCATING THE
LINE OF THE
MIDDLESEX CANAL,
DISCOVERED THE FIRST
PECKER APPLE-TREE,
LATER NAMED THE
BALDWIN.

PUBLICATIONS RECEIVED.—*Journal of the Board of Agriculture*, September, including papers on English Orchards, Imports of the Cereal Year, Essential Qualities of good Cider, Agricultural Returns of Great Britain, 1898; Aphides, the Pear-Midge, and similar subjects. — *Bulletin of the Botanical Department, Jamaica*, September, contains: Agriculture of the Sugar-Cane, III.; Banana-Meal, Jamaica Satin-Wood, &c.—*Queensland Agricultural Journal*, October, 1898. With articles on the following subjects: Queensland Agricultural College, Training at Agricultural Colleges, Potato Culture, Tobacco, Indigenous "Rubber" Plant (*Excocaria Dallachyana*), Scent-yielding Plants, Roses on Barren Soil, and Notes for the Month.—*Botanisches Centralblatt*, general register, über, Bant I. bis. LX, Heft 3.

DR. HAMILTON RAMSAY'S GARDEN, TORQUAY.

[SEE SUPPLEMENTARY ILLUSTRATION.]

THIS Devonshire garden, a view in which is given in our present issue, is rich in plants, such as we in more northerly and less genial climes associate with the greenhouse and other plant structures. Our correspondent in that part of the country, Mr. W. Swan, visited the place on the occasion of a garden-party being given therein in aid of the Torquay Sick Gardeners' Relief Fund, usually connected with a Rose-show held in the Devon Rosary Grounds, but which this year had to be abandoned.

Dr. Hamilton Ramsay happily suggested a garden-party in its place, so that the fund should not suffer. The Doctor placed a good portion of his residence and charming grounds at the disposal of the committee, and here the garden-party was held in the afternoon. The party was conducted by the Doctor himself, who led the way through the house and all over the grounds, and pointed out the many objects of interest in the rare exotic plants naturalised in the open air. These experiments have been attended with remarkable success. A rare plant, growing in a sheltered nook, and fastened to wires on the wall, was *Sophora chinensis*, then bearing a crop of seed-pods; and near this a large plant of a scarlet-flowered *Abutilon* in abundant flower; a grand *Maréchal Niel* on the house, vigorous and uncanceled, which was worked on the China or Monthly Rose; Palms, *Dracenas*, *Phormiums*, *Benthamia fragifera*, with ripe fruits still on it; *Colletia horrida*, a very fine specimen; *Spiraea Lindleyana*, *Plumbago capensis*, and a *Heliotrope* twenty-six years old, both of these finely in flower; *Aralia Sieboldi*, one of the biggest in the country, in magnificent bloom; *Solanum jasminoides*, greenhouse varieties of *Fuchsia* growing in the open, 14 feet in height, and attached to a wall; *Choisya ternata* coming freely into flower, a fine specimen of the Loquat in bud, various *Cliveas*, *Corypha australis*, *Chamarops Fortunei*, with abundant fruits, and young self-sown plants coming up under them. *Cannas* do splendidly here, and especially *C. Ehemanni*, a crimson-flowered variety, introduced about eighteen years ago.

Dr. Ramsay has been a keen gardener all his life, and is now nearly seventy-four years of age. Quite recently he received a presentation from the Torquay Gardeners' Association, which has given him great gratification.

He filled the high office of Purse-bearer to the Lord High Commissioner to the General Assembly of the Church of Scotland, an appointment which he held under twelve Commissioners for the long period of thirty-nine years. On his retirement he received an address, a silver loving-cup of antique plate, and a purse of sovereigns, as a testimonial from the members of the Assembly, which included some of the most eminent men in Scotland.

FLORISTS' FLOWERS.

SOME NEW WHITE VARIETIES OF CHRYSANTHEMUMS.

SOME of the recent novelties, both of continental and home production, are varieties of different shades of white that really seem to merit a few words of special commendation. Many of the best are from the well-known raiser, M. Calvat, whose Madame Carnot is probably the finest Japanese Chrysanthemum in the world [it has recently been dethroned by the Société Nationale d'Horticulture].

ture. Ed.], and whose other whites, such as Madame Gustave Henry, Souvenir de petite Amie, Mdle. Thérèse Rey, Baronne Ad. de Rothschild, Madame Ad. Chatin, Ma Perfection, Mdle. M. A. de Galbert, are already well known. One of the finest additions this season is Miss Mary Leschelles, a pure white sport from Reine d'Angleterre, similar to its parent in form, but owing to the purity of its tint, far superior. Madame Madeleine Expulson is another; Madame G. Bruant is very large, usually white, but often faintly streaked with rose; Mdle. Lucie Faure is of fine incurved form, large in size, and very solid; so, too, is Madame Ferlat. Antoinette has been seen in very good form, but is not new.

M. Louis Rémy, the white sport from Mrs. C. Harman Payne, is very large, and is highly thought of by some, but the English sport, Lady Ellen Clark, from the same parent, is in all probability identical. Nellie Pockett, a new colonial white, is large, and a well-built flower; Lady Crawshaw is large, deeply built, and the colour creamy-white, slightly tinted. One of the most promising is undoubtedly Jane Molyneux, it is of great size, has long drooping florets forming a noble flower, and the colour is white, but rather creamy in tone. C. H. P.

NOTICES OF BOOKS.

DANTE'S GARDEN, WITH LEGENDS OF THE FLOWERS. By Rosemary A. Cotes. (Methuen & Co., 36, Essex Street, Strand, W.C.)

The outside of this small volume suggests that Dante could have had but a little garden, while the inside unfortunately shows that the compiler was but little acquainted with the horticultural portion of her subject. Some twenty-four names of plants are included in the table of contents, and these are treated of in separate chapters, where their presence is accounted for by more or less apposite quotations from the poet. The inclusion of legends, which possibly were familiar to Dante, will be novel and interesting to many readers, although the author sadly confuses the plants to which they refer. Thus, we are assured that "the flowering Rush, known by the name of Acis, is the dwarf species of Amaryllid; . . . from the blood of Acis arose the first flowering Reed."

Again, the white and fragrantly-flowered Philadelphus is decidedly not "dedicated to the Reed-nymph Syrinx, after whom, as a hollow-stemmed plant, it was named when she [Syrinx] was changed into a Reed, from which Pan made his pipes."

The English translations are taken from Cary's *Vision of Dante*. We recommend the compiler to avail herself of the friendly aid of some competent botanist before she publishes any more extracts or theories, and thus avoid the rather serious errors and anachronisms into which she has fallen.

THE FARMER AND THE BIRDS. By Edith Carrington. With preface by Canon Tristram, F.R.S. (London, George Bell & Sons.)

As regards the scope of this book, we cannot do better than quote from the author's introduction—"The theory of the compiler, in a nutshell, is this: that while the over-multiplication of certain birds may be dreaded, the presence of all, in moderation, is useful; and that where over-multiplication has taken place, it is wiser to use natural rather than artificial remedies." This is no doubt the case; the difficulty being to first learn, and then to prove to others what constitutes a surplus population of birds, and how, living as civilised men must do, an existence largely artificial, it is consistent to restore the perfect balance of nature, and yet maintain supremacy over other creatures. As regards birds which form the subject of Miss Carrington's book, it is impossible not to sympathise with her in her feelings concerning them. For this contains no attempts at fine writing, no high-flown descriptions of beautiful feathers and songs, but consists chiefly of verified statistics linked together with remarks so temperate that none could object to them. It is a common-sense

appeal to the pockets, and not to the poetical feelings of the farmer. Of course, all the arguments are one-sided, that is to say, written in defence of birds, but there is no attempt made to contradict or gloss over opposition truths. Certainly some birds do damage, but to a small extent when compared with their kindly deeds in destroying noxious insects. All classes of feathered creatures are defended; swallows overhead, cuckoos, nightingales, and summer workers below; workers all the year (robins, buntings, finches, thrushes, and so on), and slandered workers such as sparrow-hawks, owls, kestrels, and doves. Even the hunted house-sparrow finds an advocate, the author declaring that his tribe, at least in the country, do more good than harm.

The book is well arranged, and should be widely distributed and read. Miss Carrington's appendix on the law about birds, also deserves mention and perusal. Would that any laws could restore species exterminated by so-called sportsmen.

BULLETIN OF THE FRENCH HORTICULTURAL SOCIETY OF LONDON.

THIS annual publication, the ninth of its kind, has recently come to hand, and is, indeed, strong evidence of the continued prosperity of a society that has of late years met with much success. Unlike many other horticultural societies, the one presided over by Mr. George Schneider, does not depend upon flower-shows for its support, but in a large measure upon the *esprit de corps* of its many members at home and abroad for its maintenance, and for the carrying out of its objects, which are now well known, and have often been alluded to in the organs of the English gardening press.

The present issue is a great improvement on some of the earlier ones, and contains 142 pages of printed matter, comprising, amongst other things, a record of the Society's monthly meetings, the rules, financial statement, library acquisitions, annual report, &c.; and a series of interesting papers by the members on various horticultural subjects, the names of a few of which it will be useful to mention, to show the general tenor of the literary matter. They are: Laing's Floral Peacock, with a photographic reproduction; Anthuriums; Notes on the Cultivation of Pelargoniums, Lilies, Adiantums; Lilies of the Valley, and their Culture; Culture of the Fuchsia; English Cultivation of Bouvardias, Impatiens Sultan; Orchids at the Royal Gardens, Kew; Report of the London Chrysanthemum Shows in 1897; and several others.

The *Bulletin*, which makes a volume of some size, has several illustrations explanatory of the text, and the frontispiece consists of an excellent portrait of Mr. Harman Payne, whose claims to the Society's recognition are discussed by the president.

It is pleasing to record that the numerical and financial position of the Society seems in every way to have improved during the past year, and there is no doubt that the young men for whom the Society is primarily established greatly appreciate the labours of the executive in their behalf.

ANNUAL REPORT OF THE DEPARTMENT OF PARKS, BOSTON, U.S.A.

THIS Report, for the year ending January 31, 1898, chronicles no small amount of useful work successfully achieved. It is pleasant to hear of the various parks and play-grounds scattered about so large and densely populated a district, and that they are something better than mere shrubberies and meadows. The plantations are thoughtfully planned and skilfully kept up, while the recreation-grounds are especially adapted for various games, and not simply wildernesses. In connection with the open spaces are such institutions as gymnasiums, kinder-gartens, and, at the sea stations there is every accommodation for bathing. Various fresh plots of land have been acquired in the past year, and these are additionally valuable in view of the ever-increasing growth of the city. In the parks, native trees and shrubs are to be planted in preference to those from foreign countries, because these "grow more successfully, live longer, and

require less labour to keep them in good condition." The effect of them, from an artistic point of view, is likely to be far more natural, and, therefore, beautiful.

XYLEBORUS MORIGERUS.

SOME short time ago a pseudo bulb of *Dendrobium* was sent to this office by a correspondent infested with an insect, which he told us did much harm for its size (fig. 112, p. 389). He also forwarded a letter from an eminent entomologist containing a description of the insect, which we now publish:—

"It is now six or seven years since I had my first specimens from Bath, since then I have had it from two or three other localities in England, from Marseilles, Germany and Austria (or Hungary, I forget which), always as attacking *Dendrobiums*. Except by destruction of the plants, or at least of such portions as are attacked, which will necessitate a careful periodical search, I cannot suggest any satisfactory treatment. It is worth recollecting that the beetles themselves burrow in the stem to lay the eggs there, so that an untouched stem, or rather pseudo-bulb, ought to be really, and not merely apparently free from injury. It is just possible that washing the stems with lead arsenate, or something of the kind, might protect them. But this is purely a matter for experiment, and cannot be recommended upon any more solid grounds. I hope the creature will not do much damage. It has evidently got disseminated from some centre of importation." Walter T. H. Blandford.

HOME CORRESPONDENCE.

THE TIMELY PLANTING OF BULBS.—Mr. W. C. Wordsell (p. 361), in writing on "the principles and practices of bulb-growing," touches on the question of the proper season for planting, and rightly observes that such bulbs as Snowdrops and Crocuses must be put into the ground quite early in September at latest. But Mr. H. W. Ward (p. 348), states that "the present (November 12) is a good time to make plantings of most kinds of hardy bulbs out-of-doors for yielding supplies of cut-flowers for marketing next spring," and specifies Daffodils, Spanish Iris, and Snowdrops. Now, if the direct contradiction is not discourteous, I must assert that the middle of November is altogether a bad and a wrong time to plant these bulbs, and my opinion would not be high of the knowledge or the prospects of a market-grower who would plant on any large scale at so late a date. That amateurs still do so is evident from the advertisements of these bulbs which appear abundantly up to Christmas or even after. Few plants are treated with such scant consideration and so ignorantly as spring-flowering bulbs. Probably the long reign of the bedding-out fashion has had something to do with this: the ground could not be spared for bulbs until frost had cleared away the Pelargoniums and Lobelias. For this and other reasons the gardener came to regard bulbs as matters not to be thought of until all outdoor flowers were past. It is also a neat and convenient arrangement for the dealer to sell his bulbs during the "dead" season between Michaelmas and Christmas. But it is, of course, an utterly irrational proceeding to plant a Snowdrop (which in a mild winter may be in flower at the New Year) late in November. Any one who has really studied these plants knows that no bulb deteriorates so speedily when out of ground as the Spanish Iris. August is certainly the best month for planting it. The same week that Mr. Ward's notes appeared, my Narcissus-beds were being Dutch-hoed, and it was found that the very shallowest skimming was necessary, and extreme care at that, since the foliage was already level with or even breaking the surface. Let any one who is doubtful lift a few Narcissus bulbs in July, and note the fresh roots already put forth. Of course, it must be in human nature for the dealer to assure his customers that such bulbs planted in November will flower well in spring, and to some extent this is not untrue, for they are long-suffering, and resolutely bent upon attaining their end—i.e., flowering, and propagating their kind. But it is a simple impossibility that bulbs which naturally start into fresh growth in July and break the soil before Christmas, can, when planted three full months too late, accomplish to perfection their

threefold work of (1) producing the finest possible bloom, (2) making offsets of the maximum size, and (3) maturing their flower-buds for the second season hence. The contention of the dealer may be refuted by one plain question. Would he, if he had given £100 for some rare bulb of one of the kinds mentioned plant it himself in November? Common sense teaches us that in two English Novembers out of every three the soil is chilled, wet, and sticky, and a sorry lodging for bulbs with vitality already impaired by long exposure out of ground. *George Engleheart.*

HARDINESS OF SELAGINELLA DENTICULATA.—The reference to this plant in last week's *Gardeners' Chronicle*, reminds me of having seen a very large patch of it growing among the grass on the lawn at Kilmory, Lochgilphead, Argyshire. The late Mr. Brown, who was then gardener at Kilmory, said it had been growing there for years and was spreading rapidly. The patch was mown with the rest of the lawn, and it had become a dense green carpet. It would be interesting to know whether the patch is still flourishing, and if so, to what distance it has extended. *D. C.*

THE NATIONAL CHRYSANTHEMUM SOCIETY AND THE AQUARIUM.—More than one who has "taken up the cudgels" on behalf of this building as being the most suitable place in which to hold our exhibitions, claim that it is due to the place that the Chrysanthemum has attained such popularity. May I ask why the exhibitions which were held in the Aquarium some twelve or fourteen years ago did not make the same progress? I believe the present secretary of the National Chrysanthemum Society was the one engaged by the Aquarium Co. to organise those shows. Certainly, with the same secretary and building, they should have been continued to a great success, if there is any truth in the argument alluded to above. The National Chrysanthemum Society has been able to supply better paying exhibitions than those held previously by the Aquarium Company. If the Crystal Palace is too far away for the public to visit the exhibitions of the National Chrysanthemum Society, why do so many thousands visit the shows of cycles, poultry, &c.? *A. B. C.*

THE DISQUALIFICATION AT THE N. C. S. SHOW.—That the judges were bound to sustain the ruling of the classification committee none will dispute; but among other incurveds which are included in the list of "too-much-alike" varieties, and which are prohibited from being shown in the same collection, are C. H. Curtis and Major Bonaffon. In the *N. C. S. Year Book* the description given of these would lead anyone to think they were very dissimilar. The former is described as "colour rich golden-yellow, petals long and pointed, a large deep flower, perfectly incurving, robust, mid-season." Major Bonaffon is described as "pale yellow, large, rather flat, narrow petals, closely incurving, very strong grower, late and dwarf." Both varieties have been certificated by the N. C. S. as distinct varieties. I do not wish to infer that the N. C. S. is wrong in bracketing these varieties as being too much alike, but more care should have been exercised in the description of them by the compilers of the *Year Book*. *W. J. G., Exmouth.*

YOUNG GARDENERS AND THE ROYAL HORTICULTURAL SOCIETY'S EXAMINATIONS.—The letter of your correspondent, "A. D." (p. 354), on this subject calls attention to a matter with which young gardeners have certainly reason to be dissatisfied. The writer's proposed remedy is, however, too unsuitable to be thought of. To my mind, the remedy is quite simple. As at present conducted, the list of successful candidates is arranged in order, according to the number of marks gained, and with these marks prefixed to each name. Surely this is an antiquated method of procedure. Would it not be better to arrange the names in alphabetical order in each class, leaving the number of marks gained unpublished? By these means, an examination which now appears to be, to a certain degree, competitive, would be changed into one, simply judged into classes, each with a fixed minimum number of marks. Thus, I think, all cause of dissatisfaction would be removed. As a young gardener, and one who intends entering for their next examination, I offer this suggestion to the Royal Horticultural Society. *P.*

—With reference to the notes by "A. D." re the above subject, in your issue for November 12, p. 354, I quite concur with the Editor's closing remarks. In my young gardening days—and I can recall them with pleasure, for the midnight oil was

often burning in the bothy I then occupied—I underwent examinations which were then held annually by the Council of the Society of Arts, the Royal Horticultural Society, and the Science and Art department, South Kensington. The rules and conditions usually supplied to candidates invariably specified that a thorough knowledge of the subject was the first consideration; good composition, orthography, neatness of writing, &c., being secondary points. No examiner could possibly overrule such conditions of examination, especially in technical subjects, where a want of knowledge must be considered absolutely unworthy of a certificate, notwithstanding the excellence of literary composition. But why should young gardeners of the present day contend that they are incapable of

FIG. 112.—XYLEBORUS MORIGERUS: DENDROBIUM-BEETLE.

A, Pseudo-bulb; B, the same divided.

(See p. 388.)

literary composition, or that they are not competent in note-taking? The opposite ought to be the rule. In the first place, the facilities for obtaining a good early education are far in advance of the times when gardeners of my age went to school; also, the conditions of gardeners' everyday life produce greater tendencies towards the development of superior attainments in their intercourse with each other. Take, for instance, the advantages of mutual improvement societies, the greater number of horticultural exhibitions, &c., than formerly existed; the various benevolent institutions, the privileges the R.H.S. has offered to gardeners of all grades in taking part in their numerous debates, exhibitions, &c. Surely these onward movements have materially improved, not only the practical status of the present-day gardener, but the literary aspect of his condition too. To those who aver differently, my only answer must be, that they have greatly failed in deriving the best possible advantages from these institutions. Take again the illustrated descriptive catalogues that

are issued now in comparison to what we had from twenty-five to thirty years ago. Many of these catalogues may almost rightly be termed text-books, the graphic descriptions they give of plants, fruits, flowers, vegetables, botanical terms, natural orders, periods of flowering or ripening, origin and introduction of varieties, methods of propagation, &c., these, if carefully perused, contain funds of valuable information, in such simple language, that the youngest of the fraternity may easily understand and realise. The remarkable cheapness of other standard works from the press, and the improved tone and number of our serial publications, render self-help to gardeners no longer a thing of the past. But we have other sources also of finishing-off, if such a term is applicable, our horticultural education, both in a practical and literary capacity, through the medium of the "correspondence classes" which have been instituted during the past few years. What would I have given for a coach between the ages of eighteen and twenty-four, when my efforts were being strained to the uttermost? I well remember how pleased I was to receive the advantages of a few hours weekly in botany from the clergyman of the village. Looking also on the other side of the picture, there are far more inducements for gardeners to improve themselves than formerly, for horticulture, along with the other branches of art and science, has experienced the progressive effects of its revolutionary movements. The good situations which exist now are legion, compared to what they were. Take first the situations that municipalities have created, principally through the agency of sanitary improvements. County Councils, also, acting under the guidance of a technical instruction committee, have appointed numerous lecturers and demonstrators in horticulture. Market gardening in all its phases is fast becoming an important factor in agricultural pursuits, which is also opening out positions for experts; and this progressive movement in commercial horticulture being as yet in its infancy, undoubtedly further and greater developments in plant, fruit, flower, and vegetable growing will occupy thousands of acres more of land in our rural districts, which must tend to the promotion of individual talent and knowledge. With these positions at present within reach, and the possibility of further advances which must accrue as science in connection with horticulture and agriculture paves the way for higher methods of cultivation, and consequent better production of good supplies, our young gardeners ought clearly to realise the importance of devoting the importance of devoting the leisure hours of their earliest years to study. In concluding these remarks, I cannot refrain from calling the attention of my young fraternity to the "correspondence classes" now being advertised in the horticultural journals. By following a course of study there presented, they may receive a practical and literary education for a small fee weekly that will enable them to hold their own with college and laboratory students, provided that they will strenuously persevere in keeping pace with the work issued every week, which means incessant work and much self-denial for a year or two. It is astonishing what assistance experienced coaches have been to self-taught students in other scientific and commercial walks of life, and what difficulties have been overcome by their timely aid and influence. The duty of a good "coach" extends further than to correct and revise the work of his students; he should admonish where he finds weakness, stimulate where there is a lack of energy, give influential precept where carelessness prevails, define the importance of attention to minor details, and, above all, set a good example by keeping good pace with the work himself; never allowing the student to feel that he is being neglected by having to wait either for his examination-paper or the revision of his work. *Coach.*

THE SEASON AND ITS EFFECTS.—Mr. Mawley writes: "I am sending you two photographs, representing two non-competitive exhibits, one of Roses and the other of Chrysanthemums, which I set up at our local Chrysanthemum show on the 9th inst. In no previous year have I been able so late in the season to gather so many or such fine Roses. They were entirely from the open ground, and have received no protection whatever. *Edwd. Mawley.*

THE CAPE GOOSEBERRY.—I am sending you some fruits of the Cape Gooseberry grown out-of-doors, perfectly ripe, and of the usual size. The seeds from such fruits as those sent germinate freely on being sown in the spring. My employer wishes me to grow a good quantity next season for jam-

making. He has had some of the fruit converted into jam this year, but does not consider it so good in flavour as that which he has bought at the shops. I should be glad of any advice as regards the cultivation of the plant. *C. G. S., Plymouth.* [The plants, if set out when two years old against a south wall, should ripen good fruits in your locality. The growths should be trained thinly, close to the wall, and not crowded. It needs a generous, free, sandy soil; and to be kept free from red spider. Ed.]

THE DUTIES AND WAGES OF A GARDENER.—Some time ago, being in want of a situation, I inserted in a local newspaper the following advertisement:—

"Gardener (head), age 30, experienced in Vines, Melons, Cucumbers, Peaches, Chrysanthemums, Orchids, stove and greenhouse plants, kitchen and flower gardening, &c."

I received this reply. "October 15, 1898. In answer to your advertisement . . . I want a head-working gardener to take a position of trust. I shall be glad to see your references from your present and previous employers, and state your reason for leaving in both cases. In addition to the allowance I make, viz., free house, coal, vegetables, and lamp-oil, I only wish to give 19s. or 20s. per week, to include wife's services in scrubbing office-floor and stairs once a month, boiling poultry food daily, washing during our visit here, attending to my wants on weekly visit, and preparing house for our annual visit. I live here only about three or four months in the year, but pay weekly visits, and keep one horse to meet me at the station, it being looked after by a youth who assists in the garden, and whom the gardener is expected to board at 6s. to 7s. per week. Everything will be in the gardener's charge. The total area of my property is about four acres, divided into an acre of kitchen garden, two glasshouses about 50 feet long, each containing Vines, &c.; house and other buildings, plantation, orchard, lawns, &c. What family have you? of course, I should object to the children running about the garden at any time. Are you a total abstainer? If my terms are not acceptable, state what would be." *F.*

THE RENOVATION OF OLD AND SPENT ORCHARDS.—I will give you many readers an accurate description of the methods adopted with an old and exhausted orchard, which after the treatment received gave every satisfaction, both as regards the crop and the quality of fruit. The trees in the orchard here alluded to are from seventy to eighty years old, and the land has always been under grass. The trees were very much cankered, and clad with lichen and moss. Last December men were set to cut out all decayed and cankered branches, and to afford the trees a careful and thorough pruning, admitting as much light and air as possible into the heads of the trees; then the turf was removed around each for a distance of 5 feet from the stem and carted away, and the denuded soil carefully pricked over with a four-pronged digging-fork. Then each tree had a good mulching of farmyard manure of about 5 cwt.; all having been made neat and tidy, the garden-engine was brought into requisition, and each tree given a thorough soaking of pond-water, washing down to the roots the constituents of the manure. To all appearance the treatment the trees received has put new life and vigour into them, as they have made during the summer fine, strong, healthy wood. I send you a sample of some fruit gathered from the trees so treated, namely, Blenheim Orange Pippin, King of the Pippins, and Ribston Pippin, all of which will testify as to the quality of fruit gathered from an old and spent orchard [excellent]. I may say, that the labour and expense involved will amply recompense the cultivator, and when the produce is put upon the market the returns will be also remunerative, as remarked lately one of the principal market-salesmen, as he drew my attention to several skeps of Apples sent for sale that were a very poor sample as to size and quality. That some people in possession of very good orchards seldom, as a rule, look into or take the least interest in them from the time they gather the crop until the next year. *George Mackinlay, Wrest Park.*

RHODODENDRON CHAMÆCISTUS.—Will you kindly explain why some botanists have thought fit to correct Linnaeus, and to create a new species for our charming little *Rh. chamæcistus*? which has, in my opinion, the same right to the name "*Rhododendron*" as *eleagnoides*, *pendulum*, *salignum*, *nivale*, or even *setosum*, of Sir W. Hooker. *Constant Reader.* [The genus *Rhodothamnus* was established by the elder Reichenbach (*Flor. Germ. Exc.*, 417, and *lc. Flor.*

Germ., t. 1157, f. 4 to 5) It was adopted by Bentham and Hooker, *Genera Plantarum*, ii., p. 597 (1883), and is maintained in the *Index Kewensis*, Fasc. 4, p. 713 (1895). It is distinguished from *Rhododendron* chiefly by the seeds, which have a crustaceous, leathery coat, instead of a loose membranous one. The disc surrounding the ovary is inconspicuous, whilst in *Rhododendron* it is readily seen. The capsule is loculicidal instead of septicidal, as in *Rhododendron*. We think botanists are morally bound to follow the indications of the *Index Kewensis*, until due cause be shown to the contrary. In gardens where convenience rather than strict technical accuracy is studied, the plant may still retain its old name. Personally, we should have preferred to make *Rhodothamnus* a section of *Rhododendron*, to which it is surely as near as *Azalea*, but that is a matter of opinion. Ed.]

UTILISATION OF GREEN TOMATOS.—In the *Gardeners' Chronicle* of November 12, 1898, p. 354, "D. F. F." writes, that Tomato-growing in the open would not pay unless the green fruit could be "converted into pickles." But there are other ways of utilising the green Tomatos which remain at the end of the season on the plants grown in the open. Here is a recipe for making green Tomato jam, which is very nice:—6 lb. of green Tomatos, 4½ lb. of sugar, juice and grated rind of three lemons, six teaspoonfuls of ground ginger. Break up the green Tomatos, and boil them in their own juice (no water) till the skins are quite soft. Add the sugar and the other ingredients, and cook as for ordinary jams. Besides using it as jam, there is a nice sweet dish that can be made out of it, called "golden toast." Soak a thickish slice of bread (or more according to need) in milk for half-an-hour. Then fry it a golden brown in hot butter; spread some of this Tomato jam on it, and keep it hot until ready to serve—very nice. Then green Tomatos make very good soup by boiling them in their own juice as above, and pressing them through a sieve, and mixing the green *purée* with stock and seasoning it. But as the green *purée* is somewhat acid, it requires the addition of a teaspoonful of sugar. Then, again, there is an Italian way of cooking green Tomatos. Fry a chopped-up clove of garlic in oil till it begins to brown (it should not get burnt), with a seasoning of finely-chopped Sage, add a few tablespoonfuls of stock, and cook the green Tomatos in this, cut in halves transversely, add pepper and salt, and when done bind the whole with the yolks or two or three eggs beaten up. Many persons are at a loss to know what to do with the green Tomatos remaining on the plants in the autumn, and these are various interesting ways of utilising them. *E. Bonavia, M.D.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 22.—The usual fortnightly meeting of this Society was held on Tuesday last in the Drill Hall, Westminster. The sudden change in the temperature that took place during Monday night very possibly influenced the character of the exhibition, there being few tender species of plants before the Committees. The display upon entering the hall might reasonably have been mistaken for a Chrysanthemum exhibition, as Chrysanthemums were the predominant feature of the show. Many large collections of cut blooms from amateurs and the trade contributed to this result, but the premier-exhibit was one from Mr. NORMAN DAVIS, Framfield, Sussex, a description of which will be found below. This exhibit was an excellent lesson in effective arrangement, as well as being an example of unusual cultural merit. Decorative plants were shown by Mr. MAY, of Edmonton, and there were a few other species of plants, including some of Messrs. VEITCH's winter-flowering Begonias. There were few Orchids shown, but these included some valuable novelties from Sir TREVOR LAWRENCE's collection. Very little fruit was submitted to the committee, and the only award given was made to an Apple from Messrs. HARTLAND, of Cork.

Floral Committee.

Present: W. MARSHALL, Esq. (Chairman); and Messrs. Jno. Fraser, C. T. Druery, Geo. Stevens, Jas. Hudson, C. J. Salter, Chas. E. Pearson, Geo. Gordon, J. T. Bennett-Poll, J. D. Pawle, Chas. E. Shea, Ed. Beckett, Chas. Blick, D. B. Crane, Chas. Jeffries, and Jas. Walker.

Decorative plants were again shown from Mr. H. B. MAY's nurseries at Dyson's Lane, Upper Edmonton. There were *Adiantum* Ferns, *Gloire de Lorraine* Begonias, many pretty varieties of *Asplenium* and *Davallia* Ferns. *Dracena Sanderi* was also noticed in small but pretty specimens, and a number

of varieties of *Cordylina*, with variegated and coloured leaves, affording considerable variation in these respects, from the broader-leaved *Renarde* to *Perfection*, *Jamesii*, and others with leaves of comparative narrowness. A small group was made also of *Bouvardias* in bloom, both double and single-flowering varieties, including the bright scarlet *President Cleveland*, *Priony Beauty*, a very pretty single pink-flowered variety; and the well-known *Vrelandi* (*Silver-gilt Banksian Medal*).

Messrs. T. CRIPPS & SON, Tunbridge Wells, contributed a group of plants of *Euphorbia* (*Poinsettia*) *pulcherrima*. These well-grown plants, about 2 feet in height, being arranged on the floor, created the most vivid colour-effect in the building (*Silver Flora Medal*).

Mr. W. BULL, new plant merchant, 536, King's Road, Chelsea, showed as a new plant *Epiphyllum truncatum* *Princess*, with pale bluish-coloured flowers, and the habit of the type (*First-class Certificate*).

ALFRED KINGSMILL, Esq., The Holt, Harrow Weald, showed berried shoots of *Vitis heterophylla*; and a shoot of *Skimmia Formani*, furnished fully with the berries of 1897 and 1898.

Mr. GILBERT CHRISTY, 25, Lime Street, London, showed two plants of a rare species of *Begonia* from Brazil, named *venosa*. It had a thick, fleshy stem 1 foot in height, of a pinkish tint, and leaves covered on both sides with a white tomentum. The flower-stalk was terminal, 12 inches long, and the flowers were small and white.

Messrs. J. VEITCH & SONS, LTD., Chelsea, showed again the beautiful-flowered hybrid *Begonias* *Myra*, *Winter Cheer*, and *Ensign*, raised between *B. socotrana* and some tuberous varieties.

Sir TREVOR LAWRENCE, Bart., Burford (gr., Mr. Bain), showed six plants of *Ornithogalum lacteum*, a species with thick, fleshy leaves, and flower-stalks 20 to 24 inches high, terminated by a spike of pure white blossoms, having yellow anthers.

CHRYSANTHEMUMS.

The most striking exhibit of Chrysanthemum blooms was one from Mr. NORMAN DAVIS, of the Framfield Nurseries, Sussex. One of the oldest growers, Mr. Davis is evidently one of the most skilful, and since he removed his sphere of operations from crowded Camberwell to a purer district in Sussex, he has shown some extraordinarily good flowers. The exhibit on Tuesday was displayed on one of the central tables, and covered about a half length. In the centre of the table were some handsome vases and trumpet-glasses, the latter being more than 8 feet in height. One of these prettily furnished with good blooms of Western King, and *Berberis* and other suitable foliage capably illustrated the best way in which to see these large, somewhat formal-looking, Chrysanthemums. It was certainly praiseworthy. A basket, splendidly furnished with single-flowering varieties, was more artistic, but less bold and handsome. The exhibit very finely exemplified almost all the varied forms the Chrysanthemum has yet adopted, and in small baskets were the thread-like flowers, as Mrs. Jas. Carter and others. Larger, but still decorative varieties, including *King of Plumes* (yellow), *Framfield Pink*, *Queen of the Market*, a new one, *Ivory-white* in colour, with good but not high centre, &c. There were a few *Anemone*-like blooms, and also some of *Pompons*.

Five or six dozen blooms of *Madame Carnot*, and the yellow sport, *G. J. Warren*, in lesser quantity, showed the Japanese Chrysanthemum in its largest, we had nearly said monstrous, size. Mr. DAVIS has always shown this variety in extraordinary fine character. A small Gold Medal was deservedly awarded this exhibit.

Mr. W. J. GODFREY, Esq., Esmond Nurseries, Devon, showed about seven dozen cut blooms upon boards, in addition to some furnished with longer stems. Several novelties were submitted for certificates, but beyond *Chatsworth*, which was included in several collections, none of these was successful. There were certain very promising varieties however, as *Le Grand Dragon*, a good yellow Japanese; *Mons. Fartzor*, an incurved Japanese, also yellow, with a few forks upon petals; *Louis Dallé*, a Japanese flower with reddish petals, having buff reverse, the reverse being very evident; *Lord Coleridge*, a yellow incurved, but its capabilities could hardly be gauged; &c.

A collection of Chrysanthemum blooms was exhibited by the Dowager Lady FREAKE, Fulwell Park, Slough. The blooms were arranged as triplets in bottles, and were illustrative chiefly of Japanese varieties (*Bronze Banksian Medal*).

A magnificent exhibit of about sixty blooms, representing new English-raised seedling varieties, was shown by Mr. H. Weeks, gr. to Lady BYRON, Thrumpton Hall, near Derby. An Award of Merit was recommended to an excellent Japanese variety named *Mrs. Barkley*, described in a report of the meeting of the National Chrysanthemum Society's Floral Committee on p. 395. There were many very promising varieties in this collection, including *Edith Dashwood*, a tinted Japanese, and many others.

A collection of thirty-six blooms of Japanese varieties from T. B. HAYWOOD, Esq., Woodhatch Lodge, Reigate (gr., Mr. C. J. Salter), was very fine. The exhibit included many novelties, and most of them were represented in their best condition (*Bronze Banksian Medal*).

The incurved varieties were illustrated very finely by an exhibit of numerous varieties from F. W. FLIGHT, Esq., Cornstiles, Winchester (gr., Mr. W. Neville), and an award of a *Silver Banksian Medal* was recommended.

Messrs. CANNELL & SONS, Home of Flowers, Swanley, staged a large number of Chrysanthemums. The exhibit was particularly rich in decorative varieties, including the thread-like section, such as Mrs. Filkins, &c., also many good single-flowered varieties. Messrs. Cannell & Sons

exhibited well-coloured blooms of the Japanese variety Chatsworth (Award of Merit); also of Mdle. Lucie Faure, a fine white incurved Japanese variety. An Award of Merit was also recommended to reflexed variety Charles Jutt; Surpassé Amiral was likewise very good (Silver Flora Medal).

Mr. W. WELLS, Earlswood Nurseries, Redhill, had a very attractive exhibit, filling about an equal space to that previously noticed from Mr. Davis. The Australian-raised Japanese varieties John Pockett and Nellie Pockett, were well shown by Mr. Wells. These popular varieties have been frequently described in these columns. Julia Scaramanga and Beauty of Sholing, a very attractive deep chestnut-coloured decorative variety (Award of Merit) were noticed. A few new and pretty single-flowered varieties were also shown, including Earlswood Beauty, a very large ivory-white-coloured variety, with bright yellow disc (Award of Merit); and Daisy Brett, a pure white flower, of fine form (Award of Merit). Chatsworth (Award of Merit), and Mrs. White Popham were also included in this exhibit (Bronze Banksian Medal).

Sir TREVOR LAWRENCE, Bart., Burford (gr., Mr. W. H. White), staged a small but interesting group, in which all the specimens were remarkable either as being new, rare, or highly-cultivated plants. In the last-named class were two fine *Calanthes*, remarkable for their splendid growth and strong flower-spikes. Of these the new *C. x labrosior*, a fine, large, silvery-white flower, with a slight blush tint on the lip, which had a pale primrose-coloured base, secured an Award of Merit; and for *C. x Bryan*, a well-known hybrid, raised by Mr. N. C. Cookson, having a grand inflorescence of white flowers, with dark claret-coloured centre, the spike rising from a pseudo-bulb 8 inches in circumference, a Cultural Commendation was awarded. Sir Trevor Lawrence also showed for the first time a remarkable hybrid *Dendrobium*, viz., *D. x formoso-Lowi* (*formosum* ♀, *Lowi* ♂), a production which is all the more creditable because neither of the parents is generally a good grower for any length of time, unless very well managed. The flowers of the novelty are exactly intermediate between the two species used in producing it, both in size and colour. The sepals and petals are white with a very faint cream-coloured

Messrs. J. VEITCH & SONS, Ltd., Royal Exotic Nursery King's Road, Chelsea, showed *Oncidium pectorale*, a supposed natural hybrid of the *O. curtum* class. The sepals and petals were yellow, evenly barred with brown, and the lip bright yellow.

J. BRADSHAW, Esq., The Grange, Southgate (gr., Mr. Whiffin), was awarded a Silver Banksian Medal for a pretty group of excellently-grown and well-flowered plants, the specimen of *Cymbidium x Winnianum* with nine spikes of flower which occupied the centre of the group being much the finest of its kind yet seen, and well deserving the Cultural Commendation given. At the end of the group was a very fine form of *Cymbidium Tracyanum*, with rich reddish lines in the sepals and petals, and far finer than any of the importations received after the original appeared; and also conspicuous were two good *Cattleya x Mantini*, a nice example of *Laelio-Cattleya x Apollonia* (*L. purpurata* x *C. Dowiana*), *Cattleya maxima*, some fine *Oncidium varicosum*, *O. tigrinum*, *Sophrontitis grandiflora*, *Odontoglossum Andersonianum*, &c.

Sir WM. MARRIOTT, Down House, Blandford (gr., Mr. Denny), showed *Laelio-Cattleya x Clonia* (*C. Warscewiczii* x *L. C. x elegans*) with light lilac sepals and petals, and dark purple front to the lip. The cross was originally raised by Messrs. Veitch, and flowered in 1894, and now again by Sir Wm. Marriott.

H. F. SYMONDS, Esq., Woodthorpe, Beckenham (gr., Mr. G. Day), showed a group made up of *Oncidium varicosum*, *O. pretextum*, *O. Forbesii*, *O. tigrinum*, *Odontoglossum grande*, *Masdevallia macrura*, *Cymbidium Tracyanum*, *Cypripedium x Lecanum superbum*, *Erenthus Leonis*, *Sophrontitis grandiflora*, &c. (Bronze Medal).

F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, showed flowers of *Masdevallia Veitchiana* "Prince des Galles" (almost wholly orange-scarlet); and *Mormodes Lawrenceana*, a tawny-yellow species of the form of *M. bucinator*, but with hairy lip.

J. T. BENNETT-POE, Esq., Holmewood, Cheshunt (gr., Mr. Downs), showed a splendid six-branched spike of a fine form of *Oncidium tigrinum*, and a fine spike of *Aërides Lawrenceana*.

C. E. HARVEY, Esq., Yardley, Birmingham, sent *Cypripedium Charlesworthii*; J. LISTER GODLEE, Esq. (gr., Mr. John Medcalfe), Whip's Cross, Walthamstow, showed a hybrid *Cypripedium* resembling *C. x T. B. Haywood*; Mr. J. FITT, gr., Trumpet Hill, Reigate, showed a bunch of twin-flowered spikes of *Cypripedium insigne*, showing great vigour; Mr. W. H. HOLAH, Richmond, showed a brown-tinted *Lycaste Skinneri*.

Fruit Committee.

Present: Philip Crowley, Esq. (chairman), and Messrs. A. F. Barron, M. Gleeson, Jas. H. Veitch, J. Cheal, Alex. Dean, J. Willard, J. W. Bates, W. Pope, Geo. Reynolds, Geo. Wythes, Alderman H. Balderson, F. Q. Lane, Jas. Smith, and Robt. Fife.

An Apple, Ballenora Pippin, was recommended an Award of Merit. It is a deep red fruit, in colour similar to that of *Mère de Ménage*, almost equal over the whole surface; medium in size, higher on one side than the other; eye large and open, set in a deep cavity; stem apparently short, stout, set in a moderately-deep, funnel-shaped, russet-coloured cavity. It has a nice soft flesh, and in flavour is somewhat between Blenheim Orange and Cox's Orange Pippin. It would probably be best in October. It was shown by Messrs. R. HARTLAND & SON, Lough Nurseries, Cork, who had another variety of Apple, named Ahern Beauty, very different in form to Ballenora Pippin, but possessing certain characteristics found in that variety.

Seedling Apples were also shown by Sir JOSEPH PULLEY, Lower Heaton, Hereford (gr., Mr. Williams); Mr. A. Ward, gr. to Lady EMILY FOLEY, Stoke Edith Park, Hereford; and Mr. G. RAWLINGS, Pen-y-Van, Whitebrook, Monmouth.

Mr. LEWIS J. DUNBAR, Heath Park Nurseries, Hemel Hempstead, showed ten very large specimens of *No Plus Ultra* Onion.

Artificial Manures in the Garden.

In the afternoon there was delivered a lecture upon the above subject by Mr. A. D. HALL, Principal of the S.E. Agricultural College, Wye.

After a few words of introduction, which had reference to the benefits attending the use of artificial manures in the garden, Mr. Hall went on to say he believed the average gardener had not the necessary knowledge to enable him to buy or use such manures to the best advantage. In this respect it was stated that generally the farmer was far ahead of the gardener. It was a wrong and decidedly expensive practice to use compound (proprietary) manures the ingredients of which are unknown to the purchaser. It is costly because in most instances the price of the compound bears no comparison at all to its value. Neither can any useful experience, said Mr. Hall, be gained from its use. If the plants were benefited, it is not known to which of the ingredients this is due, and the gardener has thereby acquired no knowledge that he can turn to account in the future. It is much better to use simple manures or compounds of them, in the place of all mixtures sold as such, and the results in such case will be useful experience.

In all manures, said the lecturer, there are only three ingredients that are practically useful. These are nitrogen, phosphates, and potash. Dung contains about ½ per cent.

FIG. 113.—KENTIA KERSTENIANA.

(See our issue for November 12, 1898, p. 357, column a, under heading "Messrs. Sander & Co.")

Mr. J. H. WITTY, Superintendent of Nunhead Cemetery, showed a few very curious flowers of Japanese seedlings. One of these, Golden Shower, a flower in which the florets resemble mere threads, and droop around the flower-head about 2 to 3 inches, was recommended an Award of Merit. The florets are gold and red in colour. The variety What Ho, though interesting, was not considered worthy of an award.

Mr. N. MOLYNEUX, gr. to J. C. GARNIER, Esq., Rooksbury Park, Fareham, showed three promising incurveds, named Nellie S. Threlfall (white), Earl of Crawford (silver and light purple), and Golden Gem.

Mr. W. SLOGROVE, gr., Gattton, Reigate, showed a flower of a variety of Japanese *Chrysanthemum* named ina Dabbs, bright yellow, with broad, slightly incurved florets, the flower globular and full.

Orchid Committee.

Present: Sydney Courtauld, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), D. B. Crawshaw, R. Brooman-White, H. Little, A. H. Smee, E. Hill, H. Ballantyne, W. H. White, H. J. Chapman, T. W. Bond, W. H. Young, F. J. Thorne, W. H. Protheroe, and J. Douglas.

shade, and the lip pale yellow on the side-lobes, and white in front, a number of raised hairy lines of a rich orange-brown hue radiating from the base and spreading over the middle area (Award of Merit). Of the two new hybrid *Cypripediums*, the most distinct was *C. x Argo-Morganæ* (*Argus* ♀, *Morganæ* ♂), with bold flowers, the upper sepal being whitish, with some very narrow dark lines; the petals light rose, with very conspicuous chocolate-coloured blotches, and the lip purplish-rose (Award of Merit). The other was an unnamed hybrid of *Cypripedium bellatulum*, with cream-white flower, densely spotted with purple, and having the drooping petals longer than usual, and slightly twisted.

The only species shown was the remarkable new *Cirrhopetalum appendiculatum*, the first to be shown of the class bearing but one large flower on a scape. The flower was about 8 inches in length, the upper sepal white, with three purple lines, and bearing at the apex a long slender purple plume; the petals were also white, with one purple line, and a brush-like plume at the end of each; the thick, tongue-like labellum two shades of bright-purple, and the long lower sepal whitish, with purple marks, and united (or so closely placed as to appear to be so), finishing up in a slender point—a remarkable species from Bengal (Botanical Certificate).

each of these. The chief nitrogenous manures are nitrate of soda and sulphate of ammonia. Phosphates are plentiful in bones and in some guanos. Purely phosphatic manures are basic slag, which may be used upon wet or clay soil, and superphosphates, an ingredient that is not suitable for such soil, but may be used in sandy situations. The lecturer gave the above only as instances of a large number of existing sources.

Proceeding to speak of the uses or effects in use of the three manurial agents, Mr. Hall said that nitrogen stimulates the plant to increased growth. It develops the vegetative forces of the plants, and hinders or defers their maturity. Reference was then made to experiments that have been made at Rothamsted. Grasses that had been continually fed with nitrogen made extraordinary growth, but scarcely a flower can be seen upon them. Their maturity has become so deferred that they have partly lost the habit they possessed of blooming regularly. But in the case of leafy crops, which include most of the Brassicas, nitrogen could be used to much advantage. All nitrogen, before it can be useful to plants, must first become a nitrate, and, as this nitrification proceeds very slowly during cold weather, Cabbages or other such crops in early spring will give a very appreciable response to judicious applications of nitrogen. But Mr. Hall had a word of caution for those who would be likely to apply nitrogen indiscriminately or with too liberal a hand. If the Cabbages are grown in a private garden, and can be at once removed to the kitchen for preparation for the table, the soft fleshy growth in them will be very appreciable; but the market gardener, who must needs despatch his produce many miles before they are sold, which have, therefore, to keep some considerable time before they can be used must be careful. If he gives his Cabbages too much nitrogen, their texture, though suitable for immediate consumption, will result in decay. At Wye it was the case in the spring that the Strawberry plants were showing to bloom prematurely or before a sufficient amount of foliage had been made. In this case nitrogenous manure was given the plants with good effect, as its tendency was to hurry the producing of leaves and to defer blooming.

After stating that ordinary dung was mainly a nitrogenous manure deficient in phosphates, Mr. Hall proceeded to speak of phosphates, and in relation thereto, referred to experiments he had conducted in relation to the manuring of Hops at Marden in Kent. Briefly, these were as follows:—The Hop-fields had been previously manured as are ordinary market gardens. Plenty of dung, wool, and shoddy, had been given the ground, and it is scarcely surprising, therefore, that little or no gain in the crop was effected by using nitrogen compound. A compound gave better results, but the best effect was obtained from the use only of phosphates. The chief effect of phosphates, so far as these can be traced, is to increase the flavour in fruits, the colour in flowers, &c.

Of the remaining manurial element, potash, Mr. Hall had very little to say. It was abundant in clay soil. He frankly confessed that science at present could not say what its exact work or use is. More experiments were needed in the case of potash. When was the best time to use artificial manures to garden crops? Mr. Hall answered the question himself by saying that plants respond to such applications in a much greater degree when they are young. One ounce of nitrogenous manure to a square yard, or 2 cwt. to an acre, Mr. Hall regarded as the "absolute maximum" that should be used. For general crops, about half that quantity would be better. Phosphatic manures being altogether different in two respects, may be used to any degree without injury. They do not waste in the soil, neither will they become available as food in greater quantity than is needed.

FEEDING PLANTS IN POTS.

Artificial manures might be used with ill effects, said Mr. Hall, in the case of plants in pots where the roots are confined in a small area, if care were not used in its application. Some of the guanos are very injurious to the tender roots of the plants. It would be best to mix the manure with the soil some time before using it, that it might mellow down. But sulphate of ammonia and the superphosphates are perfectly soluble in water, and liquid is the best medium in which to supply artificial manures to pot plants. One ounce to a three-gallon can of water would be always sufficient, and half that quantity more usually should be that used.

BEST MANURES FOR CERTAIN CROPS.

It is not known, said Mr. Hall (and this to the surprise of some of his audience), what is the best manure for this or that crop. Before this could be known accurately, there must be systematic and continued experiments, and the results clearly tabulated and compared.

There has been much written, continued Mr. Hall, upon this very matter, plants had been burned and an analysis made of the ash, with a view to proving what the particular crop had abstracted from the soil, and to replacing

these ingredients in the soil by a system of manuring. Such practice and theory is a fallacy. The composition of the ash of a plant bears no part or relation to the manure that it needs to be afforded by the soil. Swedes abstract a great amount of nitrogen from the soil, but what farmer thinks of making nitrogen his principal manure for Swedes? asked the lecturer.

THE DISCUSSION.

Mr. A. DEAN appeared to dissent from many of the remarks made by Mr. Hall. He did not agree that dung was of little value. It was, and would remain, the principal factor in our manurial system. He referred to experiments that had been made in Surrey, and to the absolutely negative results that had followed the use of phosphates; but this was explained later by Mr. Hall, who said that the insufficient rainfall during the past summer would tend to this, and the sandy soil of Surrey was peculiarly unsuitable for experiments with phosphates.

Mr. BERRY, Sittingbourne, Kent, complained that he had come to hear the lecture, and Mr. Hall had told him nothing, evidently referring to the absence of special advice as to the best manures for different crops. He somewhat startled the audience by saying that his practice was to mix all sorts of manures, compounds and others together, and use this mixture of mixtures for most crops.

Dr. MASTERS, F.R.S., who followed, condemned the practice of such quackery, and complimented Mr. Hall upon the lecture he had delivered, and urged gardeners to follow the advice that had been given them to make experiments for themselves in regard to the different crops in their own gardens, rather than trust to analyses made for abstract purposes, but which required modification in practice in order to meet the complex conditions met with in cultivation.

NEWCASTLE & DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT.

NOVEMBER 8.—The usual meeting of this society was held at 25, Westgate Road, on the above date. Mr. Bullock presided over an attendance of nearly forty members.

The Certificate offered for best six Japanese Chrysanthemums was won by Mr. Farquharson, gr. to R. O. LAMB, Esq., Denton, who staged six superb blooms of V. Morel, W. H. Lincoln, Lady Byron, Boule d'Or, Madame M. A. de Galbert, and Chas. Davis. There were six entries. A discussion on the Chrysanthemum, introduced by a very practical paper by Mr. Pettifer, The Cedars, Low Fell, then took place, in which many took part.

BIRMINGHAM CHRYSANTHEMUM.

NOVEMBER 8, 9, 10.—This annual show, which was held at Bingley Hall, Birmingham, on the above dates, was of a most successful character, both in regard to the class of exhibits, and also the attendance of the public.

The accountants have now completed the returns of the attendance of the public, and during the three days it is gratifying to note that independent of subscribers' tickets no fewer than 23,445 of the public paid for admission. It is quite evident that the Birmingham public are fast looking upon their Chrysanthemum show as being one of the events of the year. The arrangements made for the show reflect the greatest credit upon the committee of the Birmingham Chrysanthemum Society.

At the conclusion of the show, the magnificent collection of fruit exhibited by the Queen was distributed among the hospitals of the city, in accordance with her Majesty's command. The Lady Mayoress apportioned the fruit among the institutions according to the number of their inmates, and the distribution was carried out by the president of the show (Mr. Latham), the vice-president (Mr. Pope), and one of the secretaries (Mr. Hughes). The liveliest interest was taken in the distribution by the patients and officers of the hospitals, and the Queen's gift created great satisfaction throughout the wards. The idea of presenting the fruit to the hospitals emanated directly from Her Majesty, and caused so much pleasure that the officials of the show contemplate starting an entirely new class next year, offering prizes for exhibits on condition that they are afterwards given to the hospitals. This year, indeed, one or two exhibitors followed Her Majesty's example. The Queen's exhibits consisted of a large quantity of Pine-apples, Grapes, Plums, Apples, Pears, and other kinds of fruit. Some of the Grapes were grown at Hampton Court, on the "big Vine," which is 130 years old, and this year bore 1½ ton of fruit. The rest of the fruit was grown at Frogmore. Her Majesty's Head Gardener, Mr. Owen Thomas, was at the Birmingham show throughout.

SOCIÉTÉ NATIONALE D'HORTICULTURE DE FRANCE.

NOVEMBER 9 to 14.—There was a fine display of Chrysanthemums in Paris on the occasion of an exhibition by the above society. It was opened on November 9, and was held in the Jardin des Tuileries.

The show itself was in a large tent. Handsome groups of Chrysanthemums, mingled with Bambusa, Euonymus, Laurels, &c., lined the sides whilst in the body of the tent

as a relief to the colours of the Chrysanthemums, some fine specimens of Phoenix canariensis, Chamaerops excelsa and humilis, in tubs 8 to 12 feet high, were introduced to great advantage. Japanese varieties, reflexed types, were in considerable numbers, and Anemones, Pompons, and single-flowers were well represented.

The competition was very great, especially in Japanese varieties. Cyclamens, winter-flowering Carnations, Begonias, and Orchids, were shown in praiseworthy condition. Apples, Pears, Grapes, were very well represented, and most of the competitive stands were tastefully arranged. There were also very odd collections of fruits and vegetables. In the open air, well-trained fruit-trees, palmettes, cordons, standards, &c., were planted out, and also very fine specimens of Magnolia grandiflora, Euonymus, and many other hardy evergreen shrubs were shown.

Amongst the principal exhibitors were Messrs. Vilmorin, Andrieux & Co., Paris, A. M. Lemaire, August Nonin, M. Yvon & Sons, M. Salomon, Messrs. Pallerand Brothers, M. A. Bruneuse, E. Rossette, W. Wells (Earlswood, England), Alexandre Regnier, M. Croux & Sons, E. Bert, Vallerien Brothers, R. Truffaut, &c., &c.

WELLINGBOROUGH CHRYSANTHEMUM.

NOVEMBER 11, 12.—The fourteenth annual show of the above Society, held on the above dates, was decidedly the best that has yet been held at Wellingborough. The groups were not so good as they have sometimes been, but this was more than counterbalanced by the excellence of the cut blooms and of the fruit exhibits.

For a collection of plants, Mr. WARD was placed 1st; and also for four distinct trained plants, and the best specimen plant.

Mr. J. S. HAYES, Castle Ashby Gardens, Northampton, was most successful in the class for twenty-four Japanese and incurved blooms, and for twelve Japanese blooms. Mr. KIBBY, Northampton, had the best incurved; and Mr. HAYES, the best twelve white Chrysanthemums.

In the amateurs' classes, which were well contested, Mr. WARD was the chief winner.

The open class for Apples was won by Messrs. H. & E. JACK. Mr. LATIMORE had the best Grapes; and Mr. J. T. HAYES the best collection of eight kinds of vegetables.

Through the energy of the Secretary, Mr. Lilley, and the committee, the show is gradually gaining in popularity. H. K.

BRADFORD CHRYSANTHEMUM.

NOVEMBER 11, 12.—The twelfth show in connection with the above flourishing Society was held in St. George's Hall. The large groups of plants were arranged down the centre of the hall, and three excellent ones were shown of Chrysanthemums only.

Dr. HY. SMITH, Granville House, was the best exhibitor, followed by Mr. L. SHEARMAN, Undercliffe Cemetery.

The best group of miscellaneous plants was from Messrs. J. W. MOORE & Co., Ltd., Rawdon.

Cut flowers were well shown. For twenty-four Japanese blooms, Mrs. MASON, Bankfield (gr., Mr. Midgley), was 1st, and his stand included many fine specimens; 2nd, W. H. TATE, Esq., Woolton, Liverpool (gr., Mr. G. Haigh).

The best collection of twenty-four incurveds was from G. B. COCKBURN, Esq., Birkenhead; 2nd, W. H. TATE, Esq., Woolton. J. B. COCKBURN, Esq., had the best exhibits of twelve incurveds; and Mrs. MASON, Bankfield, the best collection of twelve Japanese blooms.

Plants.—Some pretty specimens were shown. The best collection of six table plants was shown by H. GOODALL, Esq., Pudsey; and the best six Primulas by T. ARTON, Esq., Rawdon.

Fruit.—Mrs. MASON, Bingley, had the best exhibit of two bunches of black Grapes. A tray of fine vegetables was shown by Mr. KNOWLES, Moorhead, Shipley.

DEVIZES CHRYSANTHEMUM.

NOVEMBER 15.—The annual Chrysanthemum Show, held in connection with the Devizes Benevolent Society, took place in the Corn Exchange on the above date, and was the means of bringing together some flowers of very high quality. A bazaar is held in connection with it, and the proceeds are devoted to charitable purposes. The arrangements of the show were carried out by Mr. Thomas King, of The Castle Gardens, and they were all that could be desired.

There were six stands of twenty-four incurved varieties, and though the stands all had commendable flowers, some blooms were wanting in finish. There was a very good stand indeed from Mr. J. Dumble, gr. to Sir CHARLES E. G. PHILLIPS, Bart., Picton Castle, Haverfordwest, the flowers being of large size, even, well built, and fresh. Mr. C. J. SALTER, gr. to T. B. HAYWOOD, Esq., Reigate, was 2nd, with a good stand, fresh, well developed, but lacking the size of those in the previous stand.

Mr. SALTER was 1st with twelve blooms of incurved varieties, having a good even exhibit; 2nd, Mr. W. Robinson, gr. to the Right Hon. Lord Ludlow.

The best collection of twenty-four Japanese blooms was a very fine one, including large, full, and well-balanced blooms, from Mr. F. S. VALLIS, Bromham Fruit Farm; 2nd, Mr. C. J. SALTER.

Mr. VALLIS had the best twelve incurved Japanese, showing,

in fine character, Mrs. W. H. Lees, Lady Ridgway, Graphic, Western King, and Modestum. 2nd, Mr. C. J. SALTER, who had very good blooms.

The best twelve Japanese from exhibitors living in Wilts only were shown by Mr. H. CLACK, gr. to Col. E. COLSTON, M.P., Roundway Park, who had fine flowers. Mr. W. ROBINSON was 2nd.

The best twelve Anemones came from Mr. H. CLACK, a very fine lot of blooms. 2nd, Mr. SALTER.

The best group of sixty plants of Chrysanthemums came from Mr. H. CLACK, who showed well-grown and flowered examples, edged with foliated plants, and forming a bold and striking feature in the centre of the hall. 2nd, Mr. W. Mantell, gr. to Col. DUNN, Rowdeford.

In the class for a basket of autumn foliage and berries, over twenty were staged, the 1st prize being won by Miss MABEL BROOKS. These proved a very attractive feature, and occasioned much local interest.

A stand of twelve very pretty varieties of Pompon Chrysanthemums was staged by Mr. SALTER, and was Highly Commended.

THE LOUGHBOROUGH AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

NOVEMBER 15.—A fortnightly meeting was held on the above date, when a prize essay was read upon "The Cultivation of the Cyclamen," by Mr. A. Hamshere, jun., of Beau Manor Gardens. The essayist lucidly described the details of cultivation by referring to seed-sowing and potting the plants, and the necessary treatment subsequently, stating that the plants should flower in about fifteen to eighteen months from the date when the seed is sown.

The room was made very bright and attractive by a display of Chrysanthemum blooms, set up by Messrs. SMITH & SON, Derby Road Nurseries. They had ten dozen Japanese blooms in forty varieties, and thirty-six incurved blooms in twenty-four varieties. Mr. H. WEEKS, of Thrumpton Hall Gardens, staged a fine exhibit of twelve blooms of his own seedling varieties. Mr. Reynolds, gr. to W. B. PAGER, Esq., exhibited four pots of Chrysanthemum Mons. C. de Leché, late-struck plants.

GREAT YARMOUTH CHRYSANTHEMUM.

NOVEMBER 15, 16.—The eleventh exhibition of this flourishing Society was held in the Drill Hall on the above dates, the exhibits of specimen plants and cut blooms fully maintaining the high quality hitherto obtained by this Society. Good and not over-trained plants were forthcoming in numbers sufficient to make a bank on both sides of the hall.

With six plants of Japanese, Mr. JAMES SUTTON, Telegraph House, Yarmouth, was 1st, with well-flowered specimens; 2nd, Mr. FOULSHAM; and for six incurved plants, Dr. DUDLEY was 1st; 2nd, Mr. SUTTON. Dr. DUDLEY was also 1st for three very fine plants of single-flowered varieties, and for three reflexed.

The principal class for cut blooms was that for thirty-six Japanese, distinct varieties, and of these there were five exhibits, Mr. HANSON, gr. to Sir SAVILE CROSSLEY, Somerleyton, Lowestoft, winning the 1st place somewhat easily with good stands of large and fresh flowers.

For twenty-four Japanese blooms, H. S. H. LACOW, Esq., Ormesby Hall (gr. Mr. Topham), was 1st, with a stand of bright flowers; 2nd, Mr. W. R. SEAGO.

For a similar number, open only to those residing within the borough of Great Yarmouth, and for which a handsome Silver Cup was offered by the Corporation for the 1st prize, the competition was keen. The Cup was won by Mr. SUTTON with an excellent stand of blooms.

A fine stand of twelve varieties from Mr. Atkinson, gr. to E. S. TRAFFORD, Esq., Wroxham Hall, Norwich, was easily 1st; and this exhibitor was also to the fore with a similar number of incurved varieties.

Mr. Topham, gr. to H. S. H. LACOW, Esq., was 1st with twenty-four incurveds in a strong competition; 2nd, Mr. HANSON.

Reflexed, Anemone, and single-flowered varieties were also contributed by numerous exhibitors. A grand stand of six blooms of one variety (Japanese) was staged by Mr. W. SEAGO, the variety being Mrs. J. Lewis.

Fruit was shown well by many exhibitors, as also were miscellaneous plants and floral decorations; while quite a feature of the exhibition was the wonderfully fine vegetables staged in ten classes for special prizes offered by Messrs. I. BRUNNING & Co., of Yarmouth. The last-named firm also contributed largely with non-competitive exhibits of Chrysanthemums and miscellaneous plants.

THE CHESTER PAXTON FRUIT AND CHRYSANTHEMUM.

NOVEMBER 15, 16.—The Chester Paxton Society's annual show of fruit and Chrysanthemums was held on the above dates in the Assembly Room of the Town Hall. Since its establishment nine years or so ago the Paxton Society has so stimulated the enthusiasm of local horticulturists that there has been as a consequence a wonderful improvement in the culture of fruit and Chrysanthemums, until at the present time the standard of quality in both fruit and flowers approaches perfection.

The advance in local fruit-growing is demonstrated by the fact that whereas at previous shows the prizes largely went to North Wales, this year they were almost entirely awarded to exhibitors in the locality. The entries of both fruit and Chrysanthemums exceeded those of former exhibitions. Last year about 1000 dishes of fruit were shown, but at this show there were over 1800 dishes.

The most striking of the floral exhibits were groups of Chrysanthemums arranged for effect in the centre of the room. Mr. J. WYNN FROULKES, of Upper Northgate House, has carried off the prize in this section during the past two years, but on this occasion he had to give place to Mrs. HUDSON, Bache Hall (gr. Mr. Stubbs), whose exhibits for wealth of bloom and tasteful arrangement left nothing to be desired.

Competition was keen in the section for cut Chrysanthemum blooms. The principal prize was for the best twelve cut blooms of distinct Japanese varieties; and out of fifteen competitors, the 1st and 2nd prizes were secured by Mr. F. A. POTTS, Horsley Hall, Gresford, and Lord TREVOR (gr. Mr. Dawes).

For the best-arranged eporgne of cut Chrysanthemums, Mr. T. BROCKLEBANK, Heswall, was placed 1st out of five entries; and Mrs. HUDSON 2nd. A new departure this year consisted in prizes for the premier blooms in the whole exhibition. In the Japanese blooms Lord TREVOR won champion honours, and carried off the Silver Medal with a beautiful specimen of the C. Harman Payne variety; while in the incurved blooms, Mr. J. TOMKINSON took the chief honours and the Silver Medal for an exquisite pale yellow Globe d'Or.

FRUIT.

The fruit section comprised some magnificent Apples, Pears, and Grapes. The Grapes were not quite so strong as a whole, but nevertheless some excellent bunches were shown. CHARLES WIGG, Esq., Hoole Bank, was to the fore for white bunches; EDWARD DIXON, Esq., Littleton Hall, and Sir GEORGE MEYRICK, Bart., taking 2nd and 3rd prizes. Mr. WIGG also took 1st prize for two bunches of black Grapes; while Mrs. POCHIN (gr. Mr. J. Sanderson), Bodnant Hall, occupied a similar position in the class for four black bunches. The class which excited most interest in the fruit section was that for fifty dishes of Apples, Mr. JOHN WATKINS, Wilmington, Hereford, carrying off first honours against four other competitors.

In the class for that old favourite and queen of dessert Apples, Ribston Pippin, there were twenty-five competitors, and it was pleasing to note that the 1st and 2nd prizes were carried off by local exhibitors in the respective persons of the Rev. L. GARNETT, Christleton Rectory, and E. DIXON, Esq., Littleton. In the class for Cox's Orange Pippin, Mrs. TOWNSEND-INGE, of Christleton Hall, took 1st prize. In the other classes for dessert Apples, the chief winners were Mrs. C. DAY, Rowton; Mrs. POCHIN, and Lord DELAMERE.

In the class for six separate dishes of dessert Apples, the Rev. L. GARNETT carried off the 1st honours; and Mr. B. C. ROBERTS was 2nd.

The class for twelve dishes of kitchen Apples drew an entry of eight, against three last year; Lord COMBERMERE took the 1st prize, and Mrs. POCHIN the 2nd.

No fewer than twenty competitors entered some of the classes for single dishes of kitchen Apples, and many of the exhibits were of great excellence. Excellent dishes of Alfriston, Blenheim Orange, Lane's Prince Albert, and other sorts were also shown.

Close upon sixty competitors entered the classes for dessert Pears, and here, as in previous years, local growers were well to the front. Mrs. AMBROSE DIXON, Christleton Bank, took 1st prize for the Marie Louise variety, and the Rev. L. GARNETT gained similar honours with a magnificent dish of Pitmaston Duchess, and also with his entry of Doyenné du Comice.

The Duke of WESTMINSTER sent, not for competition, by his head gardener, Mr. N. Barnes, a splendid collection of hardy and indoor fruits, consisting of Melons, Grapes, Apples, Pears, the table on which they were displayed being beautifully set off by Crotons, cut blooms of Chrysanthemums, Hyacinths, Violets, Cyclamens, &c. The judges unanimously awarded it a Silver Medal.

Messrs. DICKSON sent, not for competition, a beautiful collection of choice greenhouse-plants, consisting of Palms, Bamboos, and Chrysanthemums, which were tastefully arranged at the lower end of the room. They also made a capital display of hardy fruits from the nurseries.

BRIGHTON.

NOVEMBER 15, 16.—This was a good show, and if some of the fruit and cut flowers were not quite so excellent as they have sometimes been here, there were no really bad ones. The arrangements are always good at the Dome and Corn Exchange, and with such an experienced committee and secretary, Brighton show is likely to continue to be successful.

The best groups of plants came from Mr. G. MILES, Dyke Road Nursery; Mr. ANDERSON, and Mr. HEAD, The Drive Nursery, who secured 1st honours in their respective classes. Cyclamens were very good, especially those from Messrs. W. MILES & Co., Church Road, Hove.

Another special feature were vases of Chrysanthemums only. Mr. H. HEAD was 1st in the class for three vases, five flowers in each.

The cut flowers were not so good as usual. Some of the best were found in a stand from Mr. G. PIGOTT, 37, Trafalgar Street, who won the Challenge Trophy for flowers grown within three miles of the Pavilion.

Tables of cut flowers and foliage plants brought good competition, and here Mr. G. MILES, Dyke Road Nursery, just got ahead of Mr. H. HEAD, from The Drive Nursery.

Specimen blooms were poor; the two best came from Mr. Harris, gr. to Colonel HENTY, Arundel, and the next best from J. HICKSON, gr. to F. SLATER, Esq., Newick.

A grand non-competitive exhibit from Messrs. BALCHIN & SONS, Hove and Hassocks, gained the Society's special Gold Medal.

WINCHESTER CHRYSANTHEMUM.

NOVEMBER 15, 16.—The horticultural society in the city of Winchester may be congratulated on the fine autumn exhibition held in the Guildhall, it being much the best of the sixteen preceding ones. The cut blooms were of exceptional merit, and the plants, fruit, and vegetables likewise.

Plants.—Groups of Chrysanthemums were a strong feature. Mr. G. H. STREET, gr. to Rev. Dr. FEARON, The College, Winchester, was awarded the premier prize for an exhibit, good in every respect.

Instead of offering prizes for huge trained specimen plants, the committee encourage the growth of decorative plants. For eight plants, there was keen competition. Mr. G. COUSINS, gr. to E. H. BUCKLAND, Esq., Kingsmead, Winchester, won the leading prize with suitable examples. Mr. H. GRIGG, gr. to Rev. MOORSON, Holyrood, Winchester, had the best six white and six yellow-flowered varieties.

Groups of miscellaneous plants were very well shown, Mr. Carr, gr. to W. A. GILLET, Esq., Fair Oak Lodge, Bishopstoke, winning the leading prize with a tastefully-executed group, mainly of seasonable Orchids.

Cut Blooms.—Forty-eight distinct varieties, half Japanese and the remainder incurveds, formed the principal class, and produced keen competition. Mr. NEVILLE, gr. to F. W. FLIGHT, Esq., Twyford, Winchester, was an easy winner, with a remarkable stand of incurved blooms, and good specimens of Japanese. Mr. J. WASELEY, gr. to F. B. TAYLOR, Esq., Sheffield Manor, Basingstoke, won the premier award for twenty-four Japanese blooms. Mr. NEVILLE won the 1st prize for twelve incurveds in four varieties, three blooms of each, and also for twelve varieties in both classes, staging creditably.

An interesting class was that for twelve Japanese blooms in four varieties, three blooms of each, all to be white-flowered kinds. Mr. J. WASELEY was 1st with a pleasing exhibit of such varieties as Mutual Friend and Simplicity. In a similar class for twelve yellow or bronze flowering, Mr. WASELEY again secured the leading award.

Non-competitive Exhibits were not numerous. Messrs. E. HILLIER & SON staged a nice collection of Apples, and Messrs. JARMAN had a somewhat smaller exhibit. Mr. N. MOLYNEUX, Rooksbury Park, Fareham, had a number of blooms of seedling varieties of Chrysanthemums.

RUGBY AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 15, 17.—The twelfth annual exhibition was held on the above dates, and was a great improvement upon previous ones. The cut blooms were very fine, especially those from ARTHUR JAMES, Esq. (gr. A. Chandler), Cotton House, Rugby, which were among the best we have seen staged this season.

PLANTS AND GROUPS.

For a group of Chrysanthemums arranged with Ferns, foliage plants, and Primulas for effect, Mr. BENNETT (gr. Mr. Wayman), The Firs, Rugby, was 1st, with a circular group, having a plant of Cocos Weddelliana in the centre, with Chrysanthemums, Cordylines, Ferns, Ophiopogons, &c.

The local group class was won by Mr. CALDICOTT (gr. Mr. Robinson), The Lodge, Rugby, who had a semi circular arrangement of some merit.

For four Chrysanthemum plants of distinct varieties, Mr. CALDICOTT was again 1st, with specimens of Source d'Or, Vivand Morel, Edwin Becket, and Chas. Davis.

Two competitors staged for the prize for twelve Primulas (open), ARTHUR JAMES, Esq., Cotton House, Rugby (gr. Mr. A. Chandler), being a good 1st, with well-grown, fresh plants of the old double white variety, full of bloom.

CUT BLOOMS.

There were three competitors for twenty-four Japanese (distinct), but ARTHUR JAMES, Esq., Cotton House, Rugby (gr. Mr. A. Chandler), was an easy 1st, having some magnificent blooms, the only weak one being a specimen of Mons. Hoste. The collection included Mr. J. Burks, Mrs. W. Mease, Lady Ridgway, Mons. Chenon de Leché, and W. Wright. The 2nd place was occupied by S. SODER, Esq., Floore House, Wedon (gr. Mr. W. Pearce).

ARTHUR JAMES, Esq., was again 1st for eighteen Japanese blooms, and for twelve Japanese blooms.

For twelve incurved also, ARTHUR JAMES, Esq., was 1st having a beautiful and even lot of flowers.

For twelve Japanese blooms (local), E. EDWARDS, Esq., Horton Crescent, Rugby (gr. Mr. Mackay), was 1st, and showed creditably.

FRUIT AND VEGETABLES.

Fruit was very good, especially the Grapes. For two bunches of Grapes, ARTHUR JAMES, Esq., was 1st, with two even, well-coloured bunches of Muscat of Alexandria; and A. P. MUNTZ, Esq., Dunsmore, Rugby (gr. Mr. Blackenway), was 2nd with Black Alicante.

For four dishes of Apples (Dessert), The Earl of DENBIGH, Newham Paddox, Lutterworth (gr., Mr. W. Harrison), was 1st, with good examples; and Mr. PEARCE was 2nd. The Earl of DENBIGH had also the best collection of four dishes of culinary varieties.

Lord SPENCER, Althorp Park, Northampton (gr., Mr. Coles), led the way for four dishes of Pears, and staged capital specimens.

The best collection of eight varieties of vegetables was from the Earl SPENCER; and P. A. MUNTZ, Esq. (gr., Mr. Blakenway), was 2nd.

MISCELLANEOUS EXHIBITS.

For table-decoration, Mr. ROBINSON, Farm Cottage, Rugby, was placed 1st.

A stand was erected for the sale of fruit and flowers, in aid of the Gardeners' Orphan Fund, and a sum of £7 was thus obtained.

Messrs. B. HURST & SON, nurserymen, Hinckley, had about forty dishes of well-grown Apples. H. K.

LEEDS PAXTON SOCIETY.

NOVEMBER 15, 16.—The annual show of this Society was held in the Victoria Hall, Leeds, on the above dates. The following were the chief awards made to a number of excellent exhibits, among which the groups of Messrs. TOWNSEND and PETTINGER were exceptionally fine.

GROUPS (OPEN).

For a miscellaneous group, Orchids being allowed, E. B. FABER, Esq., Belvedere, Harrogate (gr., Mr. Townsend), was 1st, with a very choice and tastefully-arranged group, including in the foreground some very nice Orchids, including some fine spikes of *Oncidium varicosum* Rogersii, the chief attraction of the group; 2nd, J. C. GOODALL, Esq., Pudsey, near Leeds; 3rd, Sir JAS. KITSON, Bart. (gr., Mr. Grix); the latter was exceedingly light and graceful, and seemed to be generally considered an easy 2nd.

Group of Chrysanthemums, 1st, Mr. J. PETTINGER, Harrogate, with a grand lot of plants, furnished with fine large flowers, and the group was nicely arranged; Mrs. TETLEY, Fox Hill, Westwood (gr., Mr. J. Eastwood), was the winner of the 2nd prize.

OPEN CLASS.

For twenty-four Chrysanthemum blooms, incurved, the Earl of HARRINGTON, Elvaston Castle (gr., Mr. J. Goodacre), was 1st, with a stand consisting of very fine flowers.

In the next largest class, that for twenty-four Japanese, in not fewer than eighteen distinct varieties, R. A. BOWRING, Esq., The Heath, Cardiff (gr., Mr. Joy), was 1st; this was a fine exhibit, and included grand blooms. The Earl of HARRINGTON's gardener was 2nd, as he was likewise for twelve incurved; whilst Mrs. WHITTAKER, The Cliffe, Hesse, was 2nd.

P. CLARK, Esq., Rodley, Leeds, had the best twelve Japanese, distinct; and Mrs. MASON, Bankfield, Bingley, the 2nd best.

The best basket of Chrysanthemums, with foliage, came from Mrs. WHITTAKER, Cliffe, Hesse.

The remainder of the exhibits consisted of a number of minor classes, in which the Chrysanthemum in various sections figured; table plants, Roman Hyacinths, Grapes, both black and white varieties; and non-competitive ones, from Messrs. HARKNESS, of Bedale; and R. P. K&R & SONS, Liverpool.

WARGRAVE AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

NOVEMBER 16.—A fortnightly meeting of the above Society was held on Wednesday evening, November 16, but owing to counter attractions, the attendance was smaller than usual.

Mr. W. POPE presided, and read a paper on Calanthes. He confined his remarks to the deciduous species, and gave full cultural directions for their successful growth. A vote of thanks was accorded to Mr. Pope for his instructive paper. A discussion took place on Calanthes generally, and the group exhibited by the chairman was much admired. It consisted of *C. Veitchii*, *C. vestita rubro-oculata*, and *C. vestita lutea oculata*. A number of cut blooms of Chrysanthemums was also staged. H. Coleby, Hon. Sec.

TEIGNMOUTH GARDENERS' MUTUAL IMPROVEMENT.

NOVEMBER 16.—The annual exhibition was held in the Assembly Rooms, and was in every respect a very satisfactory show.

In the class for twelve Japanese and twelve incurved the competition was keen, the blooms being fresh, large, and full. The 1st prize was awarded to H. HAMMOND SPENCER, Esq. (gr., Mr. G. Foster). For Japanese blooms distinct, J. PHILIPS, Esq. (gr., E. Atkins), was 1st with a stand of very fine blooms. For nine specimen blooms, cut with not less than 12 inches of stem and foliage to be shown, three blooms in a vase, H. HAMMOND SPENCER was 1st.

Groups were good, the premier position being secured in one class by J. PHILIPS, Esq., whose plants were not more than 4 feet high, but the flowers were large and bright, and the foliage clean. In another class for groups arranged in a circle 7 feet in diameter, Mrs. PARSONS (gr., Mr. J. Beer) was placed 1st. With six blooms of one variety, H. HAMMOND SPENCER was again well to the fore with grand blooms of G. J. WARREN.

There were numerous additional classes for cut blooms, and they were well contested. The beauty of the incurveds being specially noticeable.

Primulas and table plants were good, but not so numerous as in previous years.

For a collection of twelve sorts of Apples, six dessert and six culinary, Mrs. ELMS was 1st, there being several other good exhibits of Apples and Pears. Vegetables in collections were of good average quality.

HULL CHRYSANTHEMUM.

NOVEMBER 16, 17.—This Chrysanthemum Society held the best exhibition it has had in the Artillery Barracks of this town on the dates named. Both in groups and cut blooms there was a marked improvement on former years.

Cut Blooms formed a prominent feature, being shown in quantity, and of great merit.

For twenty-four incurved, in not fewer than eighteen varieties, there was a grand display, and Mr. G. CROOKES, gr. to Lady HINDLIP, Hadsor House, Droitwich, took the premier position somewhat easily with a magnificent collection; and Mr. W. MEASE, gr. to A. TATE, Esq., Downside, Leatherhead, was a good 2nd.

For eighteen incurved varieties, Mr. P. WALKER, gr. to Colonel CLITHEROW Hotham House, Brough, was decidedly a good 1st: the Japanese blooms were much admired; and in the class for twenty-four, Mr. MEASE was placed 1st with grandly-developed examples; and Mr. J. P. LEADBETTER, gr. to A. WILSON, Esq., Tranby Croft, Hull, took the 2nd place.

In the class for eighteen, Mr. J. BACKHOUSE occupied the leading position; and in the class for twelve, Mr. J. DOWN was 1st, both cultivators showing very creditably.

For six blooms, any one variety, Mr. T. WALKER, with M. Chenon de Leche, was 1st in a stiff competition.

Anemone-flowered varieties were so well shown, that they deserve a special mention, Mr. F. MASON, Hesse, winning the 1st place with a number of full-centred blooms of W. W. Astor, Sir W. Raleigh, Queen Elizabeth, and Enterprise.

Single-flowered varieties were capitally represented by Mr. Waterhouse in the twelve-bunch class.

Groups of Chrysanthemums and Foliage Plants were meritorious, and the principal award—a Silver Challenge Vase and a money prize—was taken by Mr. G. Wilson, gr. to Sir J. RECKITT, Bart., Swarland Manor, Brough, with a group which left little to be desired; Mr. G. Jarvis, gr. to Mrs. WHITTAKER, Cliffe House, Hesse, being the winner of the next best.

Mr. J. W. WILSON was 1st in the class for a group of miscellaneous plants. Decorated mirrors formed a special feature at this show, and the exhibit of Mr. G. C. COATES, gr. to W. WHEATLEY, Arlaby Road, Hull, was adjudged the best in design, and that of Mr. LEADBETTER the next best.

Plants were staged numerous and well. For three specimens Mr. H. THOMPSON, gr. to C. J. RINGROSE, Esq., Cottingham Grange, Hull, was far ahead of others, with profusely-flowered examples of the Rundle type of Chrysanthemum. Standard-trained plants were equally finely shown, each plant in the winning group carrying four dozen shapely blossoms, and here Mr. Thompson secured the highest award.

"Cut-back" plants, so useful for conservatory decoration, form a feature of the show, and for six of them Mr. J. BACKHOUSE was 1st, with plants having abundant foliage and fully developed blooms, of such varieties as Mutual Friend, Charles Davis, Vivian Morel, and Phœbus.

BRISTOL CHRYSANTHEMUM.

NOVEMBER 16, 17, 18.—In consequence of the recent destruction of a portion of Colston Hall by fire, this society held its twenty-fifth exhibition in the spacious Drill Hall. The exhibits, generally, were of much merit; although the exhibits in the chief classes for cut blooms were not so numerous as previously. Groups of plants were good, and fruit and collections of vegetables better than usually seen at Bristol.

PLANTS.

The best group of Chrysanthemum plants among four exhibitors came from J. DOLE, Esq. (gr., Mr. J. Marshall), who had a capital exhibit; the 2nd prize being won by J. C. GODWIN, Esq. (gr., Mr. G. McCulloch).

In the class for Chrysanthemums, arranged with ornamental foliage plants, there were three nice exhibits, the best being from H. ST. VINCENT AMES, Esq. (gr., Mr. W. H. Bannister); W. E. GEORGE, Esq. (gr., Mr. A. Ross), was 2nd.

There were only two exhibitors in the class for a group of miscellaneous plants. J. SANDERS, Esq. (gr., Mr. Newberry), was 1st with a bright, tastefully-arranged group of plants, consisting chiefly of *Cattleyas*, *Cypripediums*, *Dendrobiums*, *Oncidium*, *Palms*, and *Codiaeums*, edged with *Adiantum* Fern.

Cut Blooms.—For thirty-six blooms, Japanese, in not fewer than twenty-four varieties, the society's challenge vase and 1st prize was won by Mr. G. W. DRAKE, Cardiff, who had a collection of large, full blooms. His leading varieties were: Mrs. J. Lewis (a grand flower, which was awarded the National Chrysanthemum Society's Silver Medal, being the best bloom in the show), Miss M. Molyneux, G. J. Warren, and M. Chenon de Leche (two blooms). 2nd, R. WHITEHEAD, Esq. There were seven exhibitors.

The best collection of twenty-four blooms, incurved, was from Sir C. E. G. PHILLIPS, Bt., Picton Castle, Haverfordwest (gr., Mr. J. Dumble), who had remarkably good and

even flowers. Amongst his best were: Madame Ferlat; Lady Isabel, Miss D. Foster, C. H. Curtis, Queen of England, Middle L. Faure, Bonnie Dundee, Globe d'Or, and Golden Empress. 2nd, R. WHITEHEAD, Esq. (gr., Mr. Runnacles).

Twelve blooms, Japanese, were best from Mrs. H. A. SMITH, Chepstow (gr., Mr. H. Baker); 2nd, Mr. H. A. ALLEN, Penarth. And the best collection of twelve incurveds were also from Mrs. H. A. SMITH.

Twenty-four blooms, Japanese, eight distinct varieties, three of each, arranged with foliage of any kind, in a space 4 feet by 3 feet. W. PETHICK, Esq. (gr., Mr. S. W. E. Hack), was 1st in this class, and showed good blooms of leading varieties, intermixed with sprays of *Asparagus*, *Codiaeums*, and fronds of Ferns; 2nd, J. DOLE, Esq. R. WHITEHEAD, Esq., had the best dozen blooms of a Japanese variety, showing Madame Carnot.

For six Japanese blooms, distinct, of varieties sent out in 1897 or 1898, Lady T. GUEST (gr., Mr. Wilkins) was 1st, showing Lady Ridgway, Louis Bechmer, N. C. S. Jubilee, Vicomte Roger de Chezelles, and Lady Hanham; 2nd, Mr. DRAKE.

FRUIT.

Twenty classes were devoted to fruit, which chiefly consisted of Grapes, Apples, and Pears. There was spirited competition in most of these. The best collection of fruit (six dishes) was from Mr. WILKINS, who had good Muscat and Gros Maroc Grapes, King of the Pippins Apple, and Pit-maston Duchess Pears; Mr. Warren, gr. to T. JONES, Esq., Bath, was 2nd.

Eight bunches of Grapes, in not fewer than four varieties. The chief prize in this class consisted of £5 and the Veitch Memorial Medal, and was deservedly awarded to Mr. Coote, gr. to D. E. TAYLOR, Esq., Marshfield, for a very good exhibit. Mr. COOTE, with Muscat of Alexandria, also in this class, won a special prize for the best bunch of Grapes in the show. 2nd, Mr. W. Taylor, gr. to C. BAYER, Esq., Streatham.

The best collection of six dishes of dessert Apples was from Mr. G. RUNNACLES; Mr. BANNISTER being a good 2nd. For six dishes (culinary) Mr. Aplin, gr. to W. NEATH BAKER, Esq., Gloucester, was first; 2nd, Mr. Fewtrell, gr. to C. C. TUGWAY, Esq.

Mr. BANNISTER had the best Pears; and Mr. FARMER, Tewkesbury, was 2nd.

VEGETABLES.

The collections of these were of very high quality, the following being prominent exhibitors, viz., Messrs. W. L. BASTIN, who secured a Gold Medal; J. HALL, WELLS, BANNISTER, A. ROSS, G. SUTTON, J. McCULLOCK, and E. BENFIELD.

Non-competitive Exhibits.—Messrs. GARRAWAY & Co., Durdan Down Nurseries, staged sixty dishes of excellent Apples; Messrs. PARKER & Sons, St. Michael's Hill Nursery, and Mr. CHAS. WINSTONE, florist, Bristol, each had splendid displays of wreaths, bouquets, sprays, &c.; and Messrs. JAS. CARTER & Co., London, exhibited a stand of seeds and vegetables. T. C.

ANCIENT SOCIETY OF YORK FLORISTS.

NOVEMBER 16, 17, 18.—The nineteenth annual autumn show of the Ancient Society of York Florists was held in the large Exhibition Building at York, and was a great success.

PLANTS.

Groups.—The groups, although not so numerous as in former years, were of good quality. For group of Chrysanthemums, interspersed with foliage plants, the best exhibitor was J. T. KINGSTON, Esq., Clifton, York (gr., Mr. R. McIntosh); 2nd, Mrs. GURNEY PEASE, Darlington (gr., Mr. McIntyre).

The best group of Chrysanthemums, not exceeding 100 square feet, was from J. W. HEILDS, Esq., Acomb, whose group was of great merit, and included some excellent blooms of the best varieties.

Specimen Plants.—Four Chrysanthemums, incurved, 1st, Mrs. GUTCH, Holgate (gr., Mr. Everard). This exhibit included a splendid plant of C. H. Curtis.

Four Japanese distinct, 1st, Mrs. GUTCH, Holgate, who showed a fine plant of a variety named Mrs. Gutch, a sport from Val d'Andorre.

Cut Blooms.—For thirty-six blooms, eighteen Japanese and eighteen incurved, 1st, A. WILSON, Esq., Tranby Croft (gr., Mr. Leadbetter), who staged a splendid lot. 2nd, Earl of HARRINGTON, Elvaston Castle (gr., Mr. J. Goodacre).

The best collection of twelve Japanese distinct was from the Earl of FEVERSHAM, Duncombe Park, Helmsley (gr., Mr. Williams).

For a collection of eighteen cut-blooms distinct, Major O. V. LUMLEY, Clifton, York (gr., R. Agar), was 1st.

The best Japanese variety shown in sixes, was Eva Knowles from Lord FEVERSHAM; and the best yellow Japanese was Edith Tabor from the same exhibitor.

FRUIT.

The best six bunches of Grapes were from Lord BARNARD, Raby Castle (gr., Mr. J. Tullett), who had two bunches of Barbarossa, 10 lb. each, also Black Alicante, and Royal Vineyard; Earl of HARRINGTON, 2nd.

Lord HOTHAM had the best two bunches of Black Grapes, and the best White Grapes.

In the class for a collection of dessert fruit, to consist of two varieties of Grapes, two varieties of Apples, and two varieties Pears, Lord BARNARD was 1st; Sir J. W. PEASE, Bart., Hutton Hall (gr., Mr. McIndoe), 2nd.

The best collection of fruit of sixteen dishes of culinary Apples, eight dishes of dessert Apples, and twelve dishes of Pears. Some very excellent quality was evident in the exhibits staged, both Apples and Pears being of first-rate size and colour for northern-grown samples. 1st, Sir J. W. PEASE, Bt.; 2nd, Earl of HARRINGTON.

Sir JOSEPH W. PEASE, Bart., had the best six dishes of dessert Apples; and J. R. PEASE, Esq., Hesslewood House, Hessle (gr., Mr. Picker), was 2nd. Sir J. W. PEASE had also the best twelve varieties of Apples (six fruits of each).

The best six dishes of culinary varieties were from W. HUTCHINSON KIRBY, Esq., Moorside; and the best six dishes of Apples (dessert) from Sir J. W. PEASE.

Six dishes of Pears, distinct were best from Lord HOTHAM.

VEGETABLES.

There is always a remarkable show of vegetables at this show. For a collection of vegetables, home-grown, arranged for effect, space 6 feet by 4 feet: 1st, G. EXELBY, Esq., Holgate, York, a very excellent arrangement; 2nd, R. BELL, Esq., Haxby, York. The above are the principal classes only in the various sections.

Non-competitive Exhibits.—Messrs. JAS. BACKHOUSE & SON, Ltd., decorated the orchestra with fine specimen Conifers and other shrubs. The same firm exhibited upwards of 100 varieties of Apples.

Messrs. SUTTON & SON, Reading, had a fine stand of Cyclamen plants in bloom.

Messrs. CLIBRAN & SON, Altrincham, showed new Chrysanthemums and decorative plants.

ROYAL BOTANICAL, MANCHESTER.

NOVEMBER 17, 18, 19.—An excellent show in connection with the above Society was held in St. James' Hall, Manchester, on the above dates.

In all classes the exhibits were plentiful and of much merit, especially the cut flowers shown in the stands of forty-eight varieties. In this class a valuable Silver Cup was offered by the Earl of DERBY, in addition to a considerable money prize. There were five competitors. A fine group of Chrysanthemums and large Palms from the Society's gardens at Old Trafford were arranged along the middle area of the Hall, and measured 100 yards in circumference. It contained specimen blooms of all the best varieties, and reflected great credit on Mr. P. WEATHERS and his staff of assistants.

Cut Blooms.—Twenty-four incurved, in twelve varieties.—Here the Dowager Lady HINDLE, Hadsor House, Droitwich (gr., Mr. Crook), was 1st, the finest varieties being Egyptian, Madame Ferlat, Wm. Tunnington, C. H. Curtis, Jeanne d'Arc, Mlle. Lucie Faure, Mrs. Coleman. E. BEHRENS, Esq., Bettisfield Park, Whitchurch, Salop (gr., Mr. H. West), was 2nd.

The best twelve incurved blooms were those shown by Messrs. FOSTER, The Nurseries, Lavant, the best blooms being Dorothy Foster, M. G. Ferlat, C. H. Curtis, Golden Empress, Ma Perfection, Duchess of Fife, Countess of Warwick. Dowager Lady HINDLE was 2nd.

The best thirty-six Japanese blooms in eighteen varieties were shown by F. VALLIS, Fruit Farm, Bromham, Chippenham, who was 1st with popular varieties; and the 2nd prize fell to E. BEHRENS, Esq., Bettisfield Park.

The best forty-eight blooms, twenty-four Japanese and twenty-four incurved, distinct, constituted a strong class, for there were seven entries, and Mr. W. H. LEES, gr., Trent Park, New Barnet, was 1st, with a magnificent exhibit, well shown. Mr. GOODACRE, of Elvaston Castle, Derby, was 2nd, with almost equally fine blooms.

Eighteen Japanese blooms, in nine varieties, were well shown by Mr. W. H. LEES, who was 1st; and by R. A. BOWRING, Esq., The Heath, Cardiff (gr., Mr. Joy), who was 2nd.

The finest twelve Japanese varieties, distinct, were those shown by C. WATERHOUSE, Esq., Prastbury; and Mr. F. VALLIS, Fruit Farm, Bromham, Chippenham.

For thirty-six miscellaneous varieties, Mr. T. BROCKLEBANK, gr., The Hollies, Woolton, was 1st; and J. LAMBRA, Esq., Kenwood, Bowdon, was 2nd.

Groups and Specimen Plants.—These consisted of Chrysanthemums, set off by foliage plants, in a space of 80 square feet, T. HARDCASTLE SYKES, Esq., Cringle, Cheadle (gr., Mr. Roderick), taking the leading prize with a tastefully arranged lot of plants, including several very brightly-coloured Codiums; the 2nd prize fell to JAS. WALTON, Esq., Woodlands, Newton Heath (gr., Mr. Horrock).

G. H. GADDUM, Esq., Aditt House, Didsbury (gr., Mr. Bradburn), was the winner in the class for nine large-flowered Chrysanthemums in pots. He staged grand specimens of C. H. Curtis, Duchess of Fife, and Charles Davis; THOS. HARKER, Esq., Brook House, Withington, took the 2nd prize.

The best six Japanese plants, grown in pots, were shown by G. H. GADDUM, Esq.; and THOS. HARKER, Esq., of Withington, 2nd.

Besides Chrysanthemums there were exhibits of cut-flowers of a miscellaneous character, and of Orchid-blossoms. Plants of Primulas, Cyclamens, and table-plants. The trade, in the persons of Messrs. J. CYPHER & SON, CANNELL & SONS, JOHN ROBSON, of Bowdon, Messrs. DICKSON & ROBINSON, and DICKSON & BROWN, contributed quantities of plants, cut-blossoms, &c., doing much towards adding to the effect as a whole.

SCOTTISH HORTICULTURAL.

EDINBURGH: NOVEMBER 17, 18, 19.—The exhibition, briefly alluded to in our telegram of last issue, was one of the finest yet held by this Society in the autumn. The locality was the Waverley Market. As many as 4000 cut blooms were staged, which is much in excess of former years; and the plants, too, showed improvement, owing, perhaps, to the increase of the money-prizes in the classes for plants. Nowhere else in this country can there be witnessed such a grand display of Japanese Chrysanthemums, arranged with their own foliage in vases, as here. This is a departure from the orthodox method, which might be followed by other societies with a gain in the attractiveness of their shows.

CUT BLOOMS.

The principal class was one for twenty varieties in triplets, Chrysanthemum foliage only being employed. A piece of plate, value £20, with £15 in cash, was offered as the premier award, and the competitors numbered six. Mr. T. LUNT, gr. to A. STIRLING, Esq., Kier, Dunblane, was deservedly placed 1st, his blooms being grandly developed and suitably staged. We mention a few of the finer ones, viz., Oceana, Lady Ridgway, M. Chenon de Leché, Mrs. Weeks, Australian Gold, Mlle. M. A. de Gilbert, J. Bidencope, Mrs. J. Lewis, Eva Knowles, and Simplicity. Mr. D. NICOLL, gr. to J. W. BELL, Esq., Rossie, Forgandenny, was a creditable 2nd; Mr. A. Haggart, gr. to the Hon. LUCIUS O'BRIEN, Moor Park, Ludlow, was 3rd.

For twelve distinct varieties in triplets shown singly in vases, the competition was keen, and Mr. P. ADDISON, Blackhouse, Skelmorlie, took the premier award with excellent examples, M. Chenon de Leché, Pride of Exmouth, Lady Hanham, M. Gruyer, Phœbus, Charles Davis, and M. Pankoucke, were among the finest; Mr. D. NICOLL was a most creditable 2nd, with slightly smaller blooms, of almost identical varieties.

The best four vases, each to contain six blooms, there was keen rivalry, and Mr. D. MACKAY, Kingston Grange, was 1st with a creditable exhibit; and Mr. P. WHANNELL, The Drum, Gilmerton, 2nd.

In the class for the twelve Japanese blooms, arranged in one vase, Mr. ADDISON took leading honours, although his blooms were much crowded together owing to their size. For six blooms, any one variety, Mr. J. BIRD won with grand examples of Viviani Morel. Specified varieties, in stands of six blooms each, were numerous. Mr. ADDISON was 1st for Duchess of York, C. Davis, President Borel, and E. Molyneux, in all cases showing good representative specimens of each. The variety Edith Tabor was staged in grand condition by Mr. J. DAY, gr., Galloway House, Garliestown; as was also Mutual Friend by Mr. ARMSTRONG, of Musselburgh.

What are known as decorative varieties, that are not disbudded, had a special class provided for them, an exhibit to consist of three vases and three varieties; and as seventeen competitors entered the lists an attractive exhibit resulted. Mr. A. C. CAMERON, Benrock, Dundee, was 1st with well chosen varieties tastefully arranged with suitable autumn foliage; and Mr. G. CHAPLIN was 2nd. Single-flowered varieties receive encouragement; and for one vase of flowers of Mary Anderson Mr. A. CAMERON was 1st; and Mr. J. HOLMES, Winton Castle, was 2nd.

Provision was made for blooms staged in the orthodox manner on boards. It should, however, be admitted that, good as they were in point of quality, they lacked the fine effect produced by the blooms set up in vases.

For thirty-six distinct, one bloom of each, Mr. T. LUNT was here successful with popular varieties, and Mr. ADDISON was 2nd. Mr. T. LUNT was also 1st for twelve blooms, amongst thirteen competitors. Mr. J. H. COMINO, Grantully Castle, secured a similar place for six varieties.

Incurved varieties were indifferently staged. Mr. MARTIN was 1st for twelve, with fairly good examples, and likewise for six of C. H. Curtis. Mr. A. CAMERON was 1st for six varieties.

PLANTS.

These were certainly better shown than on any previous occasion, owing, as in the case of cut blooms, to the increase of the prize-money, viz., £10 as the highest prize for six specimens. Mr. J. THOMSON, Preston Grange, Prestonpans, was here 1st with a fine collection of plants, several of them being 5 feet in diameter, each with about 150 fair-sized blooms. Mr. D. CAVANAGH, St. Edwards, Murrayfield, was 2nd.

For four Japanese varieties, Mr. THOMSON was 1st, with evenly-flowered specimens. Poupous were freely flowered and not too formally trained, the best coming from Mr. J. MACPHERSON, Dunisla House, Edinburgh.

MISCELLANEOUS.

Epergnes, vases, and bouquets were well shown; many of the leading awards falling to the Misses TODD, Stoneybank, Musselburgh, who exhibited much good taste in their devices. Mr. A. E. TODD secured the leading award in the class for the best arranged circular table with cut flowers and small plants—a very commendable exhibit.

Fruit and vegetables were numerous, and of the usual fine quality seen at Edinburgh. Exhibits not for competition added to the interest of the show. Mr. JOHN DOWNIE, nurseryman, Edinburgh, contributed a beautiful collection of floral devices; Mr. T. FORTUNE, Edinburgh, made a somewhat similar contribution; and Messrs. DOBBIE, Rothesay, a collection of decorative Chrysanthemums, Apples, and Potatoes. The most commendable exhibit, however, was that from Mr. H. J. JONES, Ryecroft Nursery, Lewisham, who staged three dozen beautifully-flowered plants of Begonia Gloire de Lorraine, and twenty dozen Chrysanthemum blooms, several of which were Certificated.

BATLEY AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 19.—The thirteenth annual show of this Society was held in the Drill Hall on the above date. Competition was keen in all the classes, and especially so in the class for thirty-six cut blooms, for which there is offered a valuable Silver Cup, value £21.

The stands had to consist of eighteen Japanese and eighteen incurved, and the 1st prize fell to G. B. COCKBURN, Esq., Cloughton, Birkenhead (gr., Mr. G. Burdon); the 2nd to A. WILSON, Esq., Tranby Croft (gr., Mr. Leadbetter); and the 3rd to Mr. Cole, gr. to Earl SPENCER, Althorp, Northampton.

In the twelve Japanese, distinct, class, the Earl of HARRINGTON, Elvaston Castle (gr., Mr. Goodacre), was 1st; and G. B. COCKBURN, Esq., (gr., Mr. Burdon), 2nd.

For twelve incurved, G. R. COCKBURN, Esq., Cloughton (gr., Mr. Burdon), was 1st; and Mr. GOODACRE 2nd.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 21.—A meeting of the Floral Committee was held at the Royal Aquarium on the above date. There were fewer exhibits than on the previous occasion, but several very distinct and valuable novelties were submitted for Certificates. This honour was granted to the following varieties:—

MRS. BARKELEY (Japanese), a very large, smooth, somewhat reflexed flower, of a shade in pink or rose, being similar in colour when at its best to highly-coloured blooms of Viviani Morel. In some of the blooms many of the petals are silver-tinted. The petals are broad, flat, and do not taper, most of them ending bluntly, with a slight, wedge-shaped notch in centre. A most distinct and grand novelty, from Mr. H. Weeks, Thrumpton Hall Gardens, near Derby.

EDITH DASHWOOD (Japanese), a delicately-tinted flower, suggestive to some of Eda Prass. The petals are rather narrow, and taper almost to a point. From Mr. Weeks.

VICTORIA (single), a good sized flower, of canary-yellow colour, pretty in form, but with a very prominent disc. From Mr. G. W. Forbes, Regent House, Surbiton.

FLORIE (single), a finely formed flower, of rosy-pink, with a white band encircling the disc, a very charming variety shown by Mr. Forbes, who exhibited other very pretty varieties.

CHATSWORTH (Japanese).—This variety has already been seen in many important stands this season. Messrs. Cannell & Sons, Swanley, exhibited three very fine blooms on this occasion, in which the colour-stripes upon the florets were very finely developed, the tips incurving. This variety is among the prettiest of the smooth-typed Japanese. (H. Cannell & Sons.)

Mr. H. J. Jones exhibited blooms of a white Japanese Anemone, Mrs. C. R. DUNN; and Mr. Witty, Superintendent of Nunhead Cemetery, showed several decorative Japanese varieties, including GOLDEN SHOWER, and WHAT HO! blooms of which were shown on the last occasion. The plants now forthcoming were not sufficiently dwarf and strong in habit to satisfy the committee of the usefulness of the varieties for decorative purposes.

Mr. N. Molyneux, Rooksbury Park Gardens, Fareham, showed blooms of three incurved varieties—GOLDEN GEM, a yellow one; Earl of CRAWFORD, purple; and NELLIE S. THREEFALL, white.

Mr. Weeks had about three dozen fine blooms of English-raised novelties, of which the best were the following:—Miss MAUD DOUGLAS, an incurving Japanese, pale purple, silver reverse; ANNIE PREVOST, a reddish-purple Japanese, a little rough as shown; J. A. BAXTER, a moderately sized pink Japanese; LITTLE NELL, a white Japanese, with lemon centre.

Mr. W. Wells showed a single-flowered variety, a white sport from DAISY BRETT. The sport has wider, flatter petals, and is pure white; also a red coloured single variety, named Mrs. BAILLIE; and HERBERT HENDERSON, a shaded single-flower, white and pale purple.

SHIRLEY & DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.

NOVEMBER 21.—The monthly meeting of the above Society was held at the Parish-room, Shirley, Southampton, on Monday last, when there was more than an average attendance of the members, the President, W. F. G. SPRANGER, Esq., presiding. The lecture was under the auspices of the Technical Education Act Committee, Southampton County Council, and was given by Mr. E. T. MELLOR, B.Sc., London, Lecturer in Biology at the Hartley College, Southampton, and was the first of two, the subject being "The Soil."

The lecturer dealt with his subject in three parts—(1) The Origin and Formation of Soils; (2) Composition of Soils; (3) Nutritive and other Constituents of Soils.

Each part was profusely illustrated by means of lantern-slides, chemical experiments, and diagrams, and was thus made most interesting as well as instructive.

Next month the lecturer will deal with the chemical aspect of the subject in his second lecture.

At the close of the lecture, a number of interesting ques-

tions were put to the lecturer, who replied to each one in a satisfactory manner.

There was a very good exhibition of Chrysanthemums, both plants and blooms, contributed by the members, but a number of First-class Certificates were awarded the exhibitors.

Cordial votes of thanks to Mr. Mellor, to the President, and to the exhibitors, terminated a very pleasant meeting.
H. J. Hobby, Secretary.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending November 19, is furnished from the Meteorological Office:—

"The weather during this period was generally fair over the greater part of the kingdom, but slight rain fell occasionally in the western and north-western districts, and much damp mist, or fog was experienced over England.

"The temperature continued above the mean, the excess ranging from 2° in 'Ireland, S.' and 3° in 'England, S.W.' and the 'Channel Islands,' to 5° in 'Scotland, E.' and several parts of 'England, and to 6° in 'England, N.E. and E.' The highest of the maxima were recorded on rather irregular dates, and ranged from 82° in the 'Channel Islands,' 61° in 'Ireland, S.' and 60° in 'Scotland, N.' and 'England, N.E. and S.,' to 57° in 'Scotland, W.' The lowest of the minima were registered during the earlier days of the week, when they ranged from 27° in 'Scotland, E.,' 'England, N.E.,' and 28° in 'Ireland, S.' to 34° in 'England, E., S., and N.W., and to 39° in the 'Channel Islands.'

"The rainfall was less than the mean in all districts over central, southern, and eastern England, and in the east of Scotland the fall was extremely slight.

"The bright sunshine was less than the normal in most parts of the kingdom, but rather exceeded it in 'England, S.' and the 'Channel Islands,' and equalled it in the north and east of Scotland. The percentage of the possible duration ranged from 27 in 'England, S.,' 24 in the 'Channel Islands,' and 23 in 'England S.W. and E.,' to 12 in the 'Midland Counties' and 'Scotland, W.,' and to 6 in 'England, N.E.'"

GARDENING APPOINTMENTS.

MR. JOHN FLOAT as Head Gardener to J. T. CLIFTON, Esq., Lytham Hall, Lytham, Lancashire.

Mr. R. H. BUTCHER, formerly Gardener at the "Acacias," Reading, as Head Gardener to Mrs. MYERS, Sandford Priory, Newbury, Berkshire.

Mr. GEORGE JONES, for the past two years Foreman in The Gardens, Glanusk, Crickhowell, as Head Gardener to JOHN BEYNON, Esq., Trewern, Whitland, South Wales.

Mr. W. F. BLUNT, late Head Gardener, Mill Hill, Middlesex, as Head Gardener to H. E. PHILLIPS, Esq., Caversfield House, Bleicester.

Mr. DAVID RHIND, who has been seven-and-a-half years gardener to The MACKINTOSH of Mackintosh, Moy Hall, as gardener to the Marquis of LOTHIAN, Monteviot, Jedburgh.

Mr. WM. SCOTT, for the last three years Foreman at Ballikilrain Castle, Balfour, N.B., as gardener to WM. M. ROSE, Esq., Wolston Grange, near Rugby.

CATALOGUES RECEIVED.

THE DEVON CHRYSANTHEMUM, Teignmouth, South Devon—Choice Chrysanthemums.

W. P. LAIRD & SINCLAIR, 73, Nethergate, Dundee; and at Cupar, Fife—Roses, Hardy Herbaceous and Alpine Plants.

JOHN RUSSELL, Richmond, Surrey—Hardy Trees, Shrubs, Roses, Fruit-trees, and Herbaceous Perennials.

WOOD & INGRAM, Huntingdon—Fruit and Forest Trees, Conifers and Ornamental Trees and Shrubs, Hardy Climbers, Roses, &c.

KELWAY & SON, Langport, Somerset—Gladioli.

OSKAR HENRMANN, 7, Gross Baekerstrasse, Hamburg—Card-board-boxes for Packing Seeds, Flowers, Wreaths, Palm-leaves, Bouquets, &c.; and numerous articles required by Florists.

BOOKS OF ILLUSTRATIONS OF SEEDS, FRUITS, GRASSES, &c.: J. G. We know of no one work which contains all that you require. *The Dictionary of Gardening*, published by Upcott Gill, 170, Strand, W.C.; and *Sutton's Grasses*, published by Messrs. Sutton & Sons, Seed Merchants, Reading, would afford you a considerable number of illustrations, as would also their *Amateurs' Guide*. Figures of various seeds are found in Kerner and Oliver's *Natural History of Plants*, and other botanical text books.

BULBS, TUBERS, &c., FOR AN AUSTRALIAN GARDEN: W. M. Amaryllis Belladonna, and other species and hybrids; Sprekelia formosissima, Valotta purpurea, Crocosmia, Ixia, Tritonias, Crinum, of temperate and subtropical regions; Watsonias, Gladiolus Hyacinths, Crocus, Tulips, Agapanthus umbellatus; Iris, in great variety, but not I. Kaempferi; Alstroemeria of species, Guernsey Lilies, and many more.

CORRECTION (p. 371)—Beech coccus: for fronds read bark. Balfat show: for Viscountess Hambledon read Hon. F. W. Smith, M.P.

"CUBAKIKO" BEAN: C. G. Probably, the Florida velvet Bean is meant. It may not be a "Bean" at all, but a climbing plant, "Liane" of the Brazilians, as it grows, as is stated in the advertisement quoted, as much as forty feet annually.

"GRENATE" IN SWITZERLAND: S. C. We incline to the opinion that Cuphea platycentra is meant.

INSECTS: W. Murray. The caterpillars are those of the great yellow-under-wing moth. They were no doubt introduced into the frames in the turf. You cannot do better than search for them at night; look under loose lumps of earth or turf by day; sprinkle soot round the plants. C. O. W.—Phthorothus. Vari us species of millipedes (Julus), (not wireworm) which live on decayed vegetation. You might lessen their numbers by digging the land and turning in some fowls, also by the use of quicklime and trenching. The insects ruining the various crops, as Spinach, may be the Spinach-grub, or the larvæ of some description of weevil.

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.

—J. C. 1, Beurré Superfin; 2, Bergamotte d'Esperen; Apples: 1, Nonsuch; 2, Tower of Glamis; 3, local sort of no value—not Easter Pippin.—Programme. 1, Dumelow's Seedling; 3, French Crab; 4, Gipsy King; 5, Braddick's

Nonpareil; 2, not recognised, a very pretty Apple—will examine it again. The Pear is Easter Beurré.—Gloucester Terrace. 1, Easter Beurré; 2, White Doyenné; 3, Beurré Diel; 4, Edmund Jupp; 5, Giont Morceau; 6, evidently from the stock, and worthless.—Manning. Apple, Wareham Russet.—Geo. Wall. Your Apple has since been determined to be American Mother.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—J. Wakeman. Eucomis punctata.—J. H. B. Sedum spectabile.—T. L. & Co. Datura Stramonium.—W. B. Salvia tubifera, Bot. Reg., 1841, t. 44.—C. W. S. Mühlenbeckia or Polygonum complexum.

POTATO ANALYSIS: B. G. S. Albuminoids (or flesh-former), 2.24; soluble carbo-hydrates (some digestible, others not), 21.36; woody fibre, 1.00; fat, 0.21; ash (mineral ingredients derived from the soil), 1.21; water, 73.97. Another form of analysis is the following:—Per cent. of ash, 3.74; potash, 59.8; soda, 1.6; magnesia, 4.5; lime, 2.3; phosphoric acid, 19.1; silica, 2.3; chlorine, 2.8.

SINGLE-FLOWERED ROSES: S. C. If these are worked on Manetti or seedling Briars you will be much plagued by suckers, but in any case you might bad them low down or otherwise.

TOMATO: A. M. Squeeze the pulp in a vessel containing warm water, and the good seed will sink to the bottom. Then gently fill up the vessel, and allow the particles of pulp and light seeds to flow away over the rim. The cleaned seed may be dried on a fine-meshed sieve.

TOMATOS FOR MARKET: T. A. Best of All, Maincrop, both of Suttons, Reading; Hackwood Park, Chemin Rouge, President Garfield, and Hara Green Favourite. Any or all of these.

TWIN-FLOWERED CYPRIPEDIUM INSIGNE: A. W. B. A freak by no means uncommon in this species, due, probably, to great vigour, induced by a large amount of plant-food in the compost.

VALUE OF STOCK IN THREE GLASS-HOUSES. Capital. You should consult a professional horticultural valuer, who would come and inspect the stock of plants and form his estimate on the spot.

VANILLA: A. M. The plant does not "set" its flowers unless the flowers are manipulated in the manner described by us, however vigorous the growth may be. The flower remains unfertilised in our glasshouses for the reason that the insects which visit the flowers and carries the pollen to the stigmatic surface, do not exist here. V. planifolia, the Mexican representative of the genus, furnishes the best vanilla, and aromatica is a synonym; although a southern tropical American species, named V. aromatica, is retained as a true species in the Index Kewensis.

WATTLE, RUSH, OR HURDLES, AS PROTECTION TO PLANTS AGAINST FROST: J. T. P. There is a manufacture of straw mats carried on at Aylesbury by a lady. These mats last two or three years with care, and are very good security against frost. As being capable of withstanding rough winds in exposed sites, thatched-wattle hurdles are to be recommended. You might be able to obtain either of the horticultural sundriesmen.

WEeping Willow Worked on Poplar: S. C. The union of Poplar and Willow might answer. Perhaps some of our readers who have had experience of the Poplar as a stock will kindly give them.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

(For Markets, see p. viii.)

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 3, 1898.

POGGIO GHERARDO.

I HAD been lamenting that I could find no gardens in Florence after my mind at all, and that churches, statues, pictures, though supremely beautiful in themselves, altogether held the field, when I chanced to hear from a young man who resides in the neighbourhood, that one of the sights of Italy (that was the expression he used), was not far off, and if I could only see it I should be delighted with it in no common degree. That was simply sufficient to make me decide on the course to be pursued, and it was not long before my wife and I found ourselves in the Poggio Gherardo, and asking for admittance at the door of Mr. and Mrs. Ross. Admission was at once granted to us in the kindest possible manner, and a feast of good things was soon spread out before our eyes. I should, perhaps, say here that Mr. Ross is in the strictest sense of those words an Orchid-grower. I have very often heard it said that if you grow Orchids at all you will soon come to think of nothing besides—they transport you; they fill you; they delight you so much that there is no room left in your mind for anything else in the way of flowers—and certainly it is often the case, and I have seen it over and over again. Mr. Ross's houses and collection of Orchids are splendid, and no connoisseur can tear himself away from them till a very long visit has been paid. As a matter of fact, Mr. Chamberlain spent the best part of a day here not long ago, inspecting the collection of plants from morning till evening. Unfortunately, the Orchids were rather lost upon me, because they are somewhat over my head. I have never had an opportunity of taking to them at all, as I wish had been the case. But as it was, under Mr. Ross's superintendence I had a delightful time in the place.

The full Orchid-season, of course, was not as yet come on, but the following grand plants were in blossom among many others that might be named. *Calanthes* of many varieties, among them the beautiful *Darblayana*; *Laelia anceps* and *autumnalis*; *Paphinia cristata* *Modigliani* (the pure white variety); some very fine varieties of *Oncidium papilio*, *Cirrhopetalum ornatisimum*; *Dendrobium Phalaopsis*, *Schroederi* and *superbiens*, and many *Cypripediums*. There were several hundred young hybrid *Cypripediums* coming on, and two of Mr. Ross's hybrids in blossom, one *Rossianum* being extraordinarily robust and floriferous, with four flowers, one stem being twin-flowered. Mrs. Ross told me that frequently occurs. If one had seen nothing more than these it would indisputably have been a red letter day to me.

Though I do not think I should ever wish to

grow Orchids to the exclusion of everything else, it may very readily be conceded that there is a fascination about them which cannot easily be surpassed. As one so often finds about plants, the principle of compensation asserts itself on the Poggio Gherardo. Manifestly, as a rule, tropical Orchids have found a second home which they like, and there is no longing on their part for South American forests, or Burmese jungles, or anything else. Italy is paradise to them, and there is an unequivocal response on their part; but I was told that cool Orchids do not thrive in the same way, and that some of the beautiful North American Orchids, e.g., *Cypripedium spectabile*, resent any attention they may receive. This really seems to be only fair, when for so many other things Nature does everything, and success is so easily gained.

I may perhaps be allowed to say here that Mrs. Ross is an artist of the first rank, and that she has made representations of all her husband's Orchids, which leave nothing to be desired. I think she has something like 1,800 of these pictures, and we had the greatest pleasure in looking over a large number of them. But though Orchids are Orchids, and my only lament about them is that I am not more conversant with them, I feel that I must leave the houses now, or this letter will run into far too great a length.

I have said that Mr. Ross is absorbed in the cultivation of Orchids, but Mrs. Ross has another department of her own, and she is very intent upon it. It is not for me to describe the mysteries of Vine-growing, and how Olives are graded in three several ways, &c. All this and many other things besides, require an education of their own, and must be excessively interesting to those who are located in this sunny clime.

My eyes very soon fell upon objects of interest with which I have to do in the Isle of Wight, and some two or three of them I shall venture to name.

It is curious how one pounces on a thing with which you are familiar, and it seems as though you never could have enough of it. I was arrested at once by a large bed of *Oncocyclus Irises* which were growing *ad libitum* on one of the terraces, and which looked as though they were conscious they had nothing in the way of winter to fear. If those in my garden were ever to have the same appearance on the seventh day of November, I should consider them doomed to most certain destruction before long. How such glorious foliage would be mauled by the bitter east wind—how the thick rhizomes of some of them would be overwhelmed by the floods of rain—but here they were full of promise, which is not at all likely to be dashed, and a glorious feast of blossom may be counted on for a certainty in February or early March! What would I not give for such a walk over the course! No need for any precaution about this, or safeguard against that too probable danger! *Iris Susiana* and all the rest of them will never fail you in Italy at all if you only give them a chance, and though, of course, I am here much too soon to see my favourite flower in all its beauty, I can well understand, from the look of the plants, that in point of size, as indeed about everything else, the blossoms must be of super-excellent value.

Nerines are just now beyond their prime, but there were a few in blossom in pots, and it must have been splendid a short time ago to see a bed of *Nerine Fothergilli* at its best.

Could anything of a more vivid colour be conceived? Among the many good things which I noticed in this garden, it may be said that I have never before seen *Dahlia imperialis* flourishing in the open ground; but I suppose this is an illustration of the difference between England and Italy. Here it is splendid, a very great ornament to the place. But my walk round the terraces and in and out of the different nooks in the garden must be left, in some measure, undescribed, or I shall call for too much space.

I think I may be doing a real service to some fruit-growers in England, and specially to those who live in the south of it, or in the Isle of Wight, if I recommend them to attend to the few following facts. I will relate as nearly as I can what I came across here. We found ourselves in our peregrinations before a tree which I should guess to be about 11 or 12 feet high, and I was informed that it had come from Japan, and rejoiced in the name of *Kaki Giboushin*. This tree must have had at least 200 golden globes hanging from its branches, each one being nearly of the size of a Jaffa Orange, and of a glorious colour. When it was at its best it must have been a sight to see, and the tree must be well worthy of cultivation for the spectacle, but it is not as a spectacle that I am referring to it now. Mrs. Ross asked me if I had ever tasted the fruit, to which I confidently replied that I had done so. And how did you like it? was the next question she put to me. I said, that is a different thing, and I do not remember that I was much captivated by it. She then enquired in what way I had eaten it? I told her, and it seemed to amuse her very much, for she at once replied, "it is no wonder that you did not care more for it; the idea of adding sugar is absurd, and no one ever takes it fresh from the tree, it sets your teeth on edge if you do." I remember somewhere about twenty years ago, that the late Sir William Hutt brought *Diospyros Kaki* to Ryde, and Lady Hutt, knowing that I am interested in such things, sent me a slice of their very earliest fruit, and with it the exact amount of pounded sugar, daintily wrapped up in a piece of paper, which she deemed to be necessary. Her kindness was indisputable, but her knowledge about the matter—and no wonder it was so at that time—was limited. Mrs. Ross laughs at the idea of sugar at all, and she says that when the fruit of *Diospyros Kaki* is eaten, it should be eaten as *Medlars* are. At first, it should be kept in some warm room, and it should not be eaten till it is transparent and soft. If you do this with it, she declares that it is well worthy of being called the food of the gods, and she thinks that in all her wide experience she has never come across anything that can be put in comparison with it; its flavour is unlike anything else, it is unique, "it is heavenly." After such an attestation as this, it seemed well worth while to attend to any instruction regarding it, and the following points may be noted. The best sort for an English garden is *Kaki Giboushin*, because it comes on early in the year, and therefore ripens better than some of the others; it is also of great size and of beautiful colour. This *Kaki* is most avaricious of nutriment, it can hardly be too highly manured, and two good-sized basketfuls of sheep's-dung are given to each tree in the course of a year. It is satisfactory to learn that this Japanese tree will stand at least 14 or 15 degrees of frost; and Canon Ellacombe, I know, must have had it in his garden for well nigh twenty years.

This imperfect notice of a very interesting

spot must now come to an end. It is a delightful drive from Florence to the Poggio Gherardo, and when you get there, the kind greeting you receive at a stranger's hands makes you glad that the expedition was made.

The place is fragrant with memories of other than a horticultural sort. Boccaccio loved it, and described it in his *Decameron*, under its old name of Palagio del Poggio, as the first place visited by the company, who fled from the plague in Florence, and his name will linger here through days that are to come. Poggio Gherardo was bought by Gherardo Gherardi in 1432, and Mr. Ross bought it in 1889 from the last of the Gherardi family. It is said that Sir John Hawkwood besieged it, and destroyed that part of the old castle which is not machicolated, and which is of far later date than the rest. The view of Florence, with its Duomo and Campanile, and all the surrounding tract of country, dotted over, as it is, by innumerable villas, and bounded on the horizon by mountains, which rise one above another, is a thing which can never be forgotten.

It is a matter for thankfulness that Mr. Ross's castle and his Orchid-houses were not ruined by the earthquake which was recently felt here with such tremendous force. As it was, I believe his loss in plants was considerable, and his habitation has needed seventeen large iron clamps to hold it together since the shock. I have several times been told that the leaders of science say that all Florence would have been laid in ruins if the earthquake had lasted only two seconds longer, and that is the exact space of time which Mr. Ross mentioned yesterday to me as standing between destruction and possession of all their fair possessions in Italy.

May the Orchid-houses go on and prosper for many a long year to come, and *Oncocylus* Irises flourish to their very uttermost, and *Nerines* come and go, and *Kaki* Giboushin yield its luscious fruit. May a very much longer time indeed than two seconds stand between the destruction of one of the fairest regions of the earth and objects of great interest, of which now it is full. *H. Ewbank.*

ORCHID NOTES AND GLEANINGS.

"DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDÉES."

THE following species and varieties are figured in No. 21 of this useful publication:—*Aërides multiflorum*, Roxb.; *Cattleya Mossiae* var. *Germinyana*, Hort.; *C. Cecilia* var. *elata*, Cogn.; *Cypripedium purpuratum*, Ldl.; *C. Charles Richman*, Hort.; *Lælia purpurata* var. *Schoderi*, Rehb. f.; *L. purpurato-grandis*, G. Mantin; *Lælio-Cattleya elegans* var. *de M. Fournier*; *Miltonia vexillaria* var. *Madouxiana*, Cogn.; *M. Blunti* var. *Lubbersiana*, Rehb. f.; *Odontoglossum crispum* var. *Marise*, Hort.; *O. brevifolium*, Ldl.; *Sobralia macrantha*, Ldl.

In No. 22 the following are illustrated:—*Cattleya Mossiae* var. *de M. Lesueur*; *C. Schilleriana*, Rehb. f.; *Cyperorchis Mastersii*, Benth.; *Cypripedium politum*, Rehb. f.; *Lælia Crawshayana*, Rehb. f.; *Miltonia Bleuana* var. *nobilior*, Hort.; *Odontoglossum crispum* var. *Francisci*, Cogn.; *O. triumphans* var. *Ajax*, Hort.; *O. elegans*, Rehb. f.; *Oncidium macranthum*; *Phajus Owenianus*, Hort.; *Phalenopsis Esmeralda*, Rehb. f.; *Sobralia Veitchii*, Hort.

CATTELEYA LABIATA.

For the past six weeks we have had a good display of blooms of this *Cattleya*. The plants were purchased about five years ago as small pieces with one and two leads each, and now there are 150 blooms on these plants, several spikes consisting of four to six

blooms, which in some instances measure 8 inches across. The colour of the lip varies considerably in some flowers, the crimson markings being more striking than in others. The plants show up well when associated with *Dendrobium Phalaenopsis Schroderianum*. *Cattleya labiata* at Bickton grows in a span-roof intermediate-house 40 by 20 by 12 feet, but its length running north and south it is exposed to east and west winds, and in severe winter weather the temperature inside falls for a time below 40°. The plants at such times are kept dry at the root, short however of shrivelling the pseudo-bulbs. Lumpy peat and sphagnum-moss are the chief constituents of the potting compost; and the stage on which they stand is of corrugated iron, which is raised to within 2 feet of the roof, and covered with ashes from anthracite coal. I favour Orchid-pots for holding *Cattleyas* in a house so high and wide as ours, as they can then be stood where moisture can be freely afforded during the growing season. Other plants of various genera being grown in the same house beside Orchids, it is not an easy matter to use the syringe and watering-pot in the same careful manner as in a house devoted exclusively to Orchids. The largest number of blooms I have had on a plant is sixteen, several having ten, eleven, and twelve respectively. *W. J. Grace, gr., Bickton, Fordingbridge.*

CATTELEYA × HARDYANA VARIETY.

Messrs Fisher, Son, & Sibray, Royal Nurseries, Handsworth, Sheffield, send a fine form of *Cattleya × Hardyana*, and state that it differs from other varieties of *C. Hardyana* in their possession. It closely resembles *C. × Hardyana laversinensis*, having the same beautiful, rose-tinted petals, with yellowish-white veining, and the same velvety, purplish-crimson lip, with orange-coloured patches on the side lobes, and veins running into the margin as in that variety. The sepals are also creamy-white freckled with rose as in the variety *laversinensis*, but in this, as at present developed, the rose-freckling is less pronounced than in the original. It is a very showy flower, and, like all the other varieties, delightfully fragrant.

CATTELEYA WARSCEWICZII VAR.

A singular and pretty form of this fine species, sent by Mr. Fred. J. Thorne, gr. to Major Joicey, Sunningdale Park, Sunningdale, which, were it not for the known variability of the flowers on imported plants, might be taken for a natural hybrid. The flower, which has somewhat the appearance of a light-coloured *C. Trianaei*, but with the lip of a true *C. Warscewiczii*, has sepals and petals of a delicate lavender-rose, with midribs of a silvery-white at the base. The throat and the blotch on the centre of the front lobe are of a light purplish-rose; the base of the lip deep rose, with cream-white lines running into the yellowish patches on each side of the middle area. The margin is broad, and of the same hue as the petals. It much resembles a variety recently shown as a hybrid between *C. Mossiae* and *C. Warscewiczii*. *J. O'B.*

THE BULB GARDEN.

CRINUM PURPURASCENS.

THIS graceful though small-growing species of *Crinum* has recently flowered with me. It produces a dense tuft of channelled, recurved, tapering leaves 1½ foot in length, 1 inch in width, dark green in colour, with undulating margins. The flower-scape is purplish-coloured, grows 1 foot high, and bears an umbel of six sessile, erect flowers, with white, linear, drooping segments 3 inches long, on long, slender, purplish tubes. The slender filaments and style are coloured crimson. The plant shows ten bracteoles at the top of the scape, indicating that it has not reached the highest possible number of flowers. The flowers are fragrant when they first open, but only last in good condition for a few days. It grows well in a pot standing in a pan of water in the stove-house, affording shade from strong sunshine. It is very prolific in offsets; as many as twenty have been

produced by a single plant in the course of a year's growth.

VELTHEIMIA GLAUCA.

A plant is somewhat uncommon in gardens, although this is of decorative value, and worthy of commendation. The leaves are 1 foot in length, tapering, sheathing at the base, of a beautiful glaucous-green colour, with undulating margins; from the centre of the leaves a flower-spike rises, bearing about fifty slender, tubular, pendulous flowers, spirally arranged, the colour being rose-pink, spotted and marbled with light red, as also is the spike itself. The spreading mouth of the tube is coloured light purple. The flowers vary in length on different plants, from ¾ inch to 1½ inch. It requires intermediate-house temperature during the winter months, at which period it makes its growth, the bulbs being ripened out-of-doors during the following spring and summer, water being afforded occasionally to prevent the bulbs shrivelling. It requires more careful treatment than does *V. capensis*, a plant well known in gardens. It flowers in October, and lasts in good condition about three weeks. *G. B. Mallet.*

BIGNONIA PURPUREA.

THE subject of the accompanying illustration is one of the most effective and beautiful of stove-climbers. It forms a large specimen in the Palm-house of the Botanic Garden at Cambridge, and growing as it does on a rafter, numerous pendent branches formed quite a curtain of flowers. The colour is bright rosy purple, with paler throat, but not so conspicuously white as might be inferred from the drawing. There is a figure, t. 5800, in the *Botanical Magazine*.

The specimen above referred to is planted out, and grows vigorously, which perhaps may account for some differences of measurement in the published descriptions. The stems are round; the leaves sometimes trifoliate, though mostly bifoliate, with petioles about 1 inch long, the secondary measuring about half as much; the leaflets are broadly ovate and shortly acuminate, from 3 to 3½ inches long, rarely with the teeth shown in the illustration (fig. 114). The cluster of flowers is well represented, and, as may be observed there are flower-stalks above and below, the flowers belonging to which could not be shown. Culture is quite of the easiest, but it is worth remark that planting-out has no doubt produced a superior result. The plant is a native of tropical South America. [The plant does not differ materially from that figured in the *Magazine* except in the toothed, not entire leaves. The native country is uncertain, and a casual glance in the Kew herbarium did not reveal the presence of our present plant, but the number of undetermined specimens suggests the desirability of some competent botanist undertaking a monograph of the genus. *ED.*]

NOTES FROM SOUTH CORNWALL.

AS a part of the series of articles on gardening in the southern and south-western counties, contributed by "Our Special Commissioner," we have now to add some brief notes on Cornish gardens from a specially competent observer:—

PLYMOUTH.

A pretty little park adjoining the Hoe, in Plymouth, contained two or three special features, the first being the masses of *Hydrangea Hortensis*, covered with large heads of flowers, mostly of the richest blue; the second was the equally effective groups and bushes of *Veronicas*, chiefly forms of *speciosa*; and the third a collection of tall healthy Tree Ferns behind a huge cage-like wind-screen. It occurred to me that probably other *Hydrangeas* would assume this bright blue colour under the conditions which develop it so markedly in *H. Hortensis*. Possibly they have been tried; if not, then I would recommend such sorts as *paniculata*, *altissima*, *Lindleyi*, *nigra*, *involucrata*, *quercifolia*, *Thunbergi*, and the new *Mariesii*. These are all in cultivation, and worthy of a trial in Cornwall and other places where *H. Hortensis* does so well. The

same may be said of Veronicas, of which we have now so many species, many of them decidedly decorative; but, except in a few gardens, they are not cultivated, although they all grow freely where the temperature is favourable.

CARCLEW.

Carclew, near Falmouth, the beautiful garden of Colonel Tremayne, is rich in rare and beautiful plants,

armata has stood out two years, and is a big bush, bearing a crop of fruit. Colonel Tremayne, who takes a keen interest in his garden, has decided to devote a large lake to Water-Lilies, clothing the banks with masses of Bamboos. I saw the Mlanji Cypress, Widdringtonia Whytei, looking healthy in the open air. A low wall covered with Berberidopsis corallina in full flower was in itself sufficient to make this garden famous. In the houses I saw

of bulb fanciers, if sent to one of the meetings of the Royal Horticultural Society.

PENJERRICK.

Penjerrick has for many years ranked among the most charming gardens in the south. I saw it this year for the first time. It has been the subject of frequent notices in the horticultural papers, so that I need not describe it in detail,

[FIG. 114.—BIGNONIA PURPUREA: FLOWER-LOBES ROSY-PURPLE, THROAT WHITE. FROM THE CAMBRIDGE BOTANIC GARDEN. SEE P. 398.)

mostly exceptionally well cultivated. The Rhododendrons are the great feature, many of the Himalayan species being of enormous size. As an example, I may mention R. Thomsoni, represented by a plant 14 feet high and 14 feet through; this and Embotrium coccineum, 30 feet high, with a trunk a foot in diameter, indicate the character of the garden. Lapagerias are grown on a wall, like Wistaria; Acacia

Cocos Weddelliana, with a stem not more than 2 feet high, bearing a cluster of small Cocoa-nut-like fruits; and Mr. Simmonds, the gardener, assured me that it has fruited annually for the last seven years. He showed me plants which had been raised from seeds produced by this plant. A seedling of Vallota purpurea, with flowers of a distinct pleasing shade of cerise, would, I feel certain, win the special favours

but as an example of a typical English garden it is quite an object-lesson. The size of many of the trees shows that it has been many years in forming, and credit is due to the initial designer who seized upon a well-wooded valley with a stream in the bottom, falling quickly from the house to the sea, and by a judicious use of Pine, Cedar, Cypress, Bamboo, Dracena, Rhododendron, Camellia, Acacia, Fuchsia,

Myrtle, &c., set about upon a carpet of green, or on the edge of the stream, laid the foundation of a garden of exceptional charm. Here I saw big bushes of Camellia, bearing numerous Apple-like fruits; Acacia dealbata as a tree 40 feet high, with a stem a foot through; A. verticillata, a large bush in fruit; Fuchsia globosa, 15 feet through; Araucaria brasiliensis, 20 feet high. Myrtus apiculata rose like a cloud of white flowers; whilst Falconer's Bamboo was a rich mass of bright green plumes, 20 feet through. The New Zealand Lomaria procerca looked like a mass of some Cycad. In shady nooks were big Dicksonias, and forming a turf about them, Selaginella Kraussiana (denticulata) was as happy as a Hypnum. Erica codonodes had grown to a fat bush 8 feet high; Griselinia macrophylla, to a tree 20 feet high; the Camphor-tree to an equally large size.

Among many grand Conifers I noted one of especial interest, namely, a grand specimen of Fitzroya patagonica, 30 feet high, and 15 feet through, whilst the trunk measured 2 feet in diameter. The vigour of these plants, which further north we are compelled to grow under glass, suggest the use of a host of other things that would no doubt do equally well if they could only be got out of the cramped pot and stuffy greenhouse of the botanic garden into the conditions which favour their more fortunate brethren described above. What an open-air botanic garden could be made in Falmouth, for instance!

TRELISSICK.

Trelissick, on the Fal, the garden of C. D. Gilbert, Esq., contains many objects of interest, and some lovely views. The Macartney Rose was there in full glory, covering a low wall and the ground round about with a thick cloak of rich green foliage, studded thickly all over with its beautiful white and gold star-like flowers, and equally striking fruits. A combination of the Jasmine, Solanum, and Jackman's Clematis was a picturesque jumble on a gable-end. Water gardening is here done on a large scale, and big masses of Gunnera, Bamboo, Dracæna, &c., were happy by the side of water which contained Nymphæas and thousands of white Richardias. The yellow-spated species might be tried there.

TREGOTHNAN.

Tregothnan, Lord Falmouth's residence, possesses one of the stateliest gardens I have ever seen. Rhododendrons, Camellias, Conifers, evergreen Oaks—these are represented by groups, avenues, and lawn-specimens, in all the magnificence that a wealthy proprietor, favourable conditions, and bold ideas in respect of planting and landscape effect, can realise. The main features of this garden are no doubt well known to travelling gardeners. I will therefore devote a little space to the newer efforts which, under the able care of Mr. Andrews, the gardener, promise to add to the interest of the estate. Olearia insignis, Senecio rotundifolia, two striking New Zealand plants, are doing well in the open. Lilium giganteum is established under a wall, and has flowered four times in six years, Mr. Andrews says, from the same bulb. Cyclamen persicum is planted in the grass under the trees, and promises to be as much at home there as in the greenhouse. A colony of it at the foot of two Rhododendrons, one R. Thomsoni, 14 feet high and 14 feet through; the other R. Falconeri, 16 feet high and through, as bushy as a Portugal Laurel, and as floriferous as R. ponticum (R. Falconeri had 300 trusses of bloom last year), presented a picture to make a man from the north open his eyes wide. W. W.

(To be continued.)

BELGIUM.

CHOCOLATE AS A TRAP FOR BLACKBEETLES.

At the Horticulture Internationale chocolate has been found a good means of trapping these pests. A small piece dropped into a bottle buried up to the neck in earth proves an irresistible attraction. Ch. de B.

THE CULTIVATION AND CARE OF SHRUBS, ETC.

THE negligible, or neglected, quantity in pleasure-gardens may truly be said to be the shrubberies, and especially in big places, where the difficulty of keeping work in general in a forward condition, leads in some cases to a neglect of that which is taken least account of; and so it occurs that shrubs are starved, with the result that they become unhealthy. This undesirable condition is most pronounced in those instances where the roots of trees mingle with those of the rightful occupants, and thus force on a consequent hastening to decay. In such cases cutting-over generally results in a worse state, and the only remedy is surface-dressing on a liberal scale. Hollies and Laurels I have found relish a 4 to 6-inch layer of soil or vegetable-matter in a decaying condition, the compost-heap supplying the latter. Unfortunately, the quantity of material required to be of real service negatives the use of the above if the distance to be traversed is great. A good substitute is, however, provided by the fallen leaves of the trees in the shrubbery itself; and they ought to be augmented as much as convenient by leaves gathered in its vicinity. The leaves are heaped round the shrubs to a depth, when made firm by trampling of at least 3 feet, and long before a year has past the roots and the process of natural decay have reduced these heaps to quite small proportions, whilst the vigour imparted to the shrubs is at once perceptible. The present season is the best for the carrying out of this operation.

The above is an extreme case; that which follows refers to what ought to be seen to periodically. Where collections of shrubs are cultivated, it will surely occur that a certain number will exhibit a lack of vigour not always unaccompanied by symptoms of ill-health. Foliage dwindles in size, and shoots lengthen slowly. Nor are these conditions invariably confined to worn-out specimens, but they are noticeable in the younger shrubs. I have remarked that exotic plants which find our climate verging near the utmost cold they are able to bear with impunity, are commonly affected in the manner above noted. In these instances a thin layer of fresh cow-manure laid at this season thinly over the surface of the ground, including, of course, the portion covering the roots, is generally a certain remedy. The dung may either be pointed-in the March following, or left on the ground, though I prefer to rake off the coarser portion of the material, and hack into the soil with a hoe that which remains. Unless one has seen the beneficial effects of this proceeding they can scarcely be conceived.

Variegated hardy shrubs are improved in a marked degree by annual or biennial treatment of a like nature. The foliage increases in size, and an added brilliancy of colouring follows. Soot or superphosphate of lime applied in April affects the plants in the same way, but it should be well noted, that one dressing annually is sufficient, and that there is a danger in overdoing manuring, by causing late growth, and as a result "softness," and a greater susceptibility to injury by frost. At the same time, when employed with caution, these dressings are followed by greater hardiness in the subjects treated.

Bamboos provide another example of the necessity for annual surface-dressings. Bamboos, in fact, are apparently capable of assimilating manures applied to the surface in much larger quantities than it is safe to apply to hard-wood shrubs. They do not, it is true, approach in strength or vigour those one sees in the south of England, but after a trial of a few years it is plain that Bamboos may be regarded as quite hardy in the majority of winters in Scotland. They thrive in good loam, ordinarily rich soil, and wet clay, provided they are well nourished. The species we have growing at Tynninghame, are B. Metake, B. Simonsii, and Phyllostachys nigra, the latter growing in wet soil.

In the very dry gravelly soils here, there is great difficulty in securing a rapid growth of some Conifers, as, for example, Abies Nordmanniana, A. Veitchi, A. Hookeriana, Pinus Sabiniana, and Sciadopitys verticillata, but occasional dressings applied about

this time of year cause them to grow fairly well. It is a method which is followed by the best results, whereas the digging of a trench round the trees at the extremity of the roots, the opening being filled with good compost, has scarcely any effect, either good or bad.

In the same class of soils, even when suitable material has been imported, Rhododendrons, Azaleas, and many others of a like nature are greatly benefited by annual surface-applications of cow-dung. A like treatment is invaluable in the case of hedges which either do not grow freely when young, or which exhibit signs of exhaustion when old. These remarks equally apply to Yew or other evergreen hedges as to old hedges of Whitethorn, Sweet Briar, or Roses, &c. There is almost always a dislike to cut hedges back when situated in or near pleasure-grounds, but a dressing annually applied for three or four months in winter and then removed is a certain remedy. B.

NURSERY NOTES.

GREENHOUSE RHODODENDRONS AT CHELSEA.

ON seeing the fine show of colour arranged at the entrance of the largest Rhododendron-house of Messrs. Jas. Veitch & Sons, the mind instinctively travels back to the time when of this class the only representatives found scattered here and there in gardens were R. javanicum, R. jasminiflorum, Princess Alice, and one or two others, and by comparison the magnitude of the work accomplished by the cross-breeder is grasped. Of the javanico-jasminiflorum a large number of beautiful hybrids, both single and double-flowered, have been obtained, and beyond that, the introduction of R. malayanum and R. multicolor, the last-named producing R. Mrs. Heale, the finest pure white yet obtained. Noting the most striking and attractive flowers in the showy group, our choice falls on R. Cloth of Gold, golden-yellow; Hercules, large yellow, tinged pink, and with pink stamens; Apollo, orange-salmon; luteo-roseum; Purity, fine white; jasminiflorum carminatum, rich carmine-red; Souvenir de J. H. Mangles, copper-red, rose centre; balsaminiflorum album and b. roseum, two fine double flowers; Minerva, nankeen-yellow, with pink stamens; Ophelia, salmon-rose; Primrose, pale yellow; Ceres, nankeen-yellow, a first cross of R. Teyssmani; amabile, cream-white, tinted rose; Neptune, scarlet; Princess Frederica, cream-yellow, tinted rose; Favourite, pure pink; Imogene, buff yellow; Princess Beatrice, light pinkish-yellow; Latona, straw colour; Ruby, a richly-coloured multicolour cross; Baroness Henry Schroder, the finest of the light varieties, delicate blush-white; Lord Wolseley, orange-yellow; Thetis, pinkish-nankeen colour, and scarlet crown.

ORCHIDS.

The famous collection of Orchids, while increasing in extent every year, is maintained, despite inimical conditions of London air and fog, in excellent condition as of yore. The home-raised hybrid crosses which become more numerous each year, are this autumn enriched by a fine succession of Lælia Perrin, Cattleya Bowringiana, and other autumn flowers, some of which are in bloom; while on the batches of Lælia × Latona, Lælia × Cattleya × Hippolyta, and other charming hybrids, there are signs of a continuous succession of flowers.

In the warm Cypripedium-house there is a fine show of hybrid Cypripediums; and it may be remarked that for a number of years this particular glass-house has never at any season been without a display of them. Among the handsomest now in bloom are C. × Milo (Ceanothum superbum × insignis Chantini), of the same general appearance as C. triumphans, but with more bright rose colour in the dorsal sepal. Beside it is a batch of C. × Ceanothum superbum, and plants of C. × insignis Chantini, both good and interesting to examine beside their more stately offspring.

Other remarkable plants in bloom are *C. × Arthurianum pulchellum*, distinguished by the violet spot in the upper sepal; *C. × Minozo*, *C. × Prospero*, *C. × Chas. Canham*, *C. × Harrisianum superbum*, and *C. × H. nigrum*, two old but still not superseded varieties; *C. × Niobe*, a number of the effective *C. × T. B. Haywood*, varieties of *C. × Leea*; a fine example of the true yellow *C. insigne Sanderæ*, another of the next best yellow form, *C. i. Sanderianum*; a good example of the clear, emerald-green, yellow and white *C. Lawrenceanum Hyea*; two nice batches of *C. Charlesworthi* and *C. Spicerianum*, and

mers of *D. chrysanthum*, the pretty *Spathoglottis Veillardii*; *Oncidium Lanceanum*, &c.

The *Phalenopsis-house* was filled with a splendid lot of plants in the best possible condition of *P. Stuartiana* and other favourite species, all being in fine flowering condition. As a proof that the success with these rather difficult subjects is not fitful, it may be stated that some of the earliest hybrids were present, and in splendid health, among these being *P. × Hebe*, *P. × Ludde-vioacea*, and others, throwing up flower-spikes. In the *Phalenopsis-house* there were noted some fine examples of

Forbesii, a very handsome form of *O. prætextum*, and another apparently intermediate between it and *O. curtum*, *Epidendrum Wallisii*, and other showy species, all effectively arranged.

The adjoining cool-house contains a large collection of *Cymbidium* occupying the greater part of the space. Here were some healthy plants of *C. Tracyanum*, some hybrids, *C. × Winnianum*, *C. × eburneo-Lowianum*, &c., besides a few of *C. elegans* and *C. giganteum* in bloom. Suspended from the roof in fine condition were a number of species which most gardeners would place in much higher temperature, with but indifferent results, and among them *Vanda corulea*; the blue *Dendrobium Victoria Regina*, the orange-coloured *D. subclausum*, and the nigro-hirsute *D. Lowianum*. In the warm-house, with the tank, the showier crosses of *Dendrobium*, and the rarer varieties of *D. nobile*, together with other showy specimens, were remarked.

The large *Cattleya-house* has a show of fine forms of *C. labiata*; one carefully-watched flower, which was thought would be pure white, developed a blush tint on expanding. Overhead were hundreds of *Cattleya aurea*. In bloom there were noticed only some few of *C. maxima*, *C. Bowringiana*, *C. Dormaniana*, *Lælia autumnalis*, *atro-rubens*, *L. albida*, &c.

The *Odontoglossum-houses*, in addition to having the older stock in fine condition, have some 12,000 of the *Pacho* strain of *O. crispum*, the bulk of which will for the first time flower this season, and it is hoped they will afford many good varieties. In bloom there were *O. tripudians*, *O. Pectoratorii*, *O. Uro-Skinneri*, and others; but the principal show of flowers is due to *Oncidium*s including *O. varicosum*, *O. dasytyle*, and among the last-named probable hybrid of it, and which will doubtless prove *O. præstans* which first appeared with Messrs. Veitch in 1880.

In a small glass-house a few masses of *Odontoglossum Phalenopsis*, or as it is more correctly now called, *Miltonia Phalenopsis*, in vigour were noticed.

SOME NEGLECTED GREEN-HOUSE PLANTS.

ON visiting the best and most extensive of our noblemen's gardens, one almost invariably notices the same old favourites in the conservatory. Not that I would disparage them—by any means; but what I wish is, that they may be supplemented by some of our less-known (though not less beautiful) decorative plants, suitable for furnishing a cool-house. No better example of a greenhouse with a varied collection of good flowering plants can be had than No. 4 in the Royal Gardens, Kew, and anyone interested in this class would certainly enjoy and benefit from a visit there.

But to return to my immediate subject. One of the most useful of summer and autumn-flowering plants is *Gomphrena globosa*, in its varieties, of which alba and purpurea are good examples. It forms an erect, branched growth, about 2 feet high, and bears numerous globe-shaped heads of flowers, varying in colour according to the variety. The best method of raising the plant is from seed; the first sowing should be in April, followed by others in May and June for succession. The seeds germinate readily in pans of light soil, covered with glass, and placed in the propagating-pit. When 2 or 3 inches high, the seedlings may be transferred to small 6-inch pots, putting three plants in each pot. In doing this, it is very necessary to keep them as much as possible in their various sizes, placing the small ones in the same pots, and similarly with the larger and medium-sized ones; otherwise the plants, when fully grown, will present a very uneven appearance. A temperature of 55° to 60° by night suits them well.

Trachelium coruleum grows from 2 to 3 feet high, and has rather pale blue flowers, arranged in a corymbose panicle. It is very useful in the month of August, as its flowers remain in good condition for a considerable time. A white variety is also in cultivation. *T. coruleum* is preferably propagated from cuttings taken in the autumn after flowering. When these are rooted, they may be removed from the

FIG. 115.—CHRYSANTHEMUM "GOLDEN SHOWER." (SEE P. 404.)

smaller numbers of *C. tonsum*, *C. Chamberlainianum*; various hybrids of the *Selenipedium × calurum*, and *S. × Sedeni* section; and in an adjoining house a large number of varieties of the *C. insigne montanum* class, their flowers exhibiting remarkable variation. In bloom, together with the warm-house *Cypripedium*s, were fine examples of the *Ionopsis paniculata*, *Compactia macroplectron*, and *Miltonia vexillaria Leopoldi*, a variety having pretty rose-tinted flowers, heavily marked at the base of the lip with claret colour. Some well-flowered plants of *Dendrobium bracteosum*, and its white variety, *D. bigibbum*; and some allied species were hung from the roof; *D. formosum giganteum*, a number of showy speci-

Dendrobium atro-vioaceum, with blossoms; the snow-white *Angraecum modestum*, showing flower-spikes in abundance; *Calanthes*, *Oncidium Kramerii*, *Miltonia Roezli*, and *M. R. alba*, &c.

The *Rockery-house* was, as usual, well furnished with flowering plants, including a display of a very fine strain of *Oncidium varicosum*, of which there are more than 100 plants, with flower-spikes in all stages. Standing behind these were *Sobralia × Veitchii*, the rare *S. Sanderi*, *S. xantholeuca*, &c. Other subjects in flower were *Vanda tricolor*, *V. suavis*, a pretty *Lycaste Skinneri*, the white-petalled *L. leucantha*, *Zygopetalum maxillare*, and *Z. m. Gautieri*; the elegant *Brassia Lawrenceana longissima*, *Oncidium*

propagating-frame to a cooler temperature. In spring, pot them into 48-sized pots, and grow them in a cool-house during the summer, finally shifting them when ready into 6-inch or 8-inch pots, as may be advisable.

Rivina tinctoria and *R. humilis*.—These beautiful berried plants are charming for summer decoration in the conservatory. They have one drawback, namely, that if not carefully handled, the berries very easily fall off, and stain anything they may come in contact with. Thus they would not be suitable for table decoration, nor for use in apartments; but in their proper place, the greenhouse, these plants are very attractive. The two species are easily raised from seed sown in the spring, and grow rapidly if potted in a fairly good soil, and kept in a temperature of 60° by night. It is not advisable to shade them heavily, as when fully grown, the leaves, especially those of *R. tinctoria*, take on a beautiful autumnal-like tint. This will become still more pronounced if the plants are allowed the maximum amount of light and air. *R. humilis* has numerous racemes, about 3 inches long, of bright scarlet berries. *R. tinctoria* has yellow berries, not so densely arranged in the raceme as *R. humilis*. The racemes are also not quite so long. *Harry H. Thomas.*

(To be continued.)

FORESTRY.

OUR WOODS AND FORESTS.

(Continued from p. 380.)

WHAT we need in England is not a school, but a few practical object-lessons of woodlands, which combine the ornamental and the useful in a manner adapted to the conditions under which the majority of English woods are maintained. It may be imagined that such woods are or could be plentiful enough on private estates, but such is not the case at present, nor do I see much hope of their becoming so until proprietors cease to regard the national improvement of their woods as a dangerous experiment, to try which may possibly end in a disaster to all that is most valued in them. At the present moment British forestry is beginning to realise the fact that it is more or less a failure as a commercial undertaking, and its most ardent exponents are endeavouring to rush it headlong along the lines on which continental forestry has been run for so many years, and with such success from an economic point of view. Naturally enough, a proprietor who does not regard his woods from the economic point of view, recoils in alarm at the very idea of subjecting them to any cut-and-dried "system" of timber-farming which makes no provision for ornamental features, or respect for sentiment. Rather than trust his woods in the hands of the economic forester, therefore, he prefers to go on in the old way with all its imperfections, many of which, if recognised at all, are tolerated with perfect equanimity. Such a feeling, of course, is fatal to all reform; but unless it can be demonstrated what we meant by "reform," I scarcely expect proprietors will allow it to be introduced into their woods. Unfortunately, an idea cannot be carried out, or shape given to a forestry-theory, within the course of a few years; and a feeling exists among proprietors and foresters that a system of management which embraces the remote future is outside the bounds of practical aims. This is the essential difference between State-forestry and that of the private owner. In the former, the future takes equal rank with the present; in the latter, the present over-rides the future in a greater or lesser degree. What is chiefly needed, is a recognition of certain fundamental principles which underlie a suitable system of estate wood-management, an outline of which, so far as my own views go, has already appeared in the pages of the *Gardeners' Chronicle*. To bring to maturity any such system on a private estate is almost an impossibility, and certainly cannot be properly carried out within the compass of an average life-time. But there is nothing to prevent its accomplishment on land which is not subject to change of

ownership, and its accompanying variations of individual interests. The Crown forests are eminently adapted for the demonstration of an approved system of forestry. To import the elaborate German systems of forestry into the Crown woods without any modification might not only arouse great resistance on the part of landowners, but would probably have but little effect upon the general management of estate woods throughout the country.

An essential point in the proper education of the British forester is that of keeping in view the objects for which British woods are maintained. If timber-growing be one of them, it is not the only one, and therefore the continental systems of forestry cannot be introduced intact into this country, although a great deal of what is best in them may be copied with advantage. A due appreciation of what constitutes the picturesque, combined with the technical knowledge of the economic sylviculturist, are qualifications which every proprietor ought to appreciate and require of his forester, and were this generally the case, British forestry would soon show a decided improvement. *A. C. Forbes.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Vandas.—Plants of *Vanda Kimballiana* which have ceased to flower may be placed in the coolest part of a Cattleya-house, and have very little water afforded for a few months. *V. Amesiana*, a species now showing flower-spikes, should be similarly treated, and placed in full light. The plant needs much care when being removed from one place to another, the succulent leaves being apt to snap off on being slightly touched. The plants of *V. cœrulea* should be placed in the intermediate-house, affording them plenty of ventilation: and plants that are making roots freely will require occasional light applications of water, reducing the quantity immediately the green points of the roots change colour, sufficient being afforded them to keep the leaves fresh-looking and green.

Lælias.—The flowers of *Lælia pumila* and its varieties, *L. præstans*, *L. Dayana*, and *L. marginata*, are always admired, and the plants, being of much decorative value, should be found in quantity wherever indoor plants are grown. Although this species was at one time very rare, and expensive to buy, plants may now be bought at a very low price. Plants newly imported should be placed in shallow pans, and suspended to the rafters, fixing them firmly in the pans with crocks, tying one or two of the pseudo-bulbs to the handle, in order to keep it always steady in the pan—an important fact in enabling the plant to get root-hold quickly. When the new roots begin to push forth, a small quantity only of neat and sphagnum-moss should be afforded them. The compost must never be allowed to get quite dry, and during the growing season water must be liberally supplied. Old-established plants may be afforded fresh rooting material immediately new root-growth begins. These *Lælias* should be wintered in the intermediate-house, as, if exposed to the lower temperature of the cool-house, the young breaks and leaves generally decay, although in summer they are well suited in the latter. Let the plants be closely examined for white-scale, these insects multiplying rapidly.

Cattleya-house.—It will be noticed that *Cattleya Warneri* will be showing signs of activity, both new growths and roots pushing freely; and at this period the plants should be placed in the warmest part of the house, raised up towards the light on inverted flower-pots. For the present time a very small amount of water is needed by these plants, but as growth advances so must the quantity of water be increased. The growth of the pseudo-bulbs of *C. Lawrenceana* has finished, and the plant should be placed in a very light position in order to ripen these; but the bulbs should at no time be allowed to shrivel for lack of moisture, neither should the compost be kept always wet, as this would cause these pretty subjects to decay.

Pleiones or *Indian Crocuses*, now that their requirements are better understood, are becoming popular, and considering the number of flowers produced by the plants at this season, and the nice effects which

may be obtained when they are used as table decorations, they deserve to be extensively cultivated. The greater number of them, as *P. maculata*, *P. m. alba*, *P. largenaria*, *P. concolor*, *F. præcox*, *P. Wallichiana*, and *P. burmanica*, are now going out of bloom, requiring attention forthwith as to repotting. This operation should be carried out before new roots push forth from the green shoots, out of which the flowers sprang, for as these roots lengthen quickly, some are sure to get injured if repotting is delayed. Let the plants be turned out of the pots, remove the old soil, and all dead roots and bulbs, and place the plants in shallow pots or orchid-pans, pans being more convenient for hanging up to the rafters. A 10-in. pan will hold twenty pseudo-bulbs. The pans should be filled to one half their depth with clean crocks, and over this a thin layer of sphagnum-moss should be placed, then a layer of the potting material, and upon this the base of the pseudo-bulbs should rest, filling up around them firmly with a compost consisting of equal parts of fibrous loam, peat, and sphagnum-moss, well mixed with a moderate quantity of coarse silver-sand. When re-potting it is not necessary to part every cluster of pseudo-bulbs, as is often practised, but simply to re-pot them in clusters. When done in this way the vacant spaces between the bulbs may be filled up with the roughest part of the compost, giving preference to the sphagnum-moss. Place them near to the roof-glass of the Cattleya or intermediate-house, and for a few weeks afford scarcely any or no water, but when the plants begin to grow keep the compost moist but no more, affording more as growth progresses. When thoroughly established, weak liquid-manure may be given about once in seven days. *P. humilis*, *P. Hookeriana*, and its variety *brachyglossa*, generally flower about January or February, and till that time they should be suspended close to the glass in the Odontoglossum-house, affording sufficient water to prevent the pseudo-bulbs from shrivelling. Re-potting may be done just after the plants have done flowering.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of Salisbury, Hatfield House, Herts.

The Fig-house.—The trees which are intended to ripen their fruits at the beginning of the month of May should be forthwith started to grow, and for this kind of early forcing, pot-trees are the best, these being more readily forced into growth; and small-fruited varieties are better than larger ones. The following are varieties adapted for the purpose, viz., *St. John*, *Early Violet*, *Angelique*, and *Black and White Ischias*. The trees that are in a suitable condition for forcing are those which have been established in pots for a whole year, and whose shoots are perfectly matured. Before the trees are put into the forcing-house, let them be dressed with Gishurst Compound-soap or other insecticide, and a top-dressing of loam, wood-ashes, and decayed manure given to the ball; and if there is not space to admit of this being afforded without interfering with the space left for affording water, a band of zinc 3 inches deep may be placed round the rim, resting on the soil near the edge of the pot. The Fig-house should also be well cleansed in every part, and the glass made bright, and the walls lime-washed. The bed of tree-leaves should be renewed if the Fig-trees are to be afforded bottom-heat at the start. The Fig fruits well without bottom-heat, but a start is made quicker if it be employed. Ascertain the condition of the soil in the pots, and if it is not moist, afford water in sufficient quantity, and afterwards whenever the soil approaches a dry state. The temperatures at the beginning may be 50° at night, 55° by day with fire-heat, and 10° to 15° higher with sunshine. Maintain genial forcing conditions, syringing the trees once or twice a day as may be necessary, and moistening the floors and walls. Let ventilation be afforded at the top of the house in bright weather, closing it early in the afternoon, and let this sort of treatment continue till the buds begin to push, then increase the temperature a few degrees, and afford a gradual continual rise in the heat. When bright weather allows of high temperatures being given, do not force likewise at night more than the normal. Close about 1.30 or 2 p.m.—that is, while the sun may still be shining on the house. Pot-Figs intended for late fruiting should be wintered in cold glass-houses or in frost-proof sheds, as, if left outside, the embryo fruits are liable to be hurt if the frosts are very severe.

Trees in Borders should be put in good order for starting, as for the pot-trees—that is, they should be pruned, although there will be little of

this required if disbudding and thinning were attended to in due season; and if scale, insects, or mealy-bug be present, let the shoots, &c., be washed with Gishurst's Compound-soap, or syringe or wash with water at a temperature of 150°, or 140° if the shoots are immersed therein. The Gishurst-soap ought not to be used stronger than 2 oz. to the gallon of water. Petroleum emulsion is likewise a good remedy, but it requires caution in the using, so that the oil does not float on the surface. Having dressed the trees, secure the shoots to the trellis. Old trees will need a top-dressing of materials similar to that recommended for those growing in pots and tubs.

Tomatos.—Plants raised from seed in the early autumn will now be ready for shifting into 5-inch pots, using a warmed soil consisting of loam three-quarters and leaf-mould one-quarter, with a small quantity of sand or powdered lime-rubble; afford them a moderate supply of water to settle the soil, and place them in a light place near the glass, in a temperature of about 52° at night, and 58° by day, in cloudy or very frosty weather, but higher with sun-heat, ventilating the house whenever the air is mild.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford, Kent.

Flowering Shrubs.—Of these beautiful objects in the flower garden, too rarely found in sufficient variety in English gardens of to-day, it is always advisable to buy-in and plant as many as space, without crowding, can be found for them. They may be bought-in in quantity, and planted in the nursery or reserve garden. *Kerria japonica*, with its yellow flowers; and the double variety, *flore-pleno*, the variegated-foliaged variety, are pretty shrubs in their season; then we have the *Forsythia viridissima* and *suspensa*, both having yellow flowers; *Deutzia crenata*, *gracilis*, and *Lemoine's* new varieties; *Cotoneaster Simonsii*, *microphylla*, and others. *Hibiscus syriacus*, *Viburnum* (the *Guelldres Rose*), *Hypericum* in much variety, both tall and dwarf; *Philadelphus* (mock Orange), including a number of handsome varieties; *Staphylea trifoliata*, *pinnatifida*, and *colchica*; *Syringas*, and many *Cydonias* in variety, and a great host of *Crabs* with glowing fruits of a variety of sizes. Most of the above shrubs or half trees flower in the spring and summer. Some of these plants are excellent for forming beds by themselves, covering banks, for making margins to beds of *Rhododendrons* or other shrubs, as solitary plants, or in small groups on lawn. I here mention a few of the commoner species that the planter may buy-in and plant at this season, premising that everything is done before-hand in trenching, manuring, and draining the soil to ensure success. In the matter of draining a bed on land that is insufficiently or not drained at all, a pit or dry well should be dug 8 to 10 feet deep and 4 feet in diameter, and half-filled with any hard rubbish, brickbats, stones, big flints, burrs from the garden furnaces, &c., the upper half being re-filled with the better portions of the excavated soil. Into this pit some tile or pipe-drains may lead from the bed and surrounding area, and much good will follow, the land made drier, and consequently warmer and better.

Climbing Roses.—The present time is good for the planting of *Roses* for covering arbours, fences, &c., but the plants will not succeed unless the soil has been deeply trenched and manured, and has had a considerable proportion of fresh loam incorporated with it, in order to maintain healthy, vigorous growth for many years. The following are the most suitable varieties for climbers: *Longworth Rambler*, *Caroline Pillar*, *Crimson Rambler*, *Algeria*, the *Yellow Rambler*, *Aimée Vibert*, *Félicité-Perpétue*, *Rêve d'Or*, *Madame Berard*, the *Dawson Rose*, *Madame Desprez* (enormous cluster of pink, double flowers), *Dundee Rambler*, *Alice Gray*, *Rampant*, *The Garland*, *Reine Olga de Wurtemberg*, and *Polyantha grandiflora*.

Solidago (Golden Rose).—There are few hardy herbaceous perennial plants which afford in late summer and autumn a better display in the herbaceous border than these, with their large feathery heads of pale yellow flowers. The average height of the plants is 4 to 5 feet.

Lathyrus (Everlasting Pea).—For the covering of walls and fences, these plants are very suitable, and the white variety, *L. grandiflorus albus*, is one that is, although scentless, useful for cutting; *latifolius* is the best of the red-flowering species. Good preparation of the soil is necessary for the plants, and once planted they should not be disturbed.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Fittonias.—If these pretty plants are used for indoor decorations at this season, all the spare shoots obtainable may be made into cuttings and inserted thickly together in a bed of sandy soil, or in flower-pots in the propagating-house. The heat afforded the cuttings should not be less than 80°. When *Fittonias* are employed as a furnishing for taller plants, for hiding the mould in the pots and similar purposes, well-rooted cuttings may be tied up in green moss and soil, and placed in boxes kept in the stove or other warm-house. They are then available at any time. Such plants, if kept moist, will keep in presentable condition for a considerable length of time.

Coleus.—In order to winter these plants satisfactorily at this season, place them near the light in a house having a warmth of 60°, which is kept dryish and ventilated, the amount of water afforded at the root being moderate. Small, bright-coloured *Coleus* are attractive when used for dinner-table decoration and other purposes in apartments, but their life under such conditions is short. The tops of leggy plants may be taken for propagation purposes. At this season they strike freely in bottom-heat of 75° to 80°, with top-heat of 10° less.

Ornamental-leaved Begonias.—The dwarf species and varieties have a high decorative value, and associate pleasingly with *Oplismenus Burmanni* (*Panicum*) variegatus, and similar trailing plants. Plants which have become shabby from continued employment in apartments may be cut down to the ground, and kept dryish at the root till they start anew in the spring. A good way of keeping the plants in a healthy state at this season is to place them on the ground, where drip cannot reach them, and where the conditions are such that they cannot get unduly dry. A house with a night temperature of 55°, and one by day of 65° to 70° is best for the *Begonia* either at rest or flowering at this season. For plants of foliage *Begonias* at rest very little light is necessary, and in the case of those whose stems die down in the winter, or others that have been cut down, not any is required.

Plants and Bulbs for Forcing.—The stock of *Deutzias*, *Azalea indica*, *A. mollis*, early-flowering varieties of *Rhododendron hybridum*, *Lilacs*, *Dutch Bulbs*, *Staphylea Colchica*, *Dielytra spectabilis*, and *Solomon's Seal*, may be introduced into gentle heat. In the early stage, the amount of heat afforded should not exceed 50°, more warmth being afforded when the plants have pushed their bloom-buds somewhat. *Lily of the Valley* and *Spiræas* which have been exposed to frost, may be placed in the forcing-house forthwith, a thick layer of moss being placed over the crowns, and kept moist until it is removed, when the growths push through it. *Roman Hyacinths*, *Tulips*, and *Narcissus*, should not be kept in strong heat till the flowers open, but be removed to a less warm place. The stock of *Dutch bulbs* plunged in beds of coal-ashes should be frequently examined, and all that have started removed to cold frames, and shaded from sunshine for a few days.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

The Fig.—Provision ought now be made in northern and midland shires for the protection of the *Fig* on walls, and in inland parts of Kent and in Surrey the *Fig* on south walls often get the points of the shoots killed in severe winters. A good method of protection is to loosen the tree from the wall, and tie the branches in long bundles with tarred string. When a tree is fan-trained this is easily done, four to six bundles being sufficient for a large tree. When these bundles are ready, wheat-straw should be obtained and drawn out straight as for thatching, only it must not be wetted, and with this the bundles should be wrapped round compactly, the straw to be kept in the same direction as the branches, about 2 inches in thickness, commencing at the base and working upwards; if the lower end of each layer of straw is brought well over the top of the previous layer immediately below it, moisture will run to the bottom, and pass into the soil. Each lot of straw must be tied with string before putting on more. Scarcely any frost experienced in this country will hurt trees treated in this manner. Dry bracken may be used instead of straw, or *Asparagus-haulm*, but neither keeps out moisture so well, and that is an important considera-

tion. Especial care must be taken of the points of the shoots, frost being more injurious in its effects when the protective materials are damp. The embryo-fruits for next season being situated thereon, the bundles may be secured in an upright position against the wall. Horizontally-trained *Fig*-trees are not so easily dealt with in this manner. The late R. Gilbert, when gardener at Burghley House, always used *Scarlet Runner*-sticks with the bines on them for protecting his horizontally-trained trees, and by placing them somewhat close together in front of the wall he was able to carry his *Fig*-trees safely through an ordinary winter. The points of the stakes were stuck into the ground about 18 inches distant from the foot of the wall, and long sticks were fastened horizontally near the top, and tied to the trees, which served to keep all taut and safe. Frost being severest near the ground, the stem and the principal roots should be well protected with a heap of coal-ashes, short straw or tree-leaves packed closely around. All the small fruits found at this season should be rubbed off before covering the trees, as such are usually cast off when the sap rises, and even if allowed to remain now, they exhaust the tree to no good purpose. I am aware that it is possible to ripen a few of them occasionally, but they do not make good fruits—the best *Figs* for the following season being nearly invisible at the present time.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of Wellington, Strathfieldsaye, Hants.

Peas and Broad Beans.—When the *Peas* and *Beans* sown in October show above the ground-level, choose a dry day to stir the soil on both sides of the rows, afterwards moulding them up somewhat. Sometimes mice devour the seeds just as they have germinated, and when this occurs, traps should at once be set for them. It is good practice to coat the seeds with red-lead in powder, and to sow chaff made from Furze in the drills, both of these deterring the mice. *Beans* and *Peas* being very hardy plants, no protection is required by them except in the severest weather. If the plants continue to make a little progress, moulding-up may again be practised, which will be a means of affording shelter from the wind.

French Beans.—Plants growing in pots, more especially with flowers just set, as well as others with usable pods, and those in beds in heated pits, should be carefully syringed on the under-side of the foliage on fine mornings, otherwise red-spider will do much injury to them by exhausting the juices of the leaves. The plants need now all the light possible, and should not therefore be crowded together, or kept far from the glass. Plants in bloom should not be wetted overhead, nor afforded much water at the root before the blooms set. A brisk heat, say 75° to 80°, may be afforded in the daytime, with as much air admitted to the house as the weather warrants, internal conditions being such as will forward growth without encouraging the multiplication of red-spider. Sowings may be made fortnightly. The night temperature of the *Bean*-pit may range from 60° in frosty, and 62° to 65° in mild weather.

Watercress.—The bed of *Watercress*, whether it be in running or still water, should be kept clear of floating weeds and rubbish, and the strongest growths cut off, so as to encourage young or tender shoots, for *Watercress* grows a little in mild winter weather. Fresh beds may now be made in unctuous loam, overlaid when planted with shell or other clean gravel.

The Ice-house.—Let this structure be put in readiness for filling it, removing faggots from the bottom, washing the walls, &c., and throwing it open to sweeten. The rammers and pounding-mallets, hooks, and ice-drags should be put in proper order, and a quantity of new brushwood placed handy.

General Work.—Advantage should be taken when frost has hardened the ground, to wheel manure on to vacant quarters, or stack it at easily accessible points, or to open out trenches for digging soil. Frost, which favours this kind of work, obliges the gardener to afford protection to tender kinds of vegetables or any that are liable to injury, such as late *Cauliflowers*, *Early Broccoli*, white hard *Cabbages*, *Horn Carrots*, *Couve Tronchuda*, and the like. The stores of *Potatoes*, *Onions*, and edible roots should have a close examination on days when rain or snow stays outside work. Then also is the time to paint and glaze frame-lights and hand-glasses, make labels, *Dahlia*-stakes, layering-pegs, seed-boxes, to turn over and mix *Mushroom*-bed materials, &c.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR DECEMBER.

MONDAY,	DEC. 5	Smithfield Club Show, at the Agricultural Hall, Islington, N. (four days).
TUESDAY,	DEC. 6	National Chrysanthemum Society's Exhibition (three days). Meeting of the Floral Committee on Tuesday. Scottish Horticultural Association Meeting.
TUESDAY,	DEC. 13	Royal Horticultural Society's Committee Meeting.
MONDAY,	DEC. 19	National Chrysanthemum Society's General Committee Meet.

SALES FOR THE ENSUING WEEK.

MONDAY,	DEC. 5	Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	DEC. 6	Dutch Bulbs, at Protheroe & Morris' Rooms. Great Trade Sale of Fruit Trees and other Stock, at the Cart House Lane Nursery, Horsell, near Woking, by order of Mr. R. Collyer, by Protheroe & Morris.
WEDNESDAY,	DEC. 7	Dutch Bulbs, Roses, &c., at Protheroe & Morris' Rooms. Great Sale of Fruit Trees and other stock, by order of Messrs. S. Spooner & Sons, at the Wellington Road Nursery, Hounslow, by Protheroe & Morris (3 days).
THURSDAY,	DEC. 8	Dutch Bulbs at Protheroe & Morris' Rooms.
FRIDAY,	DEC. 9	Dutch Bulbs at Protheroe & Morris' Rooms. Orchids at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—41°.

ACTUAL TEMPERATURES:—

LONDON.—November 30 (6 P.M.): Max., 48°; Min., 35°. PROVINCES.—November 30 (6 P.M.): Max., 52°, W. Ireland; Min., 39°, E. Scotland. Dull, rainy, windy; slight frosts.

Chrysanthemums.

THE meeting of the Royal Horticultural Society on the 22nd ult., reported in these columns in our last issue, though relatively small, was one of great interest and specially instructive. We allude especially to the Chrysanthemums. Although the number of exhibits was small in comparison to the magnificent displays at the Aquarium, yet the opportunity for inspecting these glorious autumn flowers, for observing their peculiarities, and for appreciating their decorative value under favourable conditions, was in many respects better than could be obtained at the larger exhibition. Mr. NORMAN DAVIS, Mr. WELLS, Mr. GODFREY, and many others whose names are recorded in our previous issue, exhibited cut-flowers and decorative groups, which enabled the visitor to see at a glance representatives of the various types which have been gradually evolved from the original single-flowered form (as illustrated in an article on the evolution of the Chrysanthemum in our columns, November 30, 1880), and illustrations of the manner in which the flowers may be used for decorative purposes.

The marvellous variety of form, the brilliancy of colour, the astonishing progress that has been made by the art and skill of the cultivator, were excellently illustrated. It was most interesting and most instructive to see how the old artificial and incongruous "standard of properties" so dear to the florist of the olden time has been broken down by the variety and the

natural beauty of the newer candidates for public favour. The standard is no longer, at any rate in the case of the Chrysanthemum, a merely arbitrary one, but is consistent with the natural growth, habit, and conformation of the flower, and in conformity with the natural powers of variation exhibited in so marked a degree by the Chrysanthemum; for it must be remembered that here we are dealing not with hybrids between two species, but with variations from one species only.

The decadence of the incurved type is an instance in point. No one can deny some amount of beauty in the old incurved forms, and the skill of the grower was very remarkable, but the result was formal and artificial to a degree; so that whilst we were always glad to see what could be done in this direction, as a matter of curiosity, the excessive formality became repellent rather than attractive. A flower should be a flower, inimitable save by another flower. The ultra regular blooms might, as far as appearance goes, be cut out of paper.

It is to the introduction of the Japanese varieties that we owe our liberation from the old rigid formality which became so distasteful to some of us. Among these Japanese forms great progress has been made. Some of the first which reached this country were figured in our columns so long ago as June 15, 1861, p. 550. The types remain the same, but the development of the type has been most marked. In our present issue we give illustrations, somewhat idealised, it must be admitted, of certain forms which were exhibited by Mr. WITTY. "They are truly extraordinary, but they are only highly developed illustrations of the types figured by us thirty-seven years ago. The raiser of novelties, particularly if he procures his seed from Japan, or from Japanese varieties, occasionally secures some of these extraordinary forms. He introduces to the public only those that he supposes will be useful for exhibition or decorative purposes, and which, upon the whole, and to the ordinary observer, have fairly regular flowers; though, of course, all of them, botanically, are more or less irregular. But the numberless seedlings that are thrown away as soon as they have produced their first flowers, doubtless include many that would be interesting to the botanist, and though of the nature of monstrosities, they would be welcome to some cultivators.

The flowers figured in our present issue represent two varieties that have been raised by Mr. J. H. WITTY, Superintendent of the Nunhead Cemetery, from seed obtained direct from Japan. "What Ho!" (fig. 116, p. 405) has long, drooping, tubular ray-florets, that curl at the tips; and it is curious to note from the illustrations of the buds given, that this characteristic is quite evident immediately the florets emerge from the flower-head, and before they have acquired a fifth part of their length. Our artist has made a pretty picture of the flower, but it is scarcely probable that will have any value as a decorative plant.

In the case of "Golden Shower" (fig. 115, p. 401), the case may be different. Indeed, the Floral Committee of the Royal Horticultural Society have already bestowed an Award of Merit upon the variety, which will afford novel and attractive flowers for decorative effects. The thread-like florets are mostly golden-yellow, but some are red.

In "Golden Shower" the long thread-like florets are really flattish ribbons (ligules), and the receptacle or dome-shaped cushion from which the florets spring is thickly covered

with membranous pointed bracts—one to each floret.

In "What Ho!" the florets are long tubes, some spreading at right angles, others more or less pendulous. The exigencies of our space have compelled the artist to show more of the latter than of the former. But the curious point botanically is, that the receptacle is quite devoid of the bracts mentioned in "Golden Shower." The presence or the absence of these bracts will probably not be noticed by the ordinary cultivator unless his attention be drawn to it, but for the botanist these peculiarities will be considered as of greater importance than the variation in the form of the corollas. There is apparently considerable variation in the size of these bracts in different varieties.

OUR ALMANAC.—According to our usual practice, we shall issue a *Gardeners' Chronicle* Almanac with our first issue in the New Year. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and allied Societies, or any of our correspondents, will send us immediate intimation of all fixtures for 1899.

LINNEAN SOCIETY.—On the occasion of the meeting of this Society on Thursday, November 17, Dr. A. GÜNTHER, F.R.S., President, in the chair; in addition to various papers interesting to zoologists, Mr. SPENCER LE M. MOORE, F.L.S., read a paper entitled "The Botanical Results of a Journey into the interior of Western Australia; with some Observations on the Nature and Relations of the Desert Flora, and on the probable Origin of the Australian Flora as a whole." The author briefly sketched the physical and botanical features of the West Australian desert, indicating the parallel of 30° south, as, at least, in the Coolgardie district, the dividing-line between two subfloras. Flowering takes place almost entirely in springtime, when alone the conditions are favourable to it. Statistics of the desert-flora were then given. These comprise 867 known species, of which 860 are Phanerogams, referable to 319 genera, distributed among seventy-three natural orders. Of the flora, 58 per cent. consist of species ranged under eight orders, with Compositæ and Leguminosæ heading the list, leaving 42 per cent. to be shared between the remaining sixty-five orders. The author disbelieved the current theory of Scandinavian predominance; and the prevalence in Eastern Australia of forms of Indo-Malayan facies was held to be due, in great measure, not to immigration, but to descent from the primitive tertiary flora. Moreover, the balance of exchange between Indo-Malaya and Australia in favour of the former area, was considered as coming under the doctrine of chances, and not as implying any inherent superiority of the one flora over the other. While in Europe the Australian, i.e., the xerophilous element was, owing to change in climate, eliminated in favour of the present hygrophilous vegetation, in Eastern Australia the conditions remained as they were in earlier tertiary times until desiccation set in. He held that this desiccation dates from an earlier period in Western Australia; and that this, together with the isolation of the western portion of the continent in secondary times by a sea, and later by stretches of desert, explains the floristic difference between the two halves of Australia.

THE ROYAL GARDENERS' ORPHAN FUND.—We are requested by Mr. A. F. BARRON, Secretary, to state that the next election of children to the benefits of this Fund, consisting of an allowance of 5s. per week until they attain the age of 14 years, will take place early in February. All applications must be made on a printed form, copies of which may be obtained gratis from the Secretary, or any of the local secretaries. Such forms must be correctly filled up, duly signed, and returned to the office by Tuesday, December 20, 1898.

—A meeting of the Executive Committee was held at the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on the 25th ult. Mr. A. W. G. WEEKS presiding in the unavoidable absence

FIG. 116.—CHRYSANTHEMUM "WHAT H!"; COLOUR OF FLOWER YELLOW AND RED. (SEE P. 404.)

of Mr. W. MARSHALL. There was, as usual, a good attendance of members. The following special donations, &c., were announced:—Mr. W. Bryant, sale of flowers at the Rugby Chrysanthemum Society's show, £7 5s.; Mr. J. Hughes, Birmingham box, £4 3s. 4d.; The Sevenoaks Gardeners' Society, per Mr. Cooke, £4; Mr. R. Scott, Bradford box, £1 10s.; Messrs. G. Bunyard & Co., Maidstone, £1 5s. 2d.; Mr. W. Bates, Twickenham box, £1 4s. 6d.; and the Chiswick Gardeners' Society box, 10s. It was announced that Mr. WILLIAM NUTTING has consented to take the chair at the social supper, to take place on the evening of the annual meeting on February 17 next, at Arderton's Hotel.

NATIONAL ROSE SOCIETY.—We are requested to state that the twenty-second annual general meeting of the National Rose Society will take place at the Rooms of the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Thursday, December 8, at 3.30 P.M. Proposed new regulation: "In the three Trophy classes at the Metropolitan Exhibition, and in the two Trophy classes at the Provincial Exhibition, the blooms must be staged in boxes of the following dimensions, viz: twenty-four blooms in boxes 3 feet 6 inches long by 1 foot 6 inches wide, and eighteen blooms in boxes 2 feet 8 inches long by 1 foot 6 inches wide, all outside measurements."—A meeting of the Committee will be held immediately after the annual general meeting, to elect the general Purposes Committee for the ensuing year.—The twenty-second annual dinner of the National Rose Society will take place at the same place at 5.30 P.M., R. B. CATER, Esq., President of the Bath Floral Fête Committee, in the chair. Gentlemen intending to be present at the latter function are requested to communicate either with the Rev. H. H. D'CMBRAIN or Mr. EDWARD MAWLEY, Hon. Secretaries.

INTERNATIONAL EXHIBITION, ST. PETERSBURG.—We have received from the Russian Government copies of the schedule of the proposed exhibition which is to be held in St. Petersburg from May 5/17, to May 15/27 next. The President of the foreign section is Professor FISCHER DE WALDHEIM, Imperial Botanic Garden, St. Petersburg.

THE MILAN CHRYSANTHEMUM SHOW.—On the occasion of the first annual exhibition of the Italian National Chrysanthemum Society, the executive issued a very neatly-printed special number of its journal, *Il Crisantemo*. The idea is something similar to the American exhibition souvenir, and visitors will certainly preserve this special issue as a keepsake of a very interesting event. A large portion of the literary matter relates to the Society itself, while other matter includes numerous articles connected with the culture of the Chrysanthemum, its origin, &c. There are several portraits of the leading officials of the Society, of whom Mr. A. SCALARANDIS, gardener to the KING, and President of the Italian Society, is a welcome addition to the published portraits of Chrysanthemum celebrities. The work is very neatly printed, and is enclosed in a coloured wrapper bearing upon the front an artistic allegorical figure of a Cupid distributing cut blooms of the flower which the Society is intended to honour. It is interesting to note that the list of members is rapidly increasing, and that the Society is receiving support from growers in many other countries.

MR. WHITTALL, to whom our gardens are indebted for many introductions from Asia Minor, was recently captured by brigands in the neighbourhood of Smyrna, but was released on Saturday evening. The SULTAN, on hearing of his capture, immediately sent orders to the Vali of Smyrna to do all in his power to procure Mr. WHITTALL's release, and even, if necessary, to pay the ransom demanded by the brigands.

ROYAL BOTANIC SOCIETY.—A meeting of the Fellows of the Royal Botanic Society was held on Saturday, 26th ult., at the Gardens of the Society, Regent's Park, Major J. W. M. COTTON in the chair.

New Fellows to the number of sixteen were elected, and the names of seventeen others were read for ballot at the next meeting. It was decided by the council to extend the series of musical evening promenades in the conservatories in connection with the Fellows' dinners at the new club rooms on December 7 and 14.

A CORNISH GIFT TO THE NATION.—A magnificent batch of Indian Rhododendrons is being sent from the gardens of Tremough, near Penryn, by Mr. D. H. SHILSON, as a present to the Royal Gardens at Kew. The group numbers about twenty, and some of them are of such gigantic proportions as to require a separate truck for each specimen. The assistant-curator of Kew is superintending their removal, and they are to be placed in the new wing of the temperate-house, specially built to receive them. Tremough has been long noted for its Indian Rhododendrons, and those who have had the pleasure of seeing them from time to time will feel gratified that Mr. SHILSON's generous offer was accepted by the authorities, as also will Mr. RICHARD GILL, the gardener at Tremough, under whose care and supervision they have been reared.

A LIQUID FERTILISER FOR CHRYSANTHEMUMS.—The following preparation after a formula given by Professor PAUL WAGNER, director of the German Experiment Station at Darmstadt is recommended in the special Chrysanthemum number of the *American Florist*, by a writer who has used it with satisfactory results during three seasons. It is called Wagner's Solution, and is prepared as follows:—

Phosphate of ammonia, 2 oz.
Nitrate of soda, 1½ oz.
Nitrate of potash, 1½ oz.
Sulphate of ammonia, 1½ oz.
Water, 50 gallons.

The cost of the ingredients is very small, and the preparation, says the writer, is an excellent liquid fertilizer for other plants as well as Chrysanthemums.

JAPANESE PLANTS FOR AMERICA.—An English M.P., who is at present "on his travels," and who recently crossed from Victoria, B.C., to Yeddo on board ship, met with an official from the Government Botanical Department at Washington, U.S., who had been commissioned to select in Japan such plants as may be found suited for various localities in such of the States as promise success for the experiment of transplanting. We shall hope to hear more of this anon.

INDIAN-CORN CROPS OF THE UNITED STATES.—Owing to certain difficulties in collecting the necessary statistics, the complete crop returns for the present year have only lately been published. From these statistics we condense the following note. Of Indian-corn, we are told there was an average yield of 24.8 bushels per acre, as compared with 23.7 bushels in November of last year. The average as to quality is 82.7 per cent., compared with 86.3 per cent. in November, 1897. It is estimated that 7.25 per cent. of the crop of 1897 was in the hands of the farmers on November 1, 1897.

MR. PETER BARR, who is still in America, has fallen a prey to the interviewer. In the *Rochester Herald* (U.S.A.), is an account of an interview a representative of that paper has had in relation to the Rochester Public Parks, and in a minor degree to the general aspect of horticulture in the States. Mr. BARR states that he has visited all of the parks in most of the Western cities, and has just come from Buffalo. The great feature of the American parks is the originality that has been displayed by the landscape gardener. You cannot, says Mr. BARR, compare the parks of any two of the American cities. Highland Park, Rochester, however, appears to have given the tourist especial pleasure, as the following quotation shows:—"It (Highland Park) is more like a botanic garden than a park, differing only in arrangement. Its beauty rests in its being planted with the idea of obtaining good effects, with a natural classification of plants." But subsequently is the following criticism:—"But you need good carriage-

roads here. You are weak in your boulevards. You seem to be too tight on your purses in this respect." Mr. BARR has promised to obtain for the Highland Park a collection of European Pæonies. Mr. BARR was then on his way to New York. He will then go to Canada, and afterwards to California.

PERSIMMONS.—This tropical fruit is getting commoner in our markets than was the case a few years ago. Numbers of well-developed fruits of the size of an ordinary St. Michael Orange, but rather flatter at the top and bottom, were this week remarked in several fruiterers' shops in Covent Garden Market in a state fit for immediate consumption. Now that it is known that, like the fruits of the Medlar and *Sorbus domestica*, it has to be ripened (bletted), and the consumption of it not attempted in the very inviting brilliant red dress of maturity, people will acquire a liking for Persimmons. The fruit now imported come from the Canary Islands, the cultivation of the tree having been taken up by the natives. We hope soon to hear of consignments from some of the West India Islands.

EXTENSIONS OF BRENTFORD MARKET.—The Brentford District Council, upon the recommendation of the Markets' Committee, have decided to extend the Kew Bridge Flower and Vegetable Market at an outlay of over £3000. A large piece of land at the rear of the market is to be acquired and laid out—paved, kerbed, and fully drained and lighted, to be used as stands for sellers and buyers. By this addition the extent of the market will be just double what it was when opened about six years ago.

ALLOTMENTS AT WALLINGTON.—The Surrey County Council, upon the recommendation of its Allotments' Committee, have issued an order permitting the sale of land at Beddington by the Croydon Rural District Council, in order to provide the fund for the purchase of 3½ acres of land at Wallington, Surrey, to be used as allotments. Originally, under the Allotments Act, 7 acres of land at Bandon Hill, Beddington, were acquired by the Croydon Council, for allotments, but subsequently it was found that the site was less suitable than that at Wallington, and they sought powers to sell the former to enable the acquisition of the latter. The new land is approached by an occupation road 10 feet wide, and in other respects it is very suitable for its purpose.

"CHEMISTRY IN DAILY LIFE."—Popular lectures by Dr. LASSAR COHN, translated by M. M. PATTISON MUIR. (London: H. GREVEL & Co., 33, King Street, Covent Garden.)—That the everyday occurrences of eating a meal and lighting a candle involve complicated chemical actions we are nowadays assured by many popular instruction books, upon which the volume before us is a great improvement and advance. It is not wholly elementary, yet not so technical as to dismay any reasonably intelligent reader; it is not a bare-faced compilation from the works of others, and it is brought thoroughly up to date. Its somewhat disconnected style is attributable to the fact that the matter was originally delivered in the form of lectures, so that the chapters pass from argon to matches, from plant-food to cheese, and so on, with but little apparent connection. Dr. COHN is fortunate in finding an able translator in Mr. MUIR, who has supplied the correct English versions of technical words and phrases, and added notes where these are rendered necessary by the German customs or idioms. There are a few illustrations, not especially valuable or original. We read that "These lectures, and the publication of them in book form, caused quite a stir in German circles," and the translation is likely also to prove acceptable, being already in its second edition. It is decidedly one of the best books of its kind, and one we should like to see on the shelves of every garden library.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Reigate and District Chrysanthemum Society have, as the Secretary informs us, forwarded through Mr. J. BROWN a donation of £21 to the funds of this Institution.

THE ROYAL SOCIETY.—The annual meeting of the Royal Society was held on Wednesday last, the President, Lord LISTER, in the chair. The feature of special interest to those concerned in any way with vegetable physiology was the award of a "Royal Medal" to Mr. WALTER GARDINER, in recognition of his discovery of the continuity of protoplasm from cell to cell of the plant. The researches and discoveries of later years have amply confirmed the original assertions of Mr. GARDINER, and our ideas of the nature of a plant as of a series of more or less independent cells, has to be replaced by the idea that a plant is one body throughout which the protoplasm is continuous. We were glad to see that the old plan of calling up the medallists to receive their medals as if they were school-boys called up to receive their prizes, has been superseded, and a more dignified procedure adopted. The medallists are now escorted with some little show of ceremony by the secretaries to the President, who makes the presentation.

of Grapes on boards. The space allotted to each exhibitor will be severely limited. Because early in the season flavour is not to be prominently regarded, it is hoped that judges will be less influenced by mere size of bunch than by size, finish, and colour of the berry, for often these points are the primary tests of cultivation.

PUBLICATIONS RECEIVED.—*Transactions of the Edinburgh Field Naturalists' and Microscopical Society*. Session, 1897-98. The contents include the following papers:—"Illustration of Birds' Nests by Photography," Mr. H. Raeburn; "Microscopic Life," Miss Sprague; "Microscopy and some of its Uses," Mr. W. Blacklock, &c.; and "Diatomaceæ," Mr. J. Russell; "A few Rare Mosses," Mr. A. Murray; "Plants which dissipate Energy," Mr. W. C. Crawford; and other articles.—Among recently-issued books to which it will be our duty to refer at greater length hereafter are: The fourth part of the *Handbook Flora of Ceylon*, commenced by the late Dr. Trimen,

Roses," by George Paul.—*Agricultural Gazette of New South Wales*, September.—*Journal Horticole Japonais* (Journal of the Japanese Horticultural Society), September.—From the Board of Agriculture, 4, Whitehall Place, S.W., Leaflets—50, *Water Wagtails or Dish-washers*; 51, *The White or Barn Owl*; 52, *Gooseberry-Blight*; and 53, *The Pear-Midge*.—*Bulletin of the Botanical Department, Jamaica*, October. This includes "Agriculture of the Sugar-cane, IV.;" "Entomological Notes;" and "Co-operative Farming"—*Origin of Gymnosperms and the Seed Habit* (Botanical Society of America), by John M. Coulter.

HOME CORRESPONDENCE.

THE CHRYSANTHEMUM-RUST.—Information in respect to the Chrysanthemum-rust has been eagerly sought after during the past two months by nearly all growers of the Chrysanthemum in Guernsey. It was remarked for the first time this year, and now there are very few collections in the island, if any, that are not affected. It is prevalent on plants in the ground, as well as in pots. In some cases, the stems are naked, and the rust has affected these as well as the leaves. The malady, in one or two instances, destroyed the foliage in a month from the time it was first noticed, and the flowers, of course, are useless. The varieties mostly infested are The Queen, Souvenir de Petite Amie, Modesto, Adm. Sir T. Symonds, Niveum, Stressa, Mdle. Lucie Faure, Yanoma, Phœbus, and Miss Ethel Addison. Syringing the plants with petroleum, at the rate of about one wineglassful to two gallons of water, has had but little effect, if any, in checking the progress of the disease. Yet some of your correspondents say that they have got rid of it with petroleum used as above, but a much weaker solution. It seems that the prevailing opinion is, "that it cannot be killed;" and the best way to combat it is by using fungicides in the growing-season (either as a spray or a powdery-dusting) as a preventive. This was the conclusion arrived at by the Guernsey Gardeners' Mutual Improvement Association at a meeting on November 8. *W. M. Cameron, Hon. Sec.*

BEGONIA GLOIRE DE LORRAINE.—Too much cannot be said in favour of this comparatively new Begonia, or of its value as a winter-blooming plant. During a visit to the Blandford Chrysanthemum Show, I remarked six very fine specimens which were about 3 feet in height and diameter, and covered with flowers. These fine examples of good cultivation came from Viscount Portman's garden, Blandford; Mr. Alsopp, his lordship's gardener, exhibiting them not for competition. Some readers of this note would be glad to learn from Mr. Alsopp his methods of growing this useful variety. *W. J. Grace, gr. at Bickton, Fordingbridge.*

GAURA LINDHEIMERI.—In a recent issue of the *Gardeners' Chronicle* a note appeared from the Rev. Wolley Dod in praise of this plant. We grew it here for the first time last season, and I am sure that were its merits better known it would be more generally cultivated. Associated with hardy plants in the mixed border it had a very pretty effect, and its slender sprays of pure white blossoms were swayed in a charming manner by the least breeze. If it be planted in groups of half-a-dozen together, it will form nice clumps, that will give numerous flowering-stems from 2 to 3 feet high. These will continue to open successive flowers until checked by frost. Seeds were sown during March, and the young plants were treated in a similar manner to half-hardy annuals prior to being planted-out during May. Paxton describes a variety as having red flowers, and does not mention a white one. I should be very glad to know if there are other worthy varieties obtainable. Perhaps Mr. Wolley Dod can kindly tell us? *W. H. Lees, Trent Park Gardens.*

STAKING CARNATIONS.—We have several clumps of free-growing Carnations in our herbaceous border, which is exposed more or less to rabbits. As will be known to your readers, these destructive creatures in gardens and grounds have a special liking for Carnations. With a view to protecting them, we enclosed the plants with stout lengths of galvanised wire about 20 inches in height. Some of these were left during the summer. The Carnations were

FIG. 117.—BALLENORA PIPPIN: A NEW DESSERT VARIETY OF A DEEP RED COLOUR. IN SEASON IN OCTOBER.

It was shown by Messrs. R. Hartland & Son, Lough Nurseries, Cork, at the Royal Horticultural Society's Meeting, Nov. 22. (For full description of the fruit, see *Gardeners' Chronicle*, November 26, 1898, p. 391.)

A GREAT GRAPE CLASS.—Growers of fine exhibition Grapes will have a splendid opportunity offered to distinguish themselves at the great Shrewsbury show next August, when the executive of the Shropshire Horticultural Society in commemoration of the show of 1899 being the twenty-fifth promoted by the society, will offer in a class for twelve bunches of Grapes in six varieties, two bunches of each, the magnificent sum of £100. This will be, indeed, a record class, but as it is intended to create a commemorative effort, such astonishing liberality may be commended. The result should be a splendid competition, as this large sum will be divided into a good number of prizes. The special object of prize-giving should be to reward good culture and excellent examples generally. The Grapes are to be judged by the Royal Horticultural Society's code of judging scale of points, and whilst each bunch will receive in this way its full meed of merit, a maximum of eight points will be given for decorative effect in staging, as a few plants and some pleasing foliage may be utilised for this purpose. This is, of course, new in relation to the exhibiting

and continued by Sir Joseph Hooker.—*A List of Plants from Formosa*, by Dr. Augustine Henry.—*A History of European Discoveries in China*, by Dr. E. Bretschneider: two vols. and maps. (Sampson Low, Marston & Co).—*Primitive Flora Costaricensis* (Polypetalæ, by J. Donnell Smith), edited by H. Pittier.—*Abstract of Report of the British Pteridological Society*. This mentions the seventh annual meeting of the Society, held last August, and reports the papers read on: "Ferns as Pet Plants," by C. T. Druery; "Fern-growing in Towns," W. H. Atkinson; and "Polystichum angulare proliferum," by W. H. Phillips.—*Hints on Growing Roses*, and *Report of Conferences held by the National Rose Society in 1898 on Pruning and Exhibiting Roses*. The former of these booklets is a second edition of a most useful set of instructions "not intended for experienced rosarians, but for that numerous class who wish to grow Roses, but do not know how to set about doing so." The Report includes papers read at the Rose Conference last June on "How different kinds of Roses should be Pruned," by W. F. Cooling; and "Exhibiting

planted on low mounds; as the flower-stems grew some of them were led through the meshes of the wire, but the bulk of them were in the centres of the clumps. I have never seen Carnations look so well as these did. One great advantage of growing Carnation-trees is that when cutting the flowers for room or other decoration there is no time lost in removing ties from the supports, as none is used. The wire was mostly covered by the stems and flowers when fully developed, and consequently was but little seen. *H. J. C.*

YOUNG GARDENERS AND THE ROYAL HORTICULTURAL SOCIETY'S EXAMINATIONS.—I do not think it would be wise to alter the conditions of these examinations, but let gardeners and college students be examined together as before. It is a much greater honour to gain a certificate in an open class. If one wishes to succeed in an examination, one must work for it. Garden literature is free to all, but young gardeners can be greatly assisted by professional help in the "Coaching by Correspondence" classes, and if they do not actually score at the examinations, they will certainly have more knowledge than previously. I gained a First-class Certificate in 1897. There were many college students before me, and many behind me. I contemplated sitting for the examination several years ago, and at that time took part in a discussion in this Journal, under the heading, "Subjects of Study for Young Gardeners." I would strongly advise young gardeners to prepare for these examinations, and, "if at first they don't succeed, try, try again." *A Certificated Gardener.*

— This is a subject in which young gardeners ought to have a special interest. I cannot agree with your correspondent "P.," for I think a competitive examination is, on the whole, best. I think it would be very much appreciated if the committee of the R. H. S. could award a gold medal to the most successful candidate each year. Could not one gold medal per year be thus afforded by the R. H. S. to the younger members of the profession? As another intending competitor, I respectfully offer this suggestion for the consideration of the Society; and I venture to think that should it be adopted, that medal would not always be won by a college-trained candidate. *King Coyle.*

— Of the several correspondents who have written on the subject of the Royal Horticultural Society's examinations, none seems to have the same reasons for being dissatisfied with the way these are conducted that I have. In paragraph 5 of the instructions to candidates the following sentence occurs: "But arrangements will be made, as far as possible, to frame the questions so as to cover the ground of any syllabus sent up for that purpose." I consider this very unfair to those who cannot attend lectures or classes, and can only work from the instructions sent by the Society. Therein lies the secret why so many college students pass first-class. Granted a fair field and no favour, I think many a gardener would obtain a place in the first-class list instead of as now second and third. *Tot homines, tot sententiae.*

ROYAL SOVEREIGN STRAWBERRY.—When a market grower of Grapes embarks in Strawberry culture for market, and layers some 12,000 plants into pots for gentle forcing under glass, it shows a good deal of confidence in the variety when this huge batch is limited to that one alone. That is the case with Mr. Bennett, of Cobham, Surrey, who not having grown Strawberries before has shown his entire confidence in Royal Sovereign by having this large number of the variety laid down. Really, the batch of plants is a remarkable one, for out of the thousands not one plant seems better or worse than another, and every one looks as if an exact duplicate of its neighbour. All were obtained from a breadth of rather late and not over-rooted plants put out the previous autumn in good ground, expressly to produce runners early, and all were laid direct into the fruiting-pots, large 32's. Thus there has been no second potting. The soil now in the pots is very firm, and is full of fibrous roots. Foliage stout, leathery, and borne on rather shorter leaf-stalks than is seen after a second potting, and the crowns stout and plump. Probably there is no other Strawberry in commerce over which so much would be risked as Royal Sovereign. The plants will not be early forced. There is ample room at Cobham to have 2000 or 3000 fruiting at once, and the object of the grower is to have plenty of fruit as the time for outdoor-produce draws on, as that is the best season. It is interesting to note, that at this place six huge span-houses having lately

been added for Grape-culture, and all for Gros Colman; that six other huge spans are being erected for Peach and Nectarine-culture. Evidently glass fruit-culture is not yet going to the dogs. *A. D.*

EUCALYPTUS GLOBULUS.—I quite agree with "T. H. D." in his remarks as to the rarity or difficulty of growing this plant. Here, we have plants 16 to 18 feet high, that have withstood five winters without the slightest protection whatever, and this last summer I was assured by a friend of mine (one of the Colonial troopers from Australia) that they were as good as any of their size in their native habitat, and delighted him more than anything else in the garden. In my opinion the principal cause of failure to grow them is planting too soon. Plants from seed sown in early spring should be grown on till they come into 6-inch pots, which should be wintered in a greenhouse, and planted in the late spring, in good, well-drained soil, when they will attain a good size, and have good firm wood to enable them to withstand the winters. Yearling plants are too soft to withstand cold, and to plant them is to court failure. I have now about 100 plants ready to go out into the woods and shrubberies in the spring; among them a few plants of *E. Gunni*, which I am going to try. *C. Bailey, Windlestone Gardens, Durham.*

LADYBIRDS AND APHIS.—The usefulness of the above pretty little beetle on plants infested by aphis is a matter of common knowledge. My attention was first drawn to them this summer by the absence of insects on Chrysanthemums where ladybirds abound. After close observation it was seen that they left plants that were cleared, and took up their abode again on plants affected. I stood two plants infested by aphis apart from the general collection (both had the pretty little destroyer upon them), and in a week's time both aphis and ladybirds had disappeared. Being thus convinced of their usefulness, I assisted them in their work of destruction by conveying them from plant to plant, with the result that the stock of insects invariably diminished. I may mention the ladybirds were pretty numerous. I cannot say whether they devour aphis, or whether their presence is objectionable; they are certainly to be encouraged. Can any of your readers kindly enlighten me? *H. C., Blackley.*

EICHHORNIA CRASSIPES.—A correspondent writes from St. Augustine, Florida, U.S.A.:—"A water-plant is giving us a great deal of trouble on the St. John's River. It grows so rapidly that, forming large floating masses, frequently of many acres in extent, it seriously interferes with navigation. It grows 2 to 4 feet high, and the roots extend 2 to 4 feet below the surface of the water. How can we exterminate it? So far we know that salt-water or sharp frosts will kill it, but nothing else so far as yet tried is any success. Can you suggest anything which would hinder its propagation? The problem is a serious one, and is bothering both the Department of Agriculture, and the Engineer Department. From another source we learn that the plant is also called *Pontederia crassipes*, and is similar in appearance to the common pickerel-weed, generally known in the South as Wampsee. Instead of the heart-shaped leaf of the Wampsee, its leaves are broad, lance-shaped, nearly circular. The stems of the leaves are generally enlarged at the water-surface into curious oval bulbs, filled with air-cells, which evidently serve the double purpose of adding buoyancy to the plant and strength to the stem. The flower is very showy, being of a lilac-rose colour, with a yellow spot on the uppermost petal. The individual flowers are about 1½ inch in diameter. They are formed on the central stem in the shape of a spike about 5 inches in length. The roots are numerous, and have a central wire-like stem, from all sides of which feathery filaments project from ½ to 1 inch in length." *W. T. T.*

EATON HALL.

THE seat of the Duke of Westminster at Eaton Hall, near Chester, has been described as a "princely establishment," and such it really is. Eaton, as a private residence, is a wonder. All that money can buy, or skill effect, has been requisitioned in the building and furnishing of the mansion, and the ornamentation of the grounds. And there is no want of uniformity at Eaton. One feature has not been produced at the expense of others, but there is splendour in all, expensiveness in all, design in every detail, grandeur in the pleasure-grounds, in the mansion—everywhere. But it is diffi-

cult to define the degree of quality in words. We lovers of horticulture, that are writers also, have frequently to give well-merited praise to gardens of infinitely less pretensions than Eaton, and occasionally, perhaps, our admiration leads us to speak of them in the superlative degree. Were there a fourth degree, we should unhesitatingly use it in the present case.

Eaton Hall is about four miles from Chester, and there being two ways of reaching the establishment from that city, and either way an enjoyable one, I proceeded by one and returned by the other. My drive outwards led through the pretty little village and near to the church of Ecclestone, where the Dukes of Westminster find their last resting-place, thence to the park gates and the gardens. To gaze for the first time upon the magnificent mansion of polished stone that the present Duke of Westminster has built for himself and his successors, is an experience to be remembered life-long. One does not need to possess a great amount of architectural knowledge to be able to appreciate its beauty and grandeur. The clock-tower is 200 feet high, and I believe there are twenty-eight bells in it, played by machinery. The hours, half-hours, &c., are struck by a "Big Ben," and one might imagine himself in the environs of the Houses of Parliament when listening to its strokes.

A reflection of the wealth of the Grosvenor family is apparent in the interior of the hall, in the building itself, and equally so in the less important structures that form part of the establishment. The garden-walls, offices, sheds, &c., are no exceptions. There is no mean work—indeed, there is no inexpensive work to be seen anywhere.

It may be interesting to recall that the Grosvenor family have not yet been associated with Eaton for quite 500 years. It was about 400 years ago that Sir Robert Grosvenor married the heiress to the last male of the ancient family of Eaton.

The view from the south-east front of Eaton Hall is a fascinating one, and fairly extensive. The immediate district is rather flat, but the Peckforton hills, and the pretty ruins of Beeston Castle, belonging to Lord Tollemahe, are features of uncommon interest and beauty. There are numerous fish-ponds, too, that, meandering through the picture, are occasionally visible. The parterre flower-garden is not an ordinary one, with geometrical beds of various shapes, but each half originally described the letter W. A figure representing the design was published in these columns January 7, 1871, p. 14. It has since been modified in a slight degree. My visit to Eaton was made during August, and the beds were then looking very gay and attractive. To the north-east of the hall is what is known as the Dutch-garden, and in spring the many beds will doubtless be ablaze with bulbous flowers. When I saw them, however, they were decorated with *Violas*—and what are more pretty? Looking over the country in this direction are the Flintshire hills and the estate of Hawarden. Many good specimens of *Rhododendron arboreum* were noticed.

There are fine Conifers and ornamental trees and shrubs, deciduous and evergreen, in the pleasure-grounds, and the Golden Yews are particularly effective and good. But my time was unfortunately too brief to permit me to obtain a sufficient knowledge of the many features of this department to attempt to describe them. During a most hurried walk through them with Mr. N. F. Barnes, who for the past six years has had charge of the gardens, the splendid condition of the grass, the walks, flower-beds, and the grounds generally was most obvious.

THE PLANT-HOUSES.

Most of the glass structures are situate in or near to the kitchen garden, which is approached from every side through costly and richly-decorated gates. Of all the houses, I was most struck with the charming effect to be seen in the long corridor (see *Gardeners' Chronicle*, January 2, 1875, p. 17). This structure is about 125 yards long and 10 feet wide, and probably about 18 feet high. It was furnished abundantly with the choicest and sweetest of flowering-plants. From the roof were suspended grace-

fully, long flowering sprays of Bougainvilleas, Honey-suckles, Fuchsias, Tacsonias, Jasmines, Lapagerias, Roses, and numerous other species suitable to the purpose. *Cobæa scandens variegata* was very effective, and several of the Acacias, including *A. dealbata*, would flower later; also *Cassia corymbosa*. Underneath this floral arcade were stood flowering-plants in pots on either side of the stove path. *Daturas*, *Campanula pyramidalis*, and specimens of most of the indoor summer flowering-plants were here used to good purpose. From this corridor, some of the older hothouses at Eaton open at right-angles, and these, instead of being ordinary greenhouses or stoves for the cultivation of plants of miscellaneous species, possess one prevailing feature in each. For instance, one of them is an aquatic-house, in the centre being a large water-tank, where Marliac's hybrid and other *Nymphæas* adorned the surface of the water. The banks of the water-tank are of rock-work, and upon this were disposed groups of variously-coloured varieties of *Achimenes* in such a tasteful manner that it struck me that this house presented a prettier effect than I had previously observed in a hot house of similar dimensions. There are stages for flowering plants around the sides of the house, and particularly noticeable there were finely-flowered plants of *Clerodendron fallax*.

In another house opening off the corridor were collections of the newer Cannas, and of Hydrangeas. Another house was full of Carnations. Mr. Barnes cultivates thousands of this popular plant, including most extensive batches of the Malmaison varieties. The work of layering had been just completed. In the open also is grown an unusually large number of border Carnations, an area probably an acre in extent being devoted to them. A grand batch of plants of the useful *Cœlogyne cristata* was observed in another house, some of the specimens being very large.

Since Mr. Barnes came to Eaton the glass structures have been supplemented with a number of new ones, built of teak-wood. The *Odontoglossum*-house has been built about eighteen months. It is a lean-to, with a north aspect. The shelves are covered with broken spa (white), a material that absorbs considerable moisture, and that presents a bright and clean appearance. The *Odontoglossums* were looking well, and apparently were in capital health, including the fine variety of *Miltonia Pescatorei*, known as *Duchess of Westminster*, which was exhibited before the Orchid committee of the Royal Horticultural Society in the spring of the present year.

The span-roofed *Cypripedium*-house contained a magnificent lot of plants, and the culture of them was the more interesting because a number of seedlings are being raised. The *Cattleya*-house is another span-roofed structure, and adjoins to the *Cypripedium*-house. Another house was filled with *Dendrobium*, the collection being especially rich in the more useful species that produce showy flowers.

From the appearance presented by a houseful of plants of *Calanthes*, of *Veitchi*, *vestita*, and other varieties, I doubt not but these now furnish a magnificent harvest of bloom. There is a fine span-roof house for the display of Orchids in bloom, an Orchid show-house so to speak; it is 80 feet long, and 18 feet wide, and the woodwork is teak. There were not many species in bloom except *Cattleya labiata* at the time of my visit, it being a very poor month for Orchid flowers. But there were some, and over a groundwork of Ferns, *A. Farleyense*, *cuneatum*, &c., the effect was pretty. Particularly deserving of note in this structure, were some suspended baskets containing plants of *Asparagus*. Both in this and the aquatic-house, the baskets of *A. Sprengeri* and *decumbens* were extremely decorative. If the beauty of these *Asparaguses*, when well grown in baskets, were better known, they would surely be more common. The interior of the Orchid-house was illustrated in a supplement to the *Gardeners' Chronicle*, January 18, 1896.

THE FRUIT-HOUSES

were just as remarkable as the other features of the garden. In the orchard-house there were good crops of Plums, Cherries, Peaches, Nectarines, Apples, and Pears, the fruits of most of these being

just upon ripening. There are numerous vineries, and the canes were well cropped. Madresfield Court, Black Hamburg, Muscats, Black Alicante, and Lady Downes' Seedling appeared to be the varieties grown in greatest quantity. There were abundant crops of Peaches, Nectarines, Plums, Melons, Figs, and Tomatos. At Eaton the Figs are given a space commensurate with their value.

OTHER ITEMS.

A feature of the gardens that is particularly gratifying, is the dwelling or bothy that has been provided for the young gardeners. It is a splendid structure, and affords comfortable and convenient lodging to nineteen young men. It would fill the hearts of many a probationer from a less-favoured establishment with pardonable envy. When at Eaton the present Duke of Westminster was described to me as "an all-round man." This much is evident enough. Whatever he does, whether it be an attempt to win the "Derby" or build a humble shed, he will employ best talent and material. His domestic furniture is unexcelled, and he is just as desirous that his garden should be. It is a pleasing circumstance that the generosity of the Duke of Westminster has made Eaton, with all its grandeur, a place open to all comers. Any one may visit the park and gardens upon payment of the nominal sum of 6d. The proceeds are handed over to Chester charities, and they benefit by about £500 a year from this source.

The present gardener came to Eaton from Sandringham, and the condition of his charge is highly creditable to him. He is a young man, and modest to a fault. We occasionally hear it said that there do not appear to be young men forthcoming to take the place of the best gardeners of a decade ago. The best education for such despondents would be an introduction to several of the younger gardeners I could name of the type of Mr. Barnes.

The best possible feeling exists between the head gardener at Eaton and those who, at the same place, are obtaining an important portion of their horticultural training.

Bidding Mr. Barnes good-bye all too soon, we drove through the long park-drive, where we met many pedestrians and cyclists; thence over the beautiful Grosvenor Bridge that spans the Dee, afterwards past the Rhodæ, where the financially unsuccessful horticultural show of 1897 was held, until we were again in the heart of Chester. R. H. P.

CHRYSANTHEMUMS.

THE ANNUAL PROPAGATION.—Except in a few instances of individual plants, the best results (exhibition blooms) are consequent upon early propagation. It is not upon chance incidents that we base our system of culture of any plant, and as the majority of growers obtain most success from early-struck plants, that is a wise course to recommend.

In Scotland especially a long season of growth is provided by the early insertion of cuttings, and as the finest blooms of the Japanese section that I have seen during a tour of the best shows were Scotch grown, it is a wise precaution to start early. A steady, uninterrupted growth is required that the maturity of the wood may be gradual, timely, and consequently perfect. Many cultivators attach so little importance to the question of maturity that no other circumstance is needed to explain their failure at exhibitions.

Chrysanthemum culture is easy, providing the best cuttings are obtainable, and there is suitable convenience to strike them. The first cuttings consist of stout, not too sappy, growths, that spring up, if possible, clear of the stem of last season's plant. Premature bud-formation is less likely to take place than when the cuttings are taken direct from the stem.

Instead of a plant growing away freely until its first natural break is made in April or May, or it is thought necessary to pinch out the point of the plant to produce an early break, it may produce flower-buds at a height of 6 inches or more. When a few inches

more growth has been made the plant may produce another bud, and this may mean failure. The best convenience for striking the cuttings is that afforded by a cool-house or pit from which frost is excluded, the temperature of which by night should be about 40°, with a rise of 10° by day. A frame, handlight, or temporary box, with sheets of glass covering it, placed on the side-stage of such a structure as near to the glass as possible, affords an ideal site. Cover the bottom of the frame with slates, and over these place a layer of fine coal-ashes, which will make it almost air-tight, and a cool base on which the pots containing the cuttings may be placed.

In making the cuttings trim the leaves from the base, and cut square below a joint. Some gardeners remove the buds from all the nodes that are inserted below the surface to prevent the growth of suckers. If this plan was rigidly followed, how should we obtain sufficient cuttings from those varieties that naturally produce few?

With a view to avoid giving any check to the plants when they will be removed into larger pots, each cutting should be struck separately in 2½-inch or "thumb"-pots. The pots, if new, must be well soaked before use, or they will absorb the moisture from the soil to the detriment of the cuttings; and old pots should be cleansed by washing. One crock is sufficient for drainage in each such pot, and over this should be placed a little of the rougher parts of the compost to ensure a free run for water. Firmly fill the pots with a well-mixed compost of equal parts loam and leaf-mould, with a free admixture of sharp silver-sand. Prepare the holes for the cuttings with a bluntly-ending dibble, and make the soil firm at the base of the cutting. Give a gentle watering with a fine rose-can to settle the soil about the cuttings. Keep the atmosphere close until roots have formed, but ventilate the frame for an hour each morning to get rid of excessive moisture. In the evening, by means of a sponge, all condensed moisture should be wiped from the glass. No shading will be needed. E. Molyneux.

CHRYSANTHEMUMS IN SCOTLAND.

Generally speaking, Chrysanthemums have had a bad time of it in Scotland. There has been scarcely any sunshine, but instead, wet, Scotch-mists, and "hairs," which, though not so wetting as mists, are equally disastrous in their effects on expanding and expanded blooms. Flowers have been later and smaller than usual. Where fire-heat has been necessary to combat damp it has hurried the blooms, but the rule has been late flowering. One very successful grower of high-class blooms for market informs me that he has allowed earlier flowers to damp-off in preference to using fire-heat, in order to keep the others as late as possible. The reason in this case is not encouraging: it is, that early blooms are not worth marketing. Prices were equally low in 1897, and this has caused a reduction to be made in the numbers grown by some of the larger growers, in one case the number involved being tens of thousands. During the last ten to fifteen years the flower-trade in Scotland has increased in the most extraordinary manner, and as Chrysanthemums in winter, and Daffodils in spring and summer, are the chief flowers cultivated, the price in some cases is not sufficient to cover carriage. Nor do they pay the legitimate retailer, for grocers and others purchase quantities when they are cheap, and sell them at prices with which the former cannot compete. [Why cannot they?]

Varieties for furnishing blooms for cutting still include a few old varieties. Of the latter Elaine is largely grown, and Mrs. Rundle and Mrs. Dixon in less numbers. William Holmes in good quantity. *Souvenir de Petite Amie* is a general favourite, and is very largely cultivated; it is a useful variety for private gardens, grown in 6 or 7-inch pots, and eight to ten flowers allowed to develop. *Ma Perfection*, an incurved white, is perhaps even better, and not any taller. Another good white which is generally earlier to bloom than these, is *Madame A. Chatin*. Louise is also a charming variety, and bears a few flowers of good quality in small pots, its low growing habit rendering it suitable for use in apartments. The

Vivian Morel varieties have lost favour among market men, and so has Niveum; but the same cannot be said of them in private establishments where alike as pot-plants and as cut flowers, they are exceedingly valuable. La Triomphante, again, is indispensable. It provides large blooms, the first opening here towards the end of October, and if properly managed continues to bloom in succession until nearly Christmas.

A somewhat out-of-the-way thing has occurred in connection with the bronze sport, George Goodson. My stock of this variety was taken wholly from one plant, and of it four plants were grown. One of these has flowered, G. Goodson, another La Triomphante, and the other two have clear yellow-coloured flowers. Comparing my notes with those of a friend, I was surprised to find that the same thing had happened with him. A favourite yellow variety, and one of the most beautiful is Miss Libby Allen. The habit is straggling, and I find it succeeds best when grown in a 6-inch flower-pot, or a two-year-old plant in two sizes larger. Even the smallest blooms incurve, but the plant should be thinned to carry from eight to twelve blooms, and these, if cut with long stems, provide one of the most lovely of all flowers for furnishing large glasses in winter. Mr. Jones' new yellow Japanese R. Hooper Pearson was greatly admired in Edinburgh. The blooms were not large, as shown, but they gave one the idea that this brilliant yellow flower will have a future in gardens. What we do want is a greater number of broad-petalled varieties, suitable to grow as dwarf plants, and floriferous in habit.

Only a few of the "Anemone" varieties are of value; the most useful of all these is undoubtedly Lady Margaret, which, as a rule, we have in fine form at Christmas. Of single varieties, the only one I am able to find room for is Miss Mary Anderson. It is grown in 6-inch pots, and is useful for furnishing, alike as a pot-plant or when cut. R. P. Brotherton.

CHRYSANTHEMUMS AT KING'S BROMLEY MANOR, STAFFS.

I have lately had an opportunity of viewing the large collection of Japanese varieties in the gardens of Mrs. S. A. Lane to the number of about 500. The plants are grown for supplying large blooms, and are arranged in a span-roofed greenhouse and lean-to vinery, in such a manner that most of the flowers could be seen. They formed a fine sight, nearly every bloom fully up to exhibition size. The following were among Mr. Warr's successes, Australia, large and deep; Chas. Blick, C. W. Richardson, Eda Prass, fine; Elith Tabor, Edwin Molyneux, Etoile de Lyon, very large; Eva Knowles, Geo. Goodson, Graphic, fine; International, large; John Seward, Joseph Chamberlain, Lord Brooke, Madame Carnot, large, and other modern varieties of the Japanese class. Incurved and large Anemone varieties were equally good with the Japanese; Duchess of Fife and Ma Perfection being unusually fine blooms. J. C.

THE VARIETY MADAME CARNOT.

In a short note upon new white Chrysanthemums, I incidentally mentioned that Calvat's Madame Carnot was probably the finest Japanese Chrysanthemum in the world, and to this remark the editor added that it has recently been dethroned by the National Horticultural Society of France. But I may, perhaps, be allowed to say that this is not the fact, if it is understood that I was referring to the variety as an exhibition flower.

As I have taken part in the elections of the Paris Chrysanthemum Committee, I may say that as a show flower Madame Carnot has not been dethroned, and still remains in the group of the best hundred varieties for the purpose of big bloom cultivation. In the group of fifty varieties for dwarf bushy plants, Madame Carnot has, however, been displaced, but that in no way affects her position as a first-class exhibition variety in a cut state. The life of a popular show Chrysanthemum is often of brief duration, and Madame Carnot may follow many another old-time favourite, and disappear, but it needs no prophet to say that it will be a long time first. [We dare not call in question the statement of our valued contributor. We can only say that we quoted

from the *Journal de la Société Nationale d'Horticulture de France* for September last. At p. 899, lists are given of new varieties to be included in the groupements in place of "variétés anciennes inférieures." Among the *variétés remplacées* in the third "groupement" is Madame Carnot. ED.]

CHRYSANTHEMUMS IN ITALY.

Mr. Briscoe-Ironside, a well-known English amateur, resident in Italy, writes that a really marvellous progress and enthusiasm have been displayed this year by the Italians in Chrysanthemum cultivation. There have been three shows, viz., at Turin, Pallanza, and Milan. At the first-named show, the Turin growers were specially noteworthy for their grand display of plants, most of them being no higher than 2 feet. Milan exhibition (see also p. 406) was stronger in cut blooms, and the show was held in the Gallery of Fine Arts, a building well lighted and more suitable for the purpose.

This show was held under the auspices of the new Italian N.C.S., and it is a curious fact that the only two First-class Certificates awarded by the Floral Committee, were to seedlings by the eminent French raiser Ernest Calvat.

Mr. Briscoe-Ironside was awarded a Gold Medal at Turin, also a Silver Medal and Grand Diploma of Honour for a group of plants, 12 yards long by 6 yards in width, which he set up at the Pallanza show. He was also successful at the Milan gathering, where he was awarded a Gold Medal. Other exhibitors were Mr. Scalarandis, Messrs. Radaelli, Mr. Brocchi, and Molin.

Those friends of Mr. Briscoe-Ironside who remember his earnest enthusiasm in all matters relating to the autumn queen, will not be surprised to hear that some of it has been imparted to his Italian neighbours, and will congratulate him on his successes. C. H. P.

POPULAR SHOW CHRYSANTHEMUMS.

Looking over the records of our leading shows, one cannot help noticing how very largely exhibitors rely upon the same flowers all over the country for their most successful boards. The following names, tabulated from the first-prize collections in the principal classes at our best shows of the season, are given as an indication of what may be regarded as the most popular varieties with the big prize-winners from one end of the kingdom to the other, viz., Madame Carnot, Australia, Madame Gustave Henry, Phœbus, M. Chenon de Leché, Mrs. G. W. Palmer, Edith Tabor, Mrs. J. Lewis, Edwin Molyneux, Mrs. C. Harman-Payne, Simplicity, Lady Hanham, Pride of Madford, Vivian Morel, Mrs. H. Weeks, Oceana, G. J. Warren, Elia Curtis, John Seward, M. Pankoucke, Chas. Davis, Pride of Exmouth, Lady Ridgway, Mme. G. Bruant, G. C. Schwabe, Graphic, Mrs. W. Mease, Robt. Powell, Eva Knowles, J. Bidencope, Secrétaire Fierens, Dorothy Seward, Lady Byron, Mary Molyneux, N. C. S. Jubilee, Madame Marius Ricoud, M. Hoste, Elthorne Beauty, Thomas Wilkins, &c.

Some growers may be surprised to learn that only once was Sunflower shown in these collections, and that other varieties such as Mdle. Thérèse Rey, C. B. Haywood, Madame Ph. Rivoire, Mdle. M. A. de Galbert, Mrs. C. Blick, and Duke of York were only shown twice. C. H. P.

COLONIAL NOVELTIES.

No one who has been interested in the Chrysanthemum for any length of time can have failed to notice the numerous and decisive helps along the road to popularity that the wonderful Oriental flower has received at various times. And varied as these have been during the past twenty years or more, there seems to me to be an indication of another new departure of no little importance, i.e., the raising of new seedlings in the colonies. A few of the best, such as Australia, Oceana, Pride of Madford, are well known, and are in general cultivation in this country; but the present season has witnessed an influx of novelties from colonial sources that promises to rival in number and quality the steady importation from the continent.

At the trade-displays and floral meetings there have been this season far more Chrysanthemums of

colonial origin than ever before, and many of them are flowers of the highest promise. Indeed, there are some that, in the opinion of the exhibitor, must take rank with anything produced by the older and more experienced growers of American and European fame, the finest example being, perhaps, Mr. T. Carrington, a big, massive Japanese incurved, with very broad florets, colour deep rosy-purple, with a silvery-pink reverse, the florets being long, pointed, and of good width. Miss Nellie Pockett is another—a Japanese with long, narrow florets, grooved, pointed, and incurving; a close, compact flower, of large size colour pure waxy-white. Then Chatsworth also belongs to the back row blooms; this is a Japanese, with long, drooping florets, colour white, shaded pinkish-purple. A rather fine Japanese incurved is to be found in John Pockett, which has broad florets, and the colour a rich shade of deep golden chestnut-bronze, and a golden reverse. Purple Emperor is not so large as those already mentioned, but its form and colour are really fine. It is a Japanese of good build, very full and double, and the colour a rich velvety shade of plum-coloured purple, reverse silvery.

In new yellows, Miss Mary Underhay is at once striking and good. The florets are of medium size, and are grooved and incurving, the colour a very pure pale yellow, and in the same shade Mrs. Ernest Carter, of the long petalled Japanese type, also deserves to be mentioned. Others, such as Mrs. H. Briscoe, rosy mauve, with silvery reverse; Beauty of Adelaide, dull rosy-pink Japanese, with very long florets; Wonderful, crimson and gold; Mrs. Bissett, white; G. Kerslake, Junr., white; Miss Vera May Fraser, terra cotta; The Convention, terra cotta; Mrs. E. H. Haines, golden bronze; Euterpe, rosy-mauve; and several more will, no doubt, be heard of again.

If our colonial friends are likely to produce such a collection as these every year, they are certainly destined to become very formidable rivals to the raisers upon whom we have hitherto depended for our novelties. C. Harman Payne.

Obituary.

PROFESSOR ALLMAN. — Naturalists the world over will regret the loss of this distinguished zoologist, who held successively the chairs of Natural History in Dublin and in Edinburgh. On the resignation of Mr. Bentham, Allman became President of the Linnean Society, where his great knowledge and genial manners endeared him to the Fellows. Although Dr. Allman's original work was mainly of a zoological nature, he had a good botanical knowledge, and his garden at Parkstone, near Poole, was so filled with rare and interesting plants as to be a source of great delight to visitors. Dr. Allman had for many years been an occasional correspondent of this journal. He died at Parkstone on the 24th ult., in the eighty-seventh year of his age.

SOCIETIES.

NORFOLK AND NORWICH HORTICULTURAL.

NOVEMBER 17.—A remarkably good exhibition was seen in St. Andrew's Hall on this occasion, and a canvas annexe erected by the side of the Hall was full of excellent vegetables.

In the Blackfriars Hall was arranged the fruit on both sides, while down the centre Messrs. GEO. BUNYARD & Co. staged an extensive and splendid collection of Apples and Pears. Mr. GAYMER, of cider fame, had a large pyramid of Cider Apples, and sample bottles of what is made from them; while at the far end Messrs. DANIEL BROS. had a large and attractive collection of plants, flowers, fruits, and vegetables, of great interest.

The judging commenced somewhat late—too late, in fact, and as it is the practice to admit visitors at noon the judges are somewhat hampered in their work, and anything in the way of note-taking becomes very difficult; therefore, only a few salient points of the show can be touched upon. We may say of the plants that they were mainly bush specimens, generally well grown, and carrying good heads of bloom. They were ranged along one side of the hall in a good light, and were a leading feature. Other plants were shown, Orchids, Cyclamens, &c.

CHRYSANTHEMUMS—CUT BLOOMS.

The leading feature at Norwich is the cut blooms, and it may be said of the Norwich show this season, that every entry was staged. The collection of Japanese varieties was a fine feature, Mr. F. Hanson, gr. to Sir S. Crossley, Bart., taking the 1st prize with fine blooms, many of them the latest novelties; Mr. R. C. NOTCUTT, nurseryman, Ipswich, was 2nd, and among his capital blooms was a remarkably fine one of Mrs. W. Mease, which was selected as the best Japanese in the show.

The best thirty-six varieties were staged by Mr. Sheddick, gr. to Mr. A. E. FELLOWES; this lot consisted of eighteen Japanese and eighteen incurved, the latter strong, being fresh, even, and well balanced. Mr. E. S. TRAFFORD was 2nd, with very good Japanese, but the incurveds fell below Mr. Sheddick's in size and finish.

In the class for twenty-four Japanese, Mr. W. Allan, gr. to Lord Suffield, Gunton Park, Norwich, was 1st, with some very fine blooms, and so good was the average that this stand was awarded, in addition, the Certificate of the National Chrysanthemum Society. Mr. W. HAPTHORPE, Cambridge, was a good 2nd.

Mr. C. E. GOOCH had the best twelve of Japanese, all of fine substance; and Mr. E. F. BRITTON was 2nd, G. J. Warren and E. Molyneux being particularly good.

The class for twelve varieties of Japanese brought a good competition, though the wording of it needs some revision, as one exhibitor brought only twelve blooms in four varieties; Mr. ALLAN was 1st, Sunstone being shown in fine character. The name of the 2nd prize-winner was not stated. There was a keen competition with six blooms of Japanese, Mr. J. A. KENDREW was 1st with a capital half dozen, Mrs. G. W. Palmer being finely finished; Mr. THOS. CHAPLIN was 2nd. The best six blooms of one variety were furnished by Madame Carnot, well shown by all the prize-winners; Mr. B. FLETCHER was 1st, and Mr. F. RANDALL 2nd. The best six Japanese any colour but white, were Edith Tabor, from Mr. G. E. GOOCH; Mr. W. ALLAN came 2nd with fine blooms of M. Chenon de Leché, somewhat uneven in colour.

Some very good incurved blooms were shown, Mr. HANSON being again to the fore with twenty-four blooms, such varieties as J. Agate, Mme. Ferlat, C. H. Curtis, Lady Isabel, Bonnie Dundee, and others, were finely developed. Mr. E. S. TRAFFORD was 2nd; it contained a finely-finished bloom of Ma Perfection, which bids fair to become a very popular white incurved.

Mr. E. F. BUXTON was 1st with twelve very fine incurved, so even and well finished that the Certificate of the National Chrysanthemum Society was awarded to it as the best stand of incurved varieties in the show; Mr. B. E. FLETCHER came in a good 2nd.

Mr. T. RANDALL had the best six blooms of any one variety, staging C. H. Curtis in fine character; Mr. BIRBECK was 2nd with Duchess of Fife.

There were classes for amateurs, in which both Jap nese and incurved were creditably shown. The reflexed, pom-pom, and Anemone types appear to be declining features at Norwich, as elsewhere, the ponderous Japanese dominate with cultivators to such a great extent. What few of the foregoing types were staged were generally good.

FRUIT AND VEGETABLES.

In regard to fruit, Mr. B. E. FLETCHER had the best collection of six varieties, and among the principal prize-winners with Grapes were Mr. ALLAN, Mr. C. H. WATTS, and Mrs. FISON. Apples, Pears, and other fruits were in good character.

All types of vegetables were shown pretty well, and many in very fine character. It was noticeable that Sea-kale was prominent in most of them. The collection of eight varieties which won for Mr. G. Davidson, gr. to Mr. PETRE the 1st prize was remarkably good.

The special prizes offered by Messrs. Daniels Bros., Messrs. Sutton & Sons, Messrs. Carter & Co., and others, all brought good competition. There appeared to be a remarkable absence of coloured varieties among the Potatoes; perhaps the judges discount their value because coloured.

MISCELLANEOUS.

In the way of miscellaneous exhibits, Mr. J. GREEN, Norfolk Nurseries, Dereham, had two large tables of Chrysanthemums of every class, of excellent quality, and a Certificate of Merit was awarded to him for a decorative variety named Black Hawk. The same award was made to Mr. R. HOLMES for decorative Chrysanthemum Lizzie Adcock, a clear golden form of Source d'Or. The NORFOLK AND NORWICH HORTICULTURAL SOCIETY had an interesting miscellaneous exhibit. Mr. A. J. DAWDY, Norwich, had elaborate wreaths, bouquets, sprays, &c.; and Mr. F. ALDIS, Norwich, the same, only on a larger scale, and a very attractive feature the stand was. The weather was favourable, and the attendance very large. Special awards were made to all the miscellaneous collections.

We understand this is the last year of Mr. E. H. Pollard's management as secretary, which will be a matter for regret with many exhibitors.

WOKINGHAM AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 22.—A very attractive exhibition, of small dimensions, was provided in the Drill Hall on this occasion, and the day being a bright one the various exhibits were seen to the best advantage. Some bright groups found a

place round the sides of the hall, while the fruit and cut-flowers were on centre tables.

The 1st prize for a group of Chrysanthemums and foliage plants was won by Mr. J. Cowie, gr. to Sir T. LUCAS, Bart., who expressed excellent taste in his arrangement; Mr. W. P. Bound, gr. to Mrs. LEVESON GOWER, was 2nd.

Mr. W. J. Jones, gr. to Sir R. WILMOT, Bart., was 1st with a group of Chrysanthemums bearing specimen flowers. The groups of plants not disbudded made the best display, because, bearing a large number of blossoms, they formed attractive batches of colour. Mr. C. Moles, gr. to W. H. PALMER, Esq., the president of the society, was a good 1st; and Mr. R. Chamberlain, gr. to F. N. LONERGAN, Esq., 2nd. Mr. MOLES also had the best group of flowering and foliaged plants nicely arranged, having Chrysanthemums, Marguerites, zonal Pelargoniums, &c. Mr. G. Lane, gr. to Miss RIDGES, Englefield, was 2nd also with a nicely arranged exhibit. There were also small collections of foliaged and flowering plants, classes for Primulas and Ferns shown in threes, all of which helped the display.

Some very good cut flowers of incurved Chrysanthemums were staged. Mr. G. LANE staged an excellent dozen, chief among them Mille. L. Faure, Dorothy Foster, Ma Perfection, C. H. Curtis, Violet Foster, Bonnie Dundee, and Empress of India. Mr. R. Bassil, gr. to D. H. EVANS, Esq., Pangbourne, was 2nd, also with fine blooms. Mr. G. LANE had the best six of one variety, staging good C. H. Curtis.

In the class for twelve Japanese blooms, Mr. R. BASSIL came in 1st, having well-developed blooms, chief among them Lady Hanham, Charles Davis, Edith Tabor, Australie, Ella Curtis, Mrs. Maling Grant, Nellie Pockett, &c. Mr. G. LANE was 2nd; his leading flowers were Madame Carnot, Jalerie, Graphic, Madame Ricoud, and Joseph Brooks. Mr. R. BASSIL also had the best six blooms of one variety of Japanese, staging well-developed Australie; Mr. Lane was 2nd, with Desdemona. In the amateurs' division, good blooms were staged.

The best table group of Chrysanthemums, arranged with foliaged plants, came from Mr. E. Paine, gr. to the Rev. A. G. CAMPBELL, Bracknell; and Mr. R. CHAMBERLAIN was 2nd.

Fruit—Some good fruit was shown. Mr. CHAMBERLAIN had the best three bunches of black Grapes, staging well-finished Alicante; and Mr. Howell, gr. to G. E. KRUGERS, Esq., was 1st with white Muscats. Mr. CHAMBERLAIN was 1st with four dishes of excellent dessert Apples, having fine fruit of Blenheim, King, Cox's Orange and Ribston Pippins; Mr. W. P. BOUND was a good 2nd with smaller, but very pretty fruit. Mr. BOUND was 1st with four dishes of culinary Apples, having a very good collection, consisting of St. John's, Alfriston, Peasgood's Nonsuch, and Mere de Menage; Mr. G. LANGRIDGE was a good 2nd. Mr. CHAMBERLAIN was also 1st with four dishes of Pears, having capital examples of Pitmaston Duchess, Beurré Clairgeau, Doyenné du Comice, and Beurré Sterckmans; Mr. LANGRIDGE was 2nd.

Apples in single dishes were shown by several amateurs. There were some table decorations, and also bouquets formed of Chrysanthemums, that were very pretty and bright.

Vegetables were fairly numerous, and of good quality, especially those competing for the special prizes offered by Messrs. SUTTON & SONS.

ABERDEEN CHRYSANTHEMUM.

NOVEMBER 23, 24.—The third annual show, promoted by this Society, was held in the Music Hall Buildings, Aberdeen, on the above dates.

Year by year the entries have increased, and on this occasion they numbered no fewer than 460. These included Chrysanthemums, Orchids, and other pot plants, besides fruit and vegetables. In 1895, the first show of the Society, the total numbers were 251, in 1897 it rose to 397. In point of quality, too, the show was excellent, the display surpassing anything previously seen in Aberdeen. The show was opened by the Lord Provost of the city.

In the open group class, Mr. G. STEPHEN, gr., Cupar, stone Lodge, was 1st, with an array of well-bloomed plants, tastefully arranged; his chief varieties were Tynemouth, Vivian Morel, and Phoebe; and Mr. William Proctor, gr. to Sir WILLIAM HENDERSON, Devanha House, was 2nd, with a scarcely inferior display.

Coming to the cut flowers, the feature of the show was the exhibit of Mr. J. GRANT, Crimonmogate, in the class of twenty-four Japanese Chrysanthemums. The finest flowers were Simplicity, Australie, Edith Tabor, Mrs. C. H. Payne, Mutual Friend, Phoebe, Oceana, Pride of Madford, E. Molyneux, Australian Gold, and Modesto, the last-named being magnificent. Mr. G. Ogg, Morken, was 2nd, with some lovely blooms, but lacking the grace and finish of the 1st prize collection. Other principal prize winners in the section for all-comers were Mr. J. PRIME, gr., Strichen; Mr. FRASER, gr., Crathes Castle; Mr. ALEXANDER ROBB, gr., Glenburnie Park; Mr. REID, gr., Durriss; Mr. GRIGOR, gr., Fairfield; and Mr. KENNEDY, gr., Brucklay Castle.

The following are the principal special prizes and the winners:—(Open), three Chrysanthemums, pots not exceeding 11 inches in diameter, 1st prize, Gold Medal, Mr. WILLIAM PROCTOR, Devanha House; six Chrysanthemums, at least four varieties, pots not to exceed 6 inches, one bloom to each plant, Mr. W. Ogg, Morken; twelve Japanese Chrysanthemums, at least six varieties, all named, Mr. J. PRIME, Strichen; twelve incurveds, at least six varieties, all named, 1st prize, Gold Medal, Mr. GRANT, Crimonmogate; six bunches, single flowered, in at least four varieties, 1st prize,

Silver Medal, Mr. GRIGOR, Fairfield; one hand-bouquet, Chrysanthemums, any kind of foliage, Gold Medal, Mr. ROBB, Glenburnie Park; one lady's spray, any kind of foliage, Silver Medal, J. H. FIFE, Thistle Place, Aberdeen.

In the amateur classes, Gold Medals were won by Mr. COURTIS, Hardgate, Aberdeen, and Mr. TOUGH, Bon Accord Street; Mr. COURTIS also carried off a Silver Medal for best six blooms.

There were one or two additions to the show in the shape of exhibition displays. Messrs. DOBBIE & Co., Rothesay, had a very fine display of Chrysanthemums, including four dozen varieties, mostly new, prominent amongst these was a beautiful green French variety (Madame E. Roger), and the collection was backed by two dozen bunches of decorative kinds. Messrs. WILLIAM SMITH & SONS, Burnside Nurseries, Aberdeen, had also a very pretty and attractive collection, which was much admired.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 24.—At the last meeting at the Coal Exchange, Manchester, there were present Messrs. G. SHORLAND BALL (in the Chair), Warburton, Bolton, Weathers, Backhouse, Cypher, Johnson, and Mills (Hon. Sec.).

The following is a list of the awards made, viz.:—G. W. LAW-SHOFFIELD, Esq., Rawtenstall (gr., Mr. Schill), showed Cypripedium Warneri-Bello, Award of Merit. S. GRATRICK, Esq., Whalley Range (gr., Mr. McLeod), showed Cypripedium insigne Baron Schroder, First-class Certificate; C. insigne, Award of Merit; C. Charlesworthi, Award of Merit; C. insigne giganteum, and C. insigne, a yellow variety. G. SHORLAND BALL, Esq., Wilmslow (gr., Mr. Gibbons), showed Lycaste Ballie (Skinneri and Mesuresiana), First-class Certificate; Lycaste Skinneri Ashfordi, Award of Merit; Odontoglossum insigne splendens, "Ashford var.," First-class Certificate; O. Orstedii majus, Award of Merit; Cypripedium memoria Moensii, First-class Certificate; C. tonsum magnificum, Award of Merit; C. Lecanum magnificum, C. L. giganteum, and C. Arthurianum pulchellum. THOMAS STATTER, Esq., Whitefield (gr., Mr. Johnson), showed Cypripedium Albertianum expansum, Award of Merit; C. insigne Johnsonianum, First-class Certificate; and Cattleya Hardiana Massiana, First-class Certificate. JOHN LEEMAN, Esq., Hutton Mersey (gr., Mr. Edge), showed Cattleya Victoria Regina, First-class Certificate; C. labiata, Award of Merit; Lælio-Cattleya Gotoiana, Odonto. crispum, and Cypripedium J. B. Haywood. WM. BOLTON, Esq., Warrington (gr., Mr. Cain), showed Oncidium Rogersii giganteum, Award of Merit, and Oncidium Rogersii. Messrs. F. SANDER & Co., St. Albans, showed Cypripedium Lecanum princeps, C. nitens, C. Lecanum, C. Theodore Buller, C. John Carder (selligerum majus x thursissimum), Award of Merit; Phaius Ashworthianus, and two forms of Lælio-Cattleya (amethystina x cinnabarina), one of which obtained an Award of Merit.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 20.—A largely-attended meeting of the Society's Executive Committee was held at 265, Strand, on the above date. Mr. T. W. SANDERS in the chair. Reports were received from the Arbitration Committee in respect of protests against the decision of the judges at the November show, and from the Investigation of Sites Sub-Committee, who stated, amongst other things, that the Directors of the Royal Aquarium had agreed to contribute an additional £75 to the prize-list at the November show in 1899.

An interim financial statement was made by the Secretary, and from it we learned that the amount of prize-money awarded at the November show was £330 19s. 6d. It was resolved that the meetings of the Executive Committee should in the coming year take place on August 28, September 25, October 23, November 27, December 18, and January 16, 1900. It was agreed there should be eight meetings of the Floral Committee in 1899, the days and time of meeting to be determined by the Floral Committee. Letters were read from Mr. Henry Deverill, seedsman, Banbury; and from Mr. R. Sydenham, Birmingham, offering special prizes for vegetables, &c., in 1899. These were accepted. An offer from Messrs. Ray & Co. of special prizes for a new variety of Chrysanthemum, was referred to the Schedule Revision Sub-committee. Attention was called to a catalogue of Chrysanthemums, recently issued by Mr. W. Wells, Earlswood, Redhill, which it was asserted contained statements which could not be justified, and which cast serious reflections upon the honour of the National Chrysanthemum Society. After a discussion, in which Mr. Wells took part, he promised not to attempt to distribute his catalogues at the coming December show, and also undertook to withdraw all imputations affecting the National Chrysanthemum Society, and also against the individuals to whom personal reference was made. Fifteen new members were elected.

THE ANNUAL DINNER.

NOVEMBER 30.—A very successful event was the annual dinner of the Society, held in the Crown Room of the Holborn Restaurant on the above date. The unusual *clat* that characterised the proceedings was no doubt mainly due to three causes:—

1. The Committee has at last decided to hold its festive function at a more convenient place than heretofore. 2. The

excellent sides of Sir A. K. Rollit, Knt., M.P., as chairman, and (4). The general good humour of the large company that was present.

For the first time in the history of the Society also, on this occasion, a special invitation had been extended to members of the gentler sex, and this was responded to by the presence of perhaps a score of ladies, a very small proportion of the company, which was, as a whole, quite sufficient for the capacity of the room.

The tables were nicely decorated with Chrysanthemum flowers, and the faces of many members of the company were only partly visible behind the monstrous blooms of G. J. Warren and other flowers that they carried in their buttonholes. The two curious varieties we figure this week were also much in evidence, and were passed around and discussed as novelties, the Chairman remarking that he intended to take home a specimen of each.

Sir A. K. Rollit, who arrived somewhat late, owing to pressure of other engagements, in proposing the Royal Toast, after seeking to connect flowers with Royalty as early as the Plantagenets, said he was glad to be able to remove an erroneous impression that he believed to exist. The Chrysanthemum was indigenous to India. It was fashionable to attribute everything, the mariner's compass included, as having existed previously in China. The Chrysanthemum, however, was a British subject.

Then the toast of "The donors of special prizes," was proposed by Mr. P. Waterer, who incidentally remarked upon the necessity of encouraging newer and more artistic methods of staging the blooms, suggesting a class for twelve vases, five blooms, with stems, in a vase. Mr. Waterer, after another inevitable thrust at the "rust" fungus, offered a prize of £5 for the best Essay upon the subject. The respondents were Mr. J. W. Wilkinson and Mr. H. J. Jones. Mr. Wilkinson said it was a very great pleasure to the Royal Aquarium Company that the class for twenty-four Japanese blooms, in which the Company offered special prizes, was the most popular class at the November Show. Mr. H. J. Jones' response was a record one. His announcement that he would be happy to offer a 1st prize of £25 for a "Vase" class, as suggested by Mr. Waterer, was received by tumultuous and continued cheering. Mr. Jones hoped others of the trade would come forward with 2nd and 3rd prizes.

The Chairman then proceeded with the presentation of the special prizes, consisting of Plate, Medals, &c. The National Challenge Trophy was presented to Mr. Perry, who accepted it on behalf of the Portsmouth Society. Replying to some appropriate remarks from the chairman, Mr. Perry said Portsmouth was always in a fighting mood, and the company might depend upon Portsmouth in the event of entering a conflict doing her best to become victor. The Holm & Memorial Cups were afterwards presented to Mr. W. H. Lees, Trent Park Gardens, Barnet, and to Mr. W. Higga, Fetcham Park Gardens, Leatherhead. The Turner Memorial Cup has now become the absolute property of Mr. Norman Davis, Framfield. The Gold Medal of the Society was presented to Mr. H. J. Jones, and various medals to Messrs. B. S. Williams & Son, C. E. Wilkins, J. Peed & Sons, Aldridge, Barras, &c. Mr. J. T. Simpson, who showed the premier bloom at the last exhibition—one of G. J. Warren—was presented with a painting of the flower.

The toast of the officers of the Society was proposed by Mr. E. Harland, Hull. He said the affiliated societies looked to the mother Society to lead the van. In the question of grouping, he thought there was not the improvement evident at the N.C.S. exhibitions that they could wish, and he believed this was due to the wording of the schedule.

Mr. C. H. Payne, and Mr. A. E. Stubbs (auditor), replied. After enumerating many nationalities represented in the membership of the Society, Mr. Payne said that the only person they claimed in Germany was an Englishman resident there. Mr. Stubbs had something to say about the reserve fund, and evidently feels that this should be increased rather than diminished.

Sir A. K. Rollit made an excellent speech in proposing the toast of the evening, "The National Chrysanthemum Society." He opened the first Chrysanthemum show held in Hull. He felt it to be a public duty as well as a pleasure to accept the invitation to be present that evening. He pointed out certain political lessons that could be learned in the garden, especially that of "continuity of policy." Happily, some were proud of the profession. When in Ireland recently, he asked a man, "Are you a Home ruler?" "Good —," replied he, "no, I am a gardener." Speaking to the refining and educational influence of gardening, combined with a study of botany, the chairman was evidently in favour of the claims of the physiological as against the systematic branch of that study. "The Chrysanthemum," said Sir A. K. Rollit, "so easily propagated, as easily cultivated, and, blooming in November, is one of the most valuable flowers in the category of plants. The National Chrysanthemum Society was an excellent national institution, 'may it flourish for ever, root and branch.'"

After a humorous speech, in which the Chairman toasted the ladies present, "The Press" was proposed by Mr. R. Fife, and responded to by Mr. Geo. Gordon. "The Chairman" was proposed by Mr. T. W. Sanders.

NOTICES TO CORRESPONDENTS.

APPLES: *G. Woolgar*. Probably, our fruit-naming authority did not recognise No. 4, hence its omission from the list we gave in our issue for November 5.

APRICOTS FOR GROWING UNDER GLASS: *G. C.* Any

variety; but very little forcing must be attempted. Moorpark, Early Moorpark, Shipley, Hemskirk, New Large Early (Rivers), and Oullin's Early Peach, are excellent varieties.

BOOKS: *Pine-apple*. We know of no work dealing solely with the cultivation of stove plants.

BOTANICAL: *S. P.* The Snowdrop and the Daffodil are generally placed in Amaryllidaceæ, but some botanists do not consider Amaryllidaceæ as distinct from Liliaceæ. We recommend you, however, to keep the two orders distinct. In the same way some authors consider Pomaceæ to form a separate order, whilst most include it with Rosacæ.

CALANTHE: *J. C.* The bulb seems to indicate that it had not been sufficiently quickly grown, and that in its latter stage it had been subjected to too much water, and too moist an atmosphere, in place of being ripened off in a tolerably dry warm-house.

CHRYSANTHEMUM: *T. S., Roundwood*. The bloom appears to be nothing more than Colonel W. B. Smith. This variety does not always come so good in colour, especially earlier in the season.

CHRYSANTHEMUMS: *Single W. Crimson sport of Madame Carnot?* No, unfortunately there is none of that tint. We know nothing of the sport of Lady E. Clarke. Enquire of some specialist.

DAMPING OF VIOLETS IN FRAMES: *J. G.* This is not infrequently due to local causes, and then it is more difficult to guard against. It will be better if we tell you when damping does not occur, or not to any great extent: When the bed is made on an elevated spot, and in the front of a south wall as a fruit-wall or dwelling; when the foundations of the bed do not consist of stable-dung, either warm or cold, or of leaves partly or wholly decayed; when the soil in which the plants are planted consists of not more than a quarter leaf-mould; when they are not too deeply planted; when the surface of the bed is not more than 9 inches from the glass; when water is not applied in excess of the needs of the plants, and when it is not applied in cloudy or moist weather; when the plants do not touch each other when planted; when air is not given at the sides or backs of the lights soon after the sun has touched the glass, and continued in mild weather till covering-up time; when night air, in small quantity, is not allowed in mild weather; and finally, when no heated linings are used to keep frost out of the frames. As correctives that can be applied now, there are the removal of warm linings, and the substitution of dry stable litter or fern; the sloping of the soil away from the sides of the frames; affording plenty of ventilation preferably at the sides of the lights, and on the opposite side to the direction of the wind, not forgetting night ventilation, if it be only a 4-inch opening at the back of each light; keeping flower-pots filled with quicklime in the frames, removing these when it is slaked and no longer absorbent; and applying powdered charcoal and silver sand to the depth of 1/4 inch over the surface. Dusting the plants with flowers-of-sulphur would kill the fungus—the cause or result of the damping.

DRIED LEAVES: *A. McD.* We cannot tell what they are. They may be the leaves of some terrestrial Aroid. Perhaps they will spring up next year, when, if you send us a fresh leaf, we will guess again.

ERICA HYEMALIS: *W. B.* We think as you do, that something injurious has been afforded at the root, perhaps too strong a dose of artificial manure. There is no mildew or other fungus present.

EXAMINATION IN HORTICULTURE: *A. S.* In the first place, you should obtain from the Secretary of the Royal Horticultural Society a syllabus; you would then learn what subjects you would require to become proficient in. Having done so, use must be made of the means of instruction existing in neighbouring towns, in the form of polytechnics, mechanics' institutes, public libraries, botanic gardens, and by correspondence classes and home study, to perfect your horticultural education. Manchester, Sheffield, Rochdale, Stockport, Chester, are rich in means of instruction.

GARDENERS' FRIENDLY SOCIETY: *L. P. G.* Assuming that you mean the United Horticultural Benefit and Provident Association, the proper person to afford information is Mr. W. Collins, 9, Mutin-dale Road, Balham, London, S.W.

HOUSES AND PLANTING: *J. W. R.* The houses and lines of crops as per sketch sent run south by west. This would be of lesser importance as regards the lines of crops, but we think it a disadvantage to span-roofed glasshouses, which should rather run in the direction of south-north, so that

the amount of sunshine striking the two sides is about equal in duration.

INSECTS IN ORCHID MOSS: *Alpha*. The insects are Springtails (Poduridae). They are often very abundant in dead leaves and in wet places. They are not likely to be injurious; but if troublesome, their habit of jumping might be taken advantage of, and some tar or other sticky substance put in their way to catch them.

MACLURA AURANTIACA: *H. J. R., Firenze*. The fruit is scarcely eatable; it is of a fine golden-yellow when ripe. The species is a native of the southern United States, and the climate of northern Italy should be sufficiently warm to enable the fruit to ripen in the warmer situations, say, against south or west walls, or rocks.

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.

—*J. H. H.* 1, Rosemary Russet; 2, Golden Noble; 3, London Pippin; 4, Fearn's Pippin; 5, May be a small Cox's Pomona; 6, Round Winter Non-such.—*William von Schroder*. Pear appears to be Beurré Diel, much decayed.—*W. C.* 1, Beauty of Kent; 2, Worcester Pearmain; 3, Queen Caroline; 4, Not known.—*M. R. S.* Apples: 1, Minchull Crab; 2, Not recognised; Pear decayed.—*J. M.* Apple: Beauty of Kent.—*A. W. Holmes*. Keswick Codlin, or near ally.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number. — *A. Bartlett*. *Oncidium micropogon*.

ONCIDIUM LINDENI: *Veritas*. If you refer to *Odonoglossum Lindeni*, a large-bulbed, yellow-flowered species, it is not very free-flowering. When it flowers, it is generally in late summer and autumn. It requires to be kept in the cool-house for the greater part of the year; but when actively growing, the Cattleya-house is not too warm for it.

ONCIDIUM SPILOPTERUM (SAINTLEGERIANUM), &c.: *Veritas*. It usually blooms in late summer and autumn. It is a cool-house plant. The *Selenipedium* of the group to which you refer, viz., *S. Dominicanum*, *S. longifolium* Roezli, &c., are among the easiest to cultivate. They grow best in a compost in which there is a good proportion of loam-fibre. They should be wintered at the cool end of the intermediate-house, and freely watered all the year. In summer they should be carefully shaded.

PEACH LEAVES FUNGUS: *A. P.* The fungus is *Puccinia Pruni*, Pers., very distinct, structurally, from the *Chrysanthemum-rust*, although the two fungi superficially resemble each other. These fungi cannot pass from one species of plant to another.

PLANT IN CENTRE OF LAST SUPPLEMENTARY ILLUSTRATION: *L. V. D. K.* *Aralia Sieboldii*.

PLANTING RICHARDIA IN A POND: *Arum Lily*. Planted in pots sunk in the pond at 18 inches from the surface, they will survive all but our severest winters; but planted at the sides, or in shallow water near the latter, there is always the risk that they will be killed by cold. You must plant when the plant has made a considerable amount of growth, that is, the leaves should range above the water.

VINES FAILING TO MAKE GOOD GROWTH: *Gardener*. There must be something amiss with the soil, or chemical manures in too strong doses have been applied, or heavy applications of soot to the soil to account for this stunting of growth, and loss of the tips of the roots. Up to a recent date the vines made fair progress, that is, till the roots reached a certain distance from the stem. It should not be difficult to discover what this cause is, and less so if all the vine-roots are affected at about the same distance. Have you employed turf that is infested with weevil-grubs or wireworms? Turning it up would reveal them if present.

COMMUNICATIONS RECEIVED.—*C. H. P.*—*S. P.*—*W. E. G.*—*W. T. T.*—*E. A.*, Paris.—*W. R.* & Co.—*Sander & Co.*—*J. C.*—*W. C.*—*A. H.*—*H. R.*—*S. J.*—*G. Mackinley*.—*A. D. C.*—*H. W. W.*—*D. T. (For Markets and Weather, see p. x.)

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 10, 1898.

WILLIAM LAWSON, AND HIS WORKS.

LAWSON was by no means a copious writer, two short treatises only having appeared from his pen, one, *A New Orchard and Garden*, and bound up with it, *The Countrie Housewife's Garden*. The many editions, particularly the earlier ones, through which these passed in company, are not difficult to trace; but with the first there is some difficulty. The last-named work, printed by Bar. Alsop for Roger Jackson, bears date 1617. It is bound with the former, which was "Printed at London by Bar. Alsop for Roger Jackson, and are to be sold at his shop neere Fleet Street conduite, 1618," this forming the first part of the book. Several passages of *The Countrie Housewife* show it to have been written after *An Orchard*, though, as we have seen, it was printed one year earlier.

The late Dr. Hogg, in *The Fruit Manual*, has quoted a few lines from Lawson, and gives date "1597." Then, in the second edition, 1623, which has added to it, *The Art of Propagating Plants*, and in the copy I possess also, *The Husbandman's Fruitful Orchard*, which is a much older treatise, the lengthy title-page is different from that of 1618, one clause of which reads:—"All founded on the principles of Art and precepts of experience, being the labours of 48 yeeres of William Lawson." The end of this clause in the second edition reads thus:—"Now for the second time corrected and much enlarged by William Lawson." It is corrected, indeed, but not enlarged; nor can one understand how a second correction could have taken place, unless there had been a previous one, which, again, could not have occurred in a first edition. Then Dr. Hogg's short quotation contains two words spelled differently from the same words in the first edition, and three words differently from those in the second. Lawson, indeed, confesses in the dedication, to his having possessed the MS. of *An Orchard* for a long time previous to its publication, and it is not improbable that copies in MS. may have been in circulation for many years. In any case, there appears to be mistakes somewhere. The printer of the 1623 edition was John Haviland, and Jackson the publisher. Both editions are small quarto, black letter, and illustrated with many quaint engravings. The second is the more correct edition.

A third edition appeared in 1626 in ordinary type, and with some of the illustrations wanting. Five years later a fourth edition appeared, but this, along with five of Markam's little books, were bound up together, and under the

designation of *A Way to Get Wealth*, these, as one work, passed through as many as fifteen editions before the close of the seventeenth century.

Though little is known of Lawson, it is yet possible, with the aid of his little book, to obtain a very fair conception of what manner of man he was. He was no visionary, as Bacon to a large extent was, nor was he like his contemporaries who wrote on rural affairs, a copyist. He claims for himself to have written solely from experience and practice, and he is certainly one of the earliest original writers on Gardening, from every point of view, purely English. He was well read, but he refused to accept from others what he himself had not proved from practice to be correct. It would be very wrong, however, to assert that everything he penned was original, or in what truly was so, that his opinions were always unassailable. That would be too much to expect of anyone, even now. Lawson, however, believed what he wrote to have been consistent with his experience, and he possessed the happy knack of permeating his writings with much of his own personality. Thus it happens, that those who are acquainted with his works, are, notwithstanding his unwitting blunders, inclined to feelings of real respect for the aged author.

In *An Orchard* he has written at his best. His style, though a little quaint, is always lucid, always charming in its simplicity; often, as on "Ornaments," rising to the highest prose, and in no case ever descends to vulgarity, or to language impossible to read now.

The *Countrie Housewife's Garden*, on the other hand, is as "drumlie" as ditch-water, and possesses no feature of any particular interest. It is, moreover, written in English of a later date; and if the work is really Lawson's, one feels vexed that he should have conjoined it to *An Orchard*.

Lawson, had time and circumstances permitted, might easily have been the author of an earlier *Silva*. As a matter of fact, Evelyn, who was struck with the reasoning by which our author built up the strange theory that, by means of proper culture, Apple-trees were capable of retaining life and fruitfulness for a thousand years; and timber-trees might "require the yeeres of divers Methushalahes," did in 1664 embody this, as well as other long quotations, in his *Silva*.

Not the least interesting matter in connection with Lawson is the place of his residence. Some writers, who must have skimmed his book, have placed it in Holderness, but he himself affords no information of having ever lived there, and he mentions it only as a bit of low country, eminently suited to "fatten cattell." On the other hand, nothing need be plainer than that he was a native of Teesdale, in connection with which, in the chapter "On Foyling" he mentions the occurrence of the stranding of a whale which "came aland at Teemouth in Yorkshire, hard by us." The fact that he lived so far north lends additional interest to his writings, proving as it does the wide field that gardening had covered at so early a period, and the strange fact that English gardening should be represented so well by this "honest countryman."

As we get closer to him, we find Lawson to have been a gentleman, possibly of small estate, and limited means. He was of retired habits, and found his pleasures chiefly in fruit-growing, gardening, and pursuits of a kindred nature. He, however, laboured not over much, "For what," he remarks, "is greedy gaine without delight, but moyling and turmoyling in slavery." Circumstances fitting, he might have been an earlier Isaak Walton, for he loved to sit on a mount in his orchard, and from that elevated position to "angle a peckled trout or sleightie eele" from the silvery river flowing past. He played bowls, but preferred as a more manly exercise to stretch his arms at a "paire of byts." Music was a great pleasure, and it was his delight to sit out-of-doors listening to the playing of instruments, and to voices singing. Nay, we are left just a little dubious whether he himself was altogether ignorant of the fingering of the Sweet Recorder.

A quiet humour pervaded his atmosphere, and so he liked "a maze well-formed a man's height where one's friend might wander in gathering of berries till he cannot recover himselfe without your helpe."

Possessed of a nice eye, he loved to have his walks long and straight, and his orchard-trees "standing in comely order which way soever you looke." His borders and squares planted with flowers intermingled, were orderly placed. His love of Nature was supreme. Songbirds were his dear friends; though it was undoubtedly a "griefe" that the blackbirds and throstles which "sing loudly in a May morning, and delight the eare much, should also eate ripe Cherries or berries." Nightingales, however, he avers, "with their several notes and tunes with a delightsome voice, will beare you company night and day. The gentle Robin-red-brest will helpe her. Neither will the silly wren be behinde in summer with her distinct whistle. Bees, which sing and sit and feede upon flowers and sprouts make a 'pleasant noyse and sight,' loving their friend and hating their enemies."

Of all his pleasures, however, none exceed those derived from the fruit and the flowers of his orchard and garden. He declares "delight to be the chiefe end of orchards." Everybody delights in them, even the very old may find their greatest pleasures there. Paradise itself was but a "garden and orchard of trees and hearbs full of all pleasure. What," he asks, "more delightsome than an infinite variety of sweet-smelling flowers? colouring not onely the earth, but decking the ayre and sweetening every breath and spirit."

Of all flowers his favourite was the "damaske" Rose, but his love for Roses extended also to the "red, velvet, Double Provence, Sweete Muske, and single and double white Roses." Banks of Violets and of Camomile were raised at every available position in his orchard. Walks also were planted with Camomile, and all walks were bordered with sweet-smelling herbs, such as Lavender, Hyssop, &c., and Daisies and Pinks. Behind these the borders were overflowing with a profusion of common but sweet flowers, which also reached the kitchen-garden, but only the finest were admitted into the summer or flower-garden, where grew his Carnations, of which we may be sure he was intensely proud, seeing he had some as large as Roses. Rosemary grew about his door and sweet Eglantine, and it was embowered with trailing Woodbine.

Like Bacon, he cared not for a knot, though he had one in his garden. From Bacon, however, he differed, in that he framed some of his hedges to the shape of men armed for the field, ready to give "battell; or swift-running greyhounds, or of well-scented and true running hounds to chase the deere or hunt the hare;" quaintly adding, "this kind of hunting shall not waste your corne, nor much your coyne."

It is pleasant to note, that in spite of his desire to make profit of his orchard, half an acre of which he considered to be worth an acre or even two of corne, he was not exacting as a master. The gardener, from a list of his duties, held no sinecure's office; but Lawson declares, where there is much to do, a sufficient number of men must be provided to enable the gardener to overtake his various work. A gardener, he remarks, must not be a "lazy lubber;" nor did he care for one who at the same time was a "scholist," and ignorant of his duties. However, to a man endued with capacity and possessed of knowledge, he added to his wages—unfortunately not mentioned—the "fee;" belonging to his place. The latter consisted of "superfluity of herbes and flowers, seedes, graffes, sets," and beside other offall "that fruit which your bountifull hand shall reward him withall will much augment his wages." R. P. Brotherston.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

TWO NEW FERNS FROM BRITISH GUIANA.

DANÆA NIGRESCENS, *Jenman, n. sp.*—Rootstock large, very stout, erect or decumbent; stipites caespitose, stiffly erect, ligneous, wood dull, dark-

brown or blackish, puberulous or glabrous, devoid of nodes, $1\frac{1}{2}$ to $2\frac{1}{2}$ feet long, solid, somewhat angular when dry; fronds 2 to $4\frac{1}{2}$ feet long, $1\frac{1}{2}$ to $2\frac{1}{4}$ feet wide, pinnate, with several erecto-spreading lateral pinnæ 2 inches apart, $\frac{3}{4}$ to $1\frac{1}{4}$ foot long, 2 inches wide, cuneate at the base, and shortly stipitate, the apex cuspidate and sharply serrate, slightly narrower in the lower half, but not distinctly tapering, finely scaly along the costæ, and minutely so over the under surface, chartaceous, the same colour on both sides, the margins even or crenulate—repand when dry, terminal pinna absent; veins very close, once forked from the base or near it, curved as they approach the margin; fertile fronds central, taller, pinnæ $\frac{3}{4}$ to nearly 1 inch wide; petiolate, $\frac{1}{4}$ to $\frac{1}{2}$ inch, terminal present, conform, petioled to $1\frac{1}{2}$ inch; stipes and rachis hollow and flattened when dry, much stouter than in the barren, and as thick as one's little finger, both turning finally black; synangia as in all the other species.

British Guiana, in swampy forest of the upper Demerara River, near the banks. A very large species, 5 to $6\frac{1}{2}$ feet high, standing stiffly erect. It has the same pinnate habit as most of the other large species, but differs strikingly in the hard, ligneous character of the stems, which, without fertile fronds, suggests doubt as to its being a *Danaea* at all. It is the largest species of all. *G. S. Jenman, Demerara, November 1, 1898.*

PTERIS (EUPTERIS) HARRISONÆ, *Jenm., n. sp.*

Rootstock small, fibrous, tufted, scaly; stipites caespitose, slender, erect, dark brown, glossy, naked, 3 to 5 inches long; fronds shallowly 3 to 5-lobed, $1\frac{1}{2}$ to 2 inches wide and deep, papyraceous, transparent, densely pellucid, dotted bright green, paler beneath, glabrous and rather shining, base deeply and widely cordate, lobes broadly rounded, as are the sinuses between; veins flabellate, forked near the base, terminating within the margin in clavate apices, conspicuous by the translucency of the parenchyma, primary branches costate, dark brown, like the stipites, raised beneath, the colour evanescent in the outer third; sori continuous all round the even margin from the apex of the stem; involucre narrow, pale, even, unbroken.

British Guiana, on rocks arising from the great basin at the base of the Kaieteur Fall, growing in masses, each of the aggregated plants forming a small tuft. The thin, pellucid substance, free veins, terminating well within the edge, and sinuously-lobed margin, both lobes and hollows rounded and even-edged, without incisions, mark it well from any plant in the genus. It is named after Mrs. Harrison, the wife of the Government Analyst of British Guiana, who is the third white lady who has visited that great 800-feet deep fall since its discovery by Barrington Brown on his geological survey of the colony, April 24, 1870. *G. S. Jenman, Demerara.*

ORCHID NOTES AND GLEANINGS.

MALFORMED ORCHIDS.

M. LINDEN, of the Horticulture Internationale, Brussels, obligingly sends us flowers of Orchids which are interesting from a morphological point of view. In one of these, a flower of *C. Spicerianum*, or one of its derivatives, the upper sepal is absent, the two lower ones connate into a single piece, and deflexed, so as to fall into the middle line. There are no lateral petals, or rather there is one petal with the form and appearance of a lateral petal, but it is placed in the central line opposite to the normally-shaped labellum. The column has no staminode, and bears only one anther on one side. The stigma is shield-shaped, convex, divided by a central furrow into two instead of three lobes. The ovary is one-celled, with two parietal placentas. In this flower therefore the principal features are the diminution in the number of parts and their arrangement so as to form a dimerous flower.

In a flower of *Cypripedium Lawrenceanum*, the state of affairs was quite different. In the first place two flowers were connate at the base. In one

flower there were four sepals, somewhat spirally disposed, one lateral petal, no lip, but an erect column, with three petaloid staminodes, and two perfect anthers. In the other flower there were six perianth segments, three staminodes, and two anthers. The chief interest attaching to such flowers arises of course from the insight they afford as to the original construction of the flower. Orchids are apparently so abnormal in their forms that it is satisfactory to be able to see there is order in apparent disorder. The expression "Freaks of Nature," is only used to cloak our ignorance. Nature is not capricious, there is order, method, and purpose in all she does, only we poor blind ones cannot always see it.

Two singular abnormal variations in two allied species of *Cypripedium*, in which the distinguishing characters appear in the lower sepals alone, have been received. One, of *Cypripedium Charlesworthi*, from P. J. Tuckett, Esq., Yeldhall Manor, near Twyford, has the lower sepals of the usual greenish hue, having on each side a border half-an-inch wide, of a blush-white colour, which is veined with purplish-rose; in fact, of precisely the same colour as the upper sepal. The other, from Mr. W. Goodliffe, Cambridge Nurseries, Northcourt Road, Worthing, is a bloom of a good form of *Cypripedium Spicerianum*, in which the lower sepals are of the usual pale-green tint, and larger than ordinary, the striking departure being the appearance of some pure white blotches on the margin, and faint traces of lines of white.

CYPRIPEDIUM OR PAPHIOPEDILUM.

In the current number of the *Botanical Magazine*, the editor, Sir Joseph Hooker, thinks that his reasons for adopting Pfizger's generic name are "botanically unassailable; nevertheless, I do not object to the substitution of *Cypripedium* in common parlance." The China Aster *Callistephus hortensis* may still be called by its popular name, although the plant differs by important characters from all the species of the vast genus Aster. Why not consider *Paphiopedilum* to be a sub-genus of *Cypripedium*, and so avoid the use of the former name in gardens?

AUTUMNAL SNOWDROPS.

It is difficult to find a satisfactory collective name for the Snowdrops which flower in late autumn and early winter. Possibly "early Snowdrops" would be better than "autumnal Snowdrops;" but this title seems a little out of place for flowers blooming when the year is dying. Yet they come so late in the season with us in the north, that we may well doubt the propriety of calling them autumnal.

However this may be, we are more concerned with their value in the garden than with the appellation given them. Here, again, there is room for some difference of opinion, for there are many who look upon them as "born out of due time," and as lacking the price-less associations which endear to us the "early herald of the infant year."

Yet their beauty is equal to that of the "Fair maids of February." Their purity is in nowise lessened because the chaste blossoms are exposed to the winds of the last months instead of the first of the year. Their habit is as graceful, their markings as elegant. If the garden is dreary in November and December, a glimpse of one of these Snowdrops brings keen pleasure when we see it dangling from its stalk on the slopes of the rock-garden. Were these Snowdrops better known, they would be better cared for, and more widely grown.

The autumnal Snowdrops are found under various specific names; but it is to be feared that there is little difference between many of the plants except in time of flowering. For practical purposes they may be classed as only varieties of *Galanthus nivalis*—our common Snowdrop. Some, however, are distinct, from the fact that the foliage has a distinctly visible glaucous line down the centre of the leaves; the only exceptions, indeed, with which the writer is acquainted being the Snowdrop known as *Galanthus cilicicus* (figured in the *Gardeners' Chronicle*, February 5, 1898, p. 79), and *G. Rachelæ*. Perhaps this glaucous line may appear in some of the plants of

G. cilicicus, but it does not seem present in any of the specimens I have seen. *G. Rachelæ* practically consists of the progeny of one or two bulbs, so that no variation is to be expected in the few plants of that sub-species or variety in cultivation.

Nominally the first of these Snowdrops to flower ought to be *G. octobrensis*, originally brought from Albania by Lord Walsingham to the Rev. Harpur-Crewe. This Snowdrop, however, does not flower before the end of November here, and the first to bloom this year was *G. cilicicus*, which has, moreover, the advantage of being a more robust grower, and it has finer flowers.

Galanthus Olgae, originally found on Mount Taygetus, Greece, by Orphanides, was for some time lost to cultivation, but a Snowdrop has again been introduced under the same name. I have not been very successful with this *Galanthus*, which should flower in October, and after failing to flower it for two years in succession, it has now disappeared.

G. coreyrensis, originally received from Corfu by Mr. Harpur-Crewe, usually flowers in December, and is rather weak in growth.

Two rare autumnal Snowdrops which I am fortunate to possess through the kindness of Mr. F. W. Burbidge, who received them from Professor Mahaffy, by whom they were found, are *G. Rachelæ*, and *G. Elææ*. The former was obtained on Mount Hymettus in 1886. It is more robust than *G. Elææ*, and is noteworthy as being without the glaucous median line down the leaves. It flowers in December.

G. Elææ is rather weakly in growth, and has small flowers. Among the best of the autumnal Snowdrops I have grown were some received by way of Holland under the name of *G. octobrensis*. Among these Snowdrops names, however, count for little.

The autumnal *Galanthi* are more delicate, as a rule, than those that bloom in the spring, and prefer, I am of opinion, a lighter soil. Mr. Boyd, of Faldonside, advocates lifting them after flowering, but I have not found this to be necessary. They can never, perhaps, reach the position in our affections that the Snowdrops of spring are given; but those who desire their gardens to yield something of interest at all times, will find them acquisitions for their rock-gardens or borders. *S. Arnott, Carsethorn, by Dumfries, N.B.*

MARKET GARDENING ABOUT RAYLEIGH.

THE GLASS-HOUSES.—Early in 1897, Mr. A. Wright purchased the freehold of 33 acres of land (including one or two cottages situated thereon) on the confines of the parishes of Rayleigh and Hockley, about a mile and a half north-east of Rayleigh town and station, the latter being on the Southend branch of the Great Eastern Railway Company's main line from Shenfield. Having completed his purchase and selected a suitable site, Mr. Wright lost no time in erecting thereon a block of thirteen glass-houses for the production of Cucumbers and Tomatos of the best quality for sending to Covent Garden Market, taking a good crop of Cucumbers and Tomatos respectively out of each of the thirteen houses the same year.

The glass-houses are each 200 feet long and 12 feet wide in the clear between the piers, being $12\frac{1}{2}$ feet from centre of piers crossways, thus giving a total end frontage of 162 feet 6 inches. The roof consisting of rafters 8 feet long, affords a capital angle to the sun's rays, and at the same time plenty of head-room. Twelve out of the thirteen houses are built on the "pier system," that is, instead of having continuous division walls the entire length of each house, a series of 9-inch brick piers are built at intervals of 7 or 8 feet for supporting "valley gutters," consisting of pitch-pine plank, 11 inches by $1\frac{1}{2}$ inch, wall-plates being secured on each side of these for fixing the rafters on, and at the same time forming the gutters, when sanded and tarred, for conducting rain-water from roofs to tanks provided for this purpose right across the thirteen houses, at 50 feet from each end. The houses (spans) run north and south. Thus, it will be observed that the

said twelve houses only have two continuous side-walls, one of these forming the division-wall between them and the thirteenth (No. 1) house, which is used for raising the young Cucumber-plants, &c., in, and for this purpose it is provided with a heating apparatus exclusively to itself and two extra hot-water pipes; two flows running side by side (flat-wise) close up to the walls on either side, and returning alongside the central pathway on each side.

THE HEATING ARRANGEMENTS.

The twelve houses, requiring one and the same temperature, are heated by six Thames Bank boilers, three being fixed side by side in two out of the three stoke-holes; the third one containing the heating apparatus belonging to the propagating-house. The six boilers occupy a central position to the end frontage of the glasshouses, and pretty close to the cart-way running in that direction south, and close up

houses of similar dimensions to the block referred to above, three more "Thames Bank" boilers being put in for heating these. This extension of glass-houses will give a total continuous end frontage of 237 feet 6 inches, and is a satisfactory proprietorship for any grower to achieve in less than two years—but it is especially creditable in the case of a young man like Mr. Wright. The nineteen houses will be planted with Cucumbers by the middle of January next, and by the end of the following July the Cucumbers will be replaced by Tomato-plants. Satisfactory returns having been extracted from the Cucumber-plants while remunerative prices prevailed; the Tomatos yielding heavy crops of fine fruit at a time (October and November) when the supplies hitherto obtained from plants growing in cool-houses and in favourable situations out-of-doors have become exhausted. Mr. Wright's Tomatos always command "top-prices" in the market.

intervals crosswise on the three pipes on either side of the pathway; lighter strips being tacked on these pretty closely together in an opposite direction for the reception of a coating of cinders and fine coal-ashes of sufficient thickness to stand the pots containing the Cucumber seeds on. When the young plants have attained a height of 3 or 4 inches, they are shifted into 6-inch pots, using the same description of compost as before; a large quantity of this being stacked at one end of the staging a few days beforehand, to ensure its being of the same temperature as that in which the young plants are growing. A thin stick is put to each plant for support in due time.

GETTING READY FOR PLANTING.

Meanwhile the several houses are being put in readiness for the reception of the Cucumber-plants the first or second week in January. This is rather a "big" job, involving, as it does, the removal of

FIG. 118.—*CISSAMPLOS APPENDICULATA*.

A remarkable Bengal species, shown by Sir T. Lawrence, Bart., at the meeting of the Royal Horticultural Society on Nov. 22. Colour of the flowers white, with purple and chocolate-coloured markings. See *Gard. Chron.*, Nov. 26, p. 391.

to the forcing-houses. A 6-inch flow and return pipe connecting each trio-boilers with the 6-inch mains (flow and return) which run east and west immediately inside each and all of the twelve houses, and from which a 4-inch flow is taken on the either side of the individual houses, the flow-pipes being fixed close up to the piers the entire length of each house, and returning on each side the pathway—four pipes in each house, the forty-eight pipes giving and maintaining a good uniform degree of heat in the twelve houses. A throttle-valve is fixed in each 4-inch flow-pipe, pretty close to the 6-inch main, thereby affording the means for securing a good circulation of hot-water in each and all of the pipes.

THE CUCUMBER-HOUSES.

By way of recording Mr. Wright's enterprising spirit, I may mention that he is now adding six more

RAISING THE PLANTS.

Mr. Wright sows his Cucumber-seed in the first or second week in December, singly in 3-inch pots, using fine soil and short manure (from London stables) in equal proportions. This having been mixed and placed in the propagating (No. 1) house a few days before being used, becomes nice and warm, a circumstance which, when taken in connection with a high atmospheric temperature being maintained, causes the seeds to germinate quickly and evenly. I may remark that the propagating-house is the first in the block which is planted with Tomatos, and the last with Cucumbers, consequently the crop of Tomatos is cleared off the plants in this house first, a fact which allows the exhausted plants to be removed, and the house to be put in readiness for the raising of the necessary number of young Cucumber-plants—about 5,000. Stout pieces of board are placed at short

the soil which formed the Cucumber ridges in January last, and which was levelled in July following when the Tomatos were planted. This has to be wheeled out of the houses, and a like quantity of new compost brought in to form fresh ridges. The average depth of the soil of the garden is 1 foot, this being heavy and resting on a substratum of clay, the latter containing much sand. This soil, rough and fine, as it is taken from the field or "store-heap," added to a like quantity of well-decayed stable-manure, constitutes the compost in which Mr. Wright grows enormously heavy crops of best quality Cucumbers. The soil and manure is well mixed before being wheeled in, and formed into continuous ridges pretty close to, but quite clear of, the flow hot-water pipes. As a guide to readers of the *Gardeners' Chronicle* who may require information on this point, I may say that Mr. Wright gives eight

barrowfuls of the mixture indicated to each 9 feet length of hot-water pipe, the width of the base of the ridge of soil being from 2½ to 3 feet.

The compost consisting, as stated above, of soil and manure in equal parts, naturally ferments more or less when placed in bulk in close proximity to hot-water pipes in a close house, thereby doing away with the possibility of the plants experiencing any check when planted on the crown of the individual ridges by the roots coming in contact with soil less warm than that in which they are growing. The plants are set at 2 feet apart on the ridges, the soil being pressed firmly about them in planting.

TREATMENT OF THE PLANTS.

These receive their first stopping at the fourth wire from the bottom of the trellis, being stopped once again before allowing them to reach the top wire. The lateral growths are pinched when they have extended about 1 foot on either side the main stem, the sub-laterals being stopped at from one to four joints, according to circumstances; that is, they are stopped at one joint where there is no available trellis space to furnish, and at four joints where the reverse is the case. As soon as the roots begin to push through the sides of the ridges, a good surface-dressing of well-rotted stable-manure, that is not likely to become unduly heated after it is subjected to a minimum temperature of 70°, is laid on. The rooting medium is kept uniformly moist throughout the whole period of the plant's growth, and abundance of water is distributed in the houses during the period indicated. The Rochford is the variety of Cucumber which Mr. Wright depends upon.

TOMATOS.

Seed for furnishing plants for planting about the middle of July is sown in the middle of the month of May, and the plants are allowed to become pretty hard in texture of stem-growth before being planted. Mr. Wright is convinced that by having the wood of the young plants pretty firm before being planted, they do not at once rush into growth, which they would do if the plants were transplanted before the pots had become pretty full of roots, viz., by being root-bound the roots do not lay hold of the soil so quickly and make such a sappy growth as would otherwise be the case. A space of from 20 to 22 inches is given between the rows, and a space of 1 foot from plant to plant in the row, the plants being from 6 to 9 inches high when planted out. The individual plants are supported by a length of soft string fastened loosely round the stems close to the ground, and then secured to the wires overhead, and as the plants increase in growth they are simply twisted round their respective strings, thereby tightening the strings, the operation being repeated until the top wire is reached, all side or lateral growths being persistently pinched out. Plants thus treated, in addition to the fact of their being grown in the rich compost prepared for the Cucumbers, and in a free circulation of fresh air, make extra large stems, show plenty of large clusters of strong flowers, which set freely, and the fruit develops to a large size. The variety which Mr. Wright mainly depends upon is "Limbury," one of his own selection. It is a heavy cropper, the fruit being smooth, round, and satisfactory in size and colour.

On the occasion of my last visit (October 24) I found Mr. Wright busily engaged in his large packing-shed, packing for London, several men gathering the ripe fruit, while others conveyed it to the shed, and these Mr. Wright himself packed into peck-baskets (200) for despatching to market that afternoon. Out of this number there were very few pecks of "seconds;" in short, I never before saw such magnificent crops of fine Tomatos—a total yield of 12 tons being secured from the thirteen houses.

THE WATER SUPPLY.

In the summer of 1897, Mr. Wright came to the conclusion that the supply of water obtained from the rain-water tanks mentioned above, and from a small streamlet close by, which was made to empty itself into the said tanks, was likely to prove inadequate another year; so a few months later he

made a good-sized pond a few yards north of his glasshouses, and into which the streamlet indicated ran. The main source of supply, however, is the drainage from the adjacent hills, the result being 6 feet depth of water in the pond during the months of June and July last; but this depth was considerably reduced by the middle of October. All the same, the supply was ample—a circumstance which went to prove that Mr. Wright was justified in having the water laid on in all his houses during the early summer months. The pumping machinery is fixed on the bank of the pond, a strong galvanised iron tank, capable of holding 1000 gallons of water being placed on top of the engine-house, the bottom of the tank being a little higher than the ridge of the several glasshouses, thereby affording a good pressure when the water is being distributed in the houses through three delivery-hoses at the same time.

In conclusion, I may say that Mr. Wright learnt his business in a good school, and that he is always pleased to give practical advice to those of his neighbours whom he can see by a glance are in need of it, being of opinion that there is plenty of room in the trade for those embarking in it as a means of livelihood. Simultaneously with the erection of the first block of glasshouses, Mr. Wright had dwelling-houses put up for himself and his foreman. *H. W. Ward, Rayleigh.*

SOME DEVONSHIRE GARDENS.

(BY OUR SPECIAL COMMISSIONER.)

(Continued from p. 387.)

BISHOPSTOWNE.—At Bishopstowe, Torquay, the residence of Mrs. Hanbury, the large bushes of the common Fuchsia are remarkable. These are met with in many parts of the garden. Many of the plants have a number of stems coming from the base, some of which are as thick as one's arm. One that I measured was 10 feet high, and 16 feet through; whilst another plant, equally high, was just 25 feet in diameter. The local climate seems to suit these admirably.

Upon the lawn I noticed a grand specimen of *Spiræa Lindleyana*, 10 feet high, with a large number of spikes of its white feathery flowers. This plant is so seldom seen, and is of such imposing a nature, that it is one of the most desirable species to plant in the sunny south. Another grand *Spiræa* close by is *S. arifolia*. *Buddleia globosa* is also a grand plant, some 50 feet in circumference.

Another most useful shrub was gay with its pale blue flowers, and at the time of my visit added a peculiar charm on account of the rarity of its colour—I refer to *Ceanothus azureus*. I have met with this plant several times in this district, and can recommend it to planters. *Rubus speciosus* was covered with its white flowers. In the pleasure-grounds were many perfect specimens of choice species of Conifers, Beech, and other ornamental trees. The terrace was gay with Roses, and the house almost enveloped with *Ampelopsis Veitchi* and other climbing plants. Capital effects were obtained in the several flower-gardens with bronze, bicolor, and tricolor *Pelargonium*, and several Ivy-leaved varieties were flowering freely.

In the glass-houses were good crops of finely-coloured Grapes, and of Peaches and Nectarines; the former especially were a great credit to Mr. Moirist, who is a most painstaking gardener. Melons had been good, and Tomatos were ripening well.

A capital lot of *Dendrobium*s were making fine growth; *Cattleyas* and *Lælias* also looked well. *Begonias* and *Cyclamens* in various stages were satisfactory.

The kitchen-garden is maintained in neat and good order, and the crops generally were satisfactory.

KILLERTON, the seat of Sir Arthur Acland, Bart., may be easily reached from Silvertown station, on the Great Western Railway, and by road is 7 miles from Exeter. The family have for some three centuries made their home in this district. The house was built in 1788, but it was much enlarged by the grandfather of the present baronet. Of Sir Thomas Dyke Acland, it is only necessary to remark that the

position he occupied in the county and in the country was evident from the universal respect shown in May last, when he was laid to rest in the presence of a large company of sorrowing friends.

Killerton has many fine features. The gardens and park are now in excellent keeping, and are under the care of Mr. J. Garland, who has for forty years had charge of them. The park is of great size, beautifully undulating, and it affords many fine scenic effects. It was very interesting to listen to Mr. Garland as he referred to choice trees, as single specimens or clumps, *Coniferae* or deciduous trees that had attained a height of 40 and 50 feet, and were planted by him as saplings, &c., during the earlier years of his charge. The planting was done with great discrimination, and whilst there are *Coniferae*, forest trees, singly and in groups, there are also splendid vistas between. Nearing the mansion, which was charmingly covered with climbing plants, I noticed *Akebia quinata*, *Stauntonia latifolia*, *Chimonanthus fragrans*, *Magnolias*, *Roses*, *Euonymus*, &c. Here are specimens of *Cedrus Deodara*, seedling plants from which exist in various parts of the park. *C. Libani*, of unusual size, and specimens of *Larch* also, of large proportions. Of *Sequoia gigantea* there are noble trees in splendid vigour. Avenues of *Cupressus sempervirens*, include trees that are losing some of their earlier beauty, and as opportunity offers they are being replaced by medium-sized plants of *C. Lawsoniana erecta viridis*. *Pinus insignis* is very common, and there are large specimens of the Tulip tree. *Quercus latifolia* and *Q. latifolia glabra*, fine examples of the evergreen Oaks; a couple of trees of *Q. coccinea* were next observed, afterwards *Pseudotsuga Douglasii*, some planted about thirty-eight years ago, now grand well-proportioned trees. Oaks, Pines, and Cedars, including a tree of the Lucombe Oak. The age of this Oak is said to be 120 years[?], and was originally planted by the head of the firm of Messrs. Veitch & Sons. This grand tree is 14 feet in circumference 3 feet from the ground, and rises with a clear stem 20 feet ere there is a branch. *Thujaopsis dolabrata* I have specially marked as a most perfect tree, dense and compact, of a splendid dark, shining green. This grand pyramid is from 35 to 40 feet high, its lower branches right down to the green sward. There are Bamboos in fine clumps, with many masses of *Dracæna indivisa* that had been cut down with frost some three years ago last March, and now are fine masses of six or eight plants, 6 feet or more in height. Choice hybrid *Rhododendrons* have been planted in a long Laurel border, and are now well established; the Laurels are constantly reduced in bulk by the saw and axe, and shortly the *Rhododendrons* will be given the space to themselves. *Thujaopsis borealis*, 45 feet, is in perfect health; so, too, are *Cupressus macrocarpa*, 60 feet. Other choice species are *Desfontania spinosa*, *Retinospora ericoides*, glorious masses, some 8 feet high, of a deep purple sheen; *Rhus Cotinus*, very large; the Sikkim *Rhododendron cinnabarinum* or *Blandfordiana*; *Cupressus torulosa*, and *C. Goveniana*; the *Berberis asiatica*, and *B. vulgaris*; *Euonymus sanguineus*, with its scarlet capsules and orange-coloured seeds; a magnificent *Araucaria imbricata*, whose trunk at 3 feet from the ground measures 7 feet 6 inches. The *Cedrus Deodara* glen includes a splendid tree planted some sixty years back, now rising to a great height. The Beech avenue also is interesting, the trees having clean stems and fine heads. The Beech is one of the finest trees that can possibly be used in a landscape.

The flower-garden was still gay when my visit was made. In a herbaceous border I noticed a row of the *Salvia patens* and *Calceolaria amplexicaulis*, and the blending of the two colours was most pleasing. An old-fashioned conservatory contains large *Camellias* planted out in the border.

In the fruit department, Mr. Garland has gained many prizes during the years he has been at Killerton. The hardy fruit this season was abundant, and excellent in quality. In the orchard are Apple-trees some fifty and sixty years old, but they were mostly sorts fit only for cider-making, until Mr. Garland grafted them with the best varieties obtainable, and as any

new and good sort now comes to the front, a tree will be grafted with it. They soon make fine heads, and give plenty of fruit. In one season 1300 grafts were inserted, the branches having four, six, or eight crown-grafts put in. These have grown with splendid vigour, and grand branches have been formed, which have brought fruit of large size.

From the orchard to the kitchen-garden is but a step, and here were wall trees, espaliers, bushes, and cordons, on which choice fruit was still hanging. The Pear-trees on walls were three-stemmed cordons 10 to 12 feet high, as well as horizontal trained trees. Many Apples were grown as two-stem cordons and espaliers on wires, and the fruit on these were intense in colour and large in size. On a vinery-border were some of the finest Zinnias I have seen this year. The wall at the end of this border was most beau-

border in front of the gardener's house were fine clumps of *Dracæna indivisa* and *Pelargoniums*, that stand out all the winter. In some seasons they are cut down a little, but in others they pass uninjured.

It was a pleasure to meet so practical a *confrère* as Mr. Garland, and to know that he has now served three baronets.

ANTHURIUM CRYSTALLINUM VAR. ILLUSTRE.

FEW finer stove foliage-plants of dwarf habit exist than *Anthurium crystallinum*; and with the exception of *Phrynium variegatum*, still fewer that are less injured by a short sojourn in the rather inimical conditions of a dwelling-room. Unlike *A. Andreanum*, *A. Scherzerianum*, *A. Lindenianum* and

I sent a man specially to fetch it, not at that time knowing the size of the plant. The journey to and from Bohemia occupied from November 23 to December 3, and you may guess my surprise when I saw the tiny specimen."

THE PAST LILY SEASON IN SCOTLAND.

THE season of Lilies, in my own garden at least, is only just past, for I have had to a late date, *L. speciosum* Kraetzeri and a late-flowering *L. longiflorum* Harrisii in bloom. The weather in summer and autumn in Scotland was pre-eminently favourable to the Lily. From the first of the *L. davuricum*, which appeared in the end of June, till the last of the beautiful and fragrant *L. speciosum*, there was one long, uninterrupted period of bloom. *Lilium candidum*, indeed, was not so strong in growth, nor so floriferous as usual this year; this may have been largely attributable to the fact that, during the previous winter, I had taken the liberty (with Nature) of thinning out the somewhat too crowded bulbs, which, I have always read, is a process of subtraction, which this almost too conservative Lily, which seems to delight in having a numerous family closely crowded together, strongly resents. However this may be, *Lilium candidum* certainly did not grow during last summer to its normal height and strength; its flowers, therefore, so remarkable for their fragrance and purity, did not produce the same impression as in former years. Next season I will look for more commanding growth, when the recently-transplanted bulbs are in perfect correspondence with their environment.

My other Lilies, however, were a greater success. I have never seen the various forms of *Lilium longiflorum* grander than they have been this year. Of these by far the strongest growing and most enduring is the variety entitled *L. longiflorum giganteum*, imported in large quantities into this country from Japan. Home-grown bulbs, if obtained from trustworthy sources, seldom fail. There are several forms of this fine Lily, of comparatively recent introduction, which, however, I do not find by any means so valuable for garden culture as either *L. l. Harrisii* or *L. l. giganteum*. *L. longiflorum Wilsoni* is a notable variety, and produces large flowers. *L. Takesima grandiflorum* is more sparing of its blooms; but they are of great substance, and the foliage of this variety has the merit of distinctiveness. The bulbs of *L. longiflorum formosanum* are very small compared with others, and like those of a widely different Lily—*L. Krameri*—very liable to decay. There is also another and somewhat stronger new variety—not very prolific from a floral point of view—which Dr. Wallace calls *L. longiflorum foliis albo-marginatis*, with variegated leaves. All of the longiflorums are highly ornamental; but *L. giganteum*, *L. Harrisii*, and *L. Wilsoni* are by far the most valuable.

The members of the great Martagon section have this special characteristic, which should not be forgotten by the impatient cultivator—that they take a long time to establish themselves. *Lilium Humboldti* has of late been greatly written down by writers who have found it, manifestly, very difficult of cultivation; such is very far from being my experience, for it grows stronger and blooms more effectively with me year by year. I have, on the other hand, experienced considerable difficulty with *Lilium pardalinum*, which evidently has not found the peculiar soil its nature demands. But this also is a variety which requires a long period for its adequate establishment; in this respect it is even more exacting than its great Californian rival, *Lilium Humboldti*; such at least is the result of my personal experience. *Lilium Szovitzianum*, one of the stateliest and noblest of the Martagons, is, during its flowering season—the beginning of July—one of the grandest ornaments of my garden. I cannot say that I have hitherto been very successful with Martagon album, but *Lilium dalmaticum* and *Lilium chalcedonicum*, better known to ordinary cultivators as the "Scarlet Martagon," grow and blossom luxuriantly

FIG. 119.—ANTHURIUM CRYSTALLINUM VAR. ILLUSTRE.

tiful, being densely covered with *Thunbergias aurantiaca*, *alba*, and *alata*, full of their charming flowers, whilst rambling near by was a clump of *Convolvulus mauritanicus*, almost hidden beneath its pale purple flowers; Tea Roses still carrying fine blooms, and masses of *Portulacacas* blooming very freely, also *Daphne indica rubra* in the best of health.

The four vineries looked well. Begonias, zonal Pelargoniums, stove plants, Ferns, &c., were noticed in the glass structures. The Peach-trees on the walls had borne well, all fruit was gathered, the trees were still full of healthy foliage. A field of two acres has grown Potatoes regularly for twenty years, and has never been dressed during that period with stable-manure. The soil is a rich red loam, on red sandstone, and the garden litter, leaves, trimmings, &c., are used on this plot. Good crops are always obtained, the drills are made 3 feet apart, and a row of Turnips had been sown between the rows. In a

others, with handsome spathes and spadices, the chief beauty of this plant lies in its leaf colouring, which in the type is velvety-green, with crystal-white veins. This variegation is not very constant, but it disappears more or less as the leaves age.

A plant of the variety *A. c. illustre* (fig. 119) was shown at the Drill Hall by Mr. R. Gulzow, Melbourne Nurseries, Bexley Heath, on October 25 last. The leaf colouring, as compared with that of a plant of the type species standing alongside, was decidedly superior, but it remains to be ascertained if it be more constant than in the species. The exhibitor relates the manner in which he acquired the plant: "*Anthurium crystallinum* var. *illustre* I purchased from a private garden in Bohemia in Nov., 1893 and it appears that it originated in a similar way to *Dracæna Lindenii*. The plant, at the time of purchase, was in a small 60-pot, with a portion of one leaf only, and not expected to live, on which account

here, the former often reaching an abnormal height. It is evident from his sacred Epic, *The Light of the World*, that Sir Edwin Arnold regards *Lilium chalcidonicum* as a native of Palestine, but there is only one Lily, as Mr. Baker has informed me, that belongs to this region, viz., *Lilium candidum*, which "grows very sparsely among the mountains of Lebanon."

Lilium Browni and *Lilium Kramerii* did not achieve much, so far as I can learn, in Scotland this year, they did not grow with their customary facility, and their flowers were, consequently, comparatively few. At Logan Gardens, in this parish, the most effective Lilies were *L. excelsum*, and *L. giganteum*; of which the latter was especially fine. Many of the grandest specimens of *L. auratum*—with one or two notable exceptions—were destroyed, or at least greatly mutilated at Logan by the high winds which prevailed during the flowering season; here, where they found more shelter, I was more fortunate, and the plants flowered in most instances splendidly. Mr. McDonall of Logan, had, however, two plants of *L. auratum* adequately protected, which proved veritable giants; reaching a stature of nearly 9 feet, and producing a great number of magnificent blooms.

But I think the most valuable of all Lilies this season has been *L. speciosum*, and especially the exquisite variety entitled *s. Kraetzeri*, whose snowy-white flowers, with their shining green bands radiating from the centre, produce invariably memorable effects. Very beautiful also are *speciosum rubrum*, *s. roseum*, and *s. Melpomene*. *David R. Williamson, Wigtonshire.*

FORESTRY.

THE ECONOMIC MANAGEMENT OF FORESTS.

I WAS much interested in reading in the columns of the *Gardeners' Chronicle* an article on forestry, entitled "Our Woods and Forests," in which the author attacks the management of our State forests, and in particular that of the Forest of Dean.

I should like to say a few words in defence of the management of this forest. The author alludes to a working plan which has been prepared for the Forest of Dean, but I think the following passage shows that he does not understand the object of it. The passage I refer to is: "Proper management is impossible until some definite plan of operations is formulated by the authorities, and adhered to throughout a lengthened period of time." Now the principal object of a working plan, after collecting all data about the forest, and after a consideration of all influences that affect it, is to lay down a definite plan for the forest which must be absolutely adhered to, and cannot be altered with every change of the staff. Now the policy laid down in this particular working plan for the Forest of Dean, is to work the forest so as to obtain the best financial results, and in fact to turn the forest into a large "timber-farm."

It is urged that no provision is made to improve the æsthetic education of the public. It is well known that Government departments are always careful in matters of £ s. d. But because a forest is managed on economic principles, it does not follow that such a forest should be unpicturesque.

The forests on the alpes of the Alps, and on the banks of the Rhine, are managed entirely on economic considerations, and yet they considerably enhance the beauty of the scenery. Personally, I consider that the scenery on the banks of the Wye near Symond's Yat is beautiful as it is, but if it is thought that the coppice is unpicturesque, it may be interesting to learn that, in accordance with the provisions of the working plan, it is intended (solely on account of economic considerations) to gradually convert the coppice into a two-storied high forest with an overwood of Oak and Larch, and an underwood of Beech and Spruce.

But I think that the management of the Forest of Dean on sound economic principles (which I think we may infer will be the case, from the fact that an elaborate working plan has been prepared with that object in view) will accomplish a far higher object than mere pecuniary results, namely, it will furnish a standard which landowners intending to form forests can imitate with advantage.

On visiting the Continent, one is naturally struck by the immense area covered by forests, and one may have wondered why this is not the case in England. But I think this may be explained by the fact that there is a general impression in England that forestry does not pay. That this impression is correct with the present methods of management, I can well believe; but that forests may be made to pay, can, I think, be proved by the fact that continental forest owners find it well worth while to export timber to England in order to obtain relatively high prices.

On the Continent, where economic forestry is thoroughly understood, working plans are drawn up for each forest, with a view to obtaining—firstly, the best financial results; secondly, equal annual returns, and moreover the officer in charge of the forest is generally a man who has had a thorough training in a State forest-school, and can consequently carry out the provisions of a working plan intelligently. Under similar circumstances, forestry could be made to pay in England, the more so as climatic and other influences are more favourable to tree-growth, and as the prices of timber are higher.

If the authorities of the Forest Department in England benefit by the knowledge and experience of the continental and Indian foresters, and so direct the management of the Forest of Dean, so that it shall be a pattern of a financially successful forest which private owners may copy, I think they will accomplish a higher object than the mere improvement of the æsthetic education of a few tourists to Symond's Yat. *H. C. Walker.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Forcing of Potatoes.—A sufficient number of sets of Royal or of Myatt's Ashleaf, or Sutton's A 1 should be selected from the more forward of the stocks and be placed on end, eyes uppermost, in shallow boxes, or on the floor or border of an early vinery. Any light kind of soil may be used to fill in with round the tubers. When sprouted an inch, rub off all but two, or, at the most, three strong sprouts. In the meantime, the forcing-pit or frame should be prepared, filling it with new tree-leaves and stable-litter, two-thirds of the former; and when the heat has risen, make it firm and level, and cover with about 10 inches of light rich soil, and on this getting warm throughout, plant the sets at 10 inches apart in the rows, the latter being 12 inches asunder. There is no necessity to plant wider than this, the moulding-up being done by covering the whole surface with warm soil when the proper time comes. The top-heat at the beginning should not exceed 45° at night or 65° by day; the bottom-heat of the hot-bed should be kept steady at 75° to 80°; and if it be inclined to increase, as is nearly always the case in very mild weather, holes must be made here and there in the mass by means of a sharp stake, in order to let it escape, affording air in small quantity, to allow of the escape of the heat and steam.

Rhubarb.—A sufficient number of Rhubarb roots to last for some weeks should be placed at about this date in a cool shed, in readiness to be put in the forcing-house as may be required to meet the demands of the cook, a few of them at a time being placed in heat. Rhubarb in full growth in the forcing-house will require plenty of water.

Radishes.—Continue to prepare hot-beds for Radishes, covering them with a layer of rich light soil 8 inches in depth. When the temperature of the frame is steady at 60°, sow seeds of any of the approved varieties, either long, oblong, or round-rooted.

Endive.—Some plants which are almost fully grown may be introduced to a warm frame or pit, in order to blanch them. Plenty of air should be afforded Endive growing in cold frames and pits.

Seakale.—In order to ensure a stock of roots, when hard frosts seal the ground, a good number should be lifted and stored under cover for forcing as may be required. When the roots are forced in the open where they grow, the groups of plants should be covered first with fine coal-ashes. A certain number of these may be forced by packing fermenting stable-dung and leaves about and above the pots, making this fairly firm. The chief danger is overheating. In order to avert any risk from this cause, test stakes should be stuck into the materials here and there, and when these, on being withdrawn,

indicate a greater degree of warmth than is desirable, some of the materials must be removed for a time.

Onions.—If Onions are required in the young state, seeds may be sown in a gentle heat, either on a bed of soil or in boxes.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

The Peach.—Brown scale often infest these trees, and the present affords a suitable time to get rid of it. After cutting away superfluous branches, loosen the branches from the wall, tying them loosely in bundles. Remove the insects with a thin piece of wood, and thoroughly scrub the old wood with a solution of soft soap, or Gishurst Compound-soap, mixed at the rate of 4 oz. or rather less to the gallon of soft water. The wood of the current year must not be touched with a brush, because the buds are easily damaged, but wiped with a sponge after loosening the scale with a strip of wood. Scale on the young wood is usually young, small, and pale in colour, requiring a close search to find it. After the shoots are sponged, or scrubbed, the tree should have a syringing with clean water at a temperature not higher than 140° in order to detach the eggs and young fry; after giving another search for any that may have escaped removal, the trees will be ready for fastening to the wall again to prevent injury from frost, this being especially necessary if the wood is imperfectly ripened, as it often is in cold districts. Peach-wood that is hard and brown in colour is better able to withstand severe cold, and is loosened from the walls by some gardeners, and secured at a distance from it during the winter, with the object of retarding the flowering period in the spring; but I do not advise this course, there being always a danger that the pith will be injured by frost, although the rind may show no sign of it. This freezing of the pith is a cause of weakness, and leads to the decay of the branch—it may be years afterwards. I prefer to protect the trees thoroughly when they are in flower in the spring. In cold districts glass copings which have been removed for the benefit of the trees during autumn rains, may now be fixed up, in order to keep the trees dry, and better prepared against severe frosts.

The Fruit-room.—The fruit in store should be examined once every week, and decaying fruits removed without disturbing those that are sound, handling or rolling the fruit on the shelves after they are ripe causing decay to be set up. Where fruit is placed in one layer, examination without moving them is easy; and where there are several layers, the upper ones should be removed carefully, and placed elsewhere, and then the bottom layer can be readily examined. The sweating of the fruit will now have entirely ceased, and the amount of ventilation afforded whilst this was going on will not now be needed or desirable, as the admission of air will now cause the rind to shrivel. The temperature of a fruit-room ought not to go below 35°, and fruit is kept in better condition if a steady temperature of 40° can be maintained. The use of fire-heat should be avoided as far as may be; much good may be done in severe weather by defending the doors and windows with thatched hurdles or the like, and covering the fruit with sheets of paper. When a thaw follows a period of frost, the outside air should not be admitted in greater volume than can be helped, as being higher in temperature, it settles on everything in the fruit-room, and thus tends to set up decay. At such times it may be advisable to use the warming apparatus to raise the warmth of the room. Pears may be hastened and even improved in flavour and texture by placing them, a few at a time, in a warm cupboard having a temperature not higher than 55°, but they must be kept in it only till they are fit for eating, or the flesh will become mealy.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Chrysanthemums.—Some shoots fit for making cuttings will now be obtainable from most of the varieties. Having stripped off the lower leaves for an inch or thereabout, cut the shoot squarely across below a joint, and without delay insert them in pots of light sandy soil. Those intended to form single-flowered plants should be put singly into small pots. Where numerous bushes are grown, boxes may be used for striking. If the rust has been present, the cuttings should be dipped in a weak solution of sulphide of potassium, made with an ounce of it to one gallon of water; even if no rust was present, it will be advisable to dip the cuttings. If sulphide of

potassium be not used, Quassia, or XL-All will suffice, and a dipping will free them from green-fly for some considerable time. A pit or frame where heat is at command to exclude frost when necessary will be found suitable for propagating purposes. Should sufficient cuttings be inserted as to fill the space at command, well and good; if not, the cutting-pots may be plunged in large boxes filled with cocoa-nut fibre refuse, covering them with sheets of glass. Having inserted the cuttings, afford water, and during periods of sunshine let the cuttings be shaded, so that there is no flagging of the leaves. A temperature of 45° at night should be maintained, and the boxes or frames kept close till rooting becomes evident, then admit air, and increase the amount by degrees. The glass coverings should be wiped dry daily. Chrysanthemums which make little if any growth from the root-stock at this date, should have the root-mass reduced, and be potted in smaller pots, and afforded a temperature of 48° to 50°. Such varieties will produce useful shoots in a short period of time.

Primula obconica.—This plant should be afforded a temperature of 50° at night and 60° by day, as if grown cooler the foliage is apt to become of a sickly yellow colour, and the flowers unsatisfactory.

Lilium candidum.—Those bulbs which were potted early will soon be pushing up their stems, needing a temperature of 45° to 50° at night, with which the growth will not be hastened unduly; anything higher than these figures inevitably spoiling the plants, as would also lack of ventilation. If green-fly infest the new growth, the house should be occasionally fumigated.

Cyclamens.—These plants will now be showing bloom, and requiring the occasional aid of mild manure-water, varied with clear soot-water. Any seedlings that have grown large enough to be readily handled, may be pricked off into pans filled with a compost consisting of fibrous loam, leaf-mould, and silver-sand, in equal proportions, ample drainage being afforded. A shelf near the glass in an intermediate-house affords suitable accommodation for the pricked-off seedlings during the winter.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford, Kent.

Walks.—The present affords in most establishments a favourable season for undertaking the formation of new walks and roads, or the repair of such as exist. In regard to old ones that have got of various widths, it is the proper method to run a line of pegs down the centre as far as it may be adjudged, and having got these fixed to your liking, measure out the path anew from these, inserting wooden pegs on either side to mark the distance to which the turf must be brought. The same method must be adopted when making new ones, with the additional proceeding of taking the dead or hanging level of the road or walk along the middle line of pegs, which will mark the apex or top of the curve of the surface; this should decide the height of the turf-margin or box-edging, as the case may be. This line of pegs affords a ready means of measuring the depth of the excavation for the road materials. The depth will vary from 1½ foot in the case of a road that will be much used, to ½ foot for narrow walks. On each side of the excavated line of road or walk, a V-shaped drain, 9 inches deep, should be cut, and drain-pipes, or macadam, laid along it, so as to carry off water falling on the surface, the drains being laid on the slope, and conducted to an open drain or dry well; and along this line catch-pits, 9 inches to 1 foot square, should be built and fitted with gratings. Where the soil is gravelly or rocky, or chalk approaches the surface within 2 feet, such drains are scarcely called for, the percolation of the water to lower depths being certain and rapid. It may be said here that chalk forms a good lasting foundation for a walk, if it be placed 9 inches under the surface, and frost be not allowed to act upon it before it is covered. The filling-in of the excavated walk may be carried out with any available hard materials up to within 6 inches of the actual level of the surface, and receive a coating of granite, flint, whinstone, or other kind of macadam 3 inches in thickness, and finally a coating of coarse gravel, 2 inches; and one of fine gravel, 1 inch thick. The whole of the coarse materials should be compacted with rammers as each layer is put in, and finally the gravel surfacing should be well rolled. That with which walks and roads are covered differs greatly; in some parts binding gravel is the substance solely employed; in others, hogget, that is, gravel about the size of horse-beans, which makes a clean walk in any weather, being always

dry, but it is a dangerous sort of material in the vicinity of grass that is mown with machines. A similar kind of gravel is made from granite and whinstone, but a walk or road made of this kind of material is firmer under foot, and more pleasant to walk upon; at the same time its colour, blue-black when wet, and grey when dry, is not much liked, at least in the grounds round the dwelling, and it does not, in either condition, contrast well with turf. For forming a walk where such is not desirable, its inconspicuous colour, when seen at some distance, is a point in its favour. In many seaside gardens shell-gravel or coarse sand are employed, none of which forms a binding walk, but it presents a loose surface, and the top coating should never be more than half-an-inch deep, and when dirty it should be carted away, and fresh laid down, for when once it has got in that condition, it becomes a most prolific weed-bed that no amount of hoeing and raking can keep them clean for more than a fortnight. Stoncrop is a great pest on such walks.

Lobelia cardinalis.—Any of the plants left in the beds should now be lifted, and placed in a cold-pit for the winter, some of the plants being potted if a large stock is required. These may be placed in an intermediate-house, and propagation may go on during the winter by taking off the shoots with a bit of the root attached.

General Remarks.—While open weather lasts, planting should be pushed on, as most of this kind of work will be stopped on frosts occurring. The same remarks apply to turfing and the renovation of lawns and grass-verges. See that no newly-planted tree or shrub suffers from wind-waving, but afford to each one or three stakes, and big trees three guying-wires, fixing these to large stumps driven deeply into the ground. Make creepers on walls secure against wind and snow, and afford the roots a mulching of rotten manure. The cuttings of Calceolarias recently inserted, and of bedding Pelargoniums, should be carefully afforded water, and have all dead leaves removed from them at frequent intervals.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorset.

Affording Water in Winter.—There are few details in Orchid cultivation during winter that require more care than that of affording water to the plants. The tendency is to give too much, and to maintain the atmosphere too moist. More plants have been killed by excessive watering than from all other causes combined. I would therefore advise inexperienced cultivators, whenever they feel doubt upon the matter, to keep the plant on the dry side rather than on the wet, especially in conjunction with a low temperature, or if the plants are in large pots.

In the East Indian-house many of the Aërides, Saccolabiums, Angreæums, Rhynchostylis, Stauroopsis, Renanthera, Sarcophilus, Sarcanthus, Thrixspermum, and the warm-growing Vandas, are now through their growing season, and although such plants are never absolutely at rest, they require to be treated, in a measure, as resting plants, and the longer they can be kept in a state of semi-inactivity, the more vigorous and floriferous will be the new growths. These species should never be permitted to become quite dry at the roots, but the sphagnum-moss should become of a whitish-green colour before a fresh supply of water is given. When affording water, do not saturate the moss, but merely sprinkle the surface, so as to keep it alive. Epiphytal Orchids, as Phalaenopsis Schilleriana, P. Aphrodite, P. amabilis, P. intermedia, and others that are developing their flower-spikes, should be given similar treatment. It is not a safe practice to dip the baskets into water at this season, because the compost then remains wet for a very long time. Neither should the foliage be unnecessarily wetted, and especially must the centre of the plant be kept free from water. The deciduous variety of Phalaenopsis Lowii now in flower, after its leaves have fallen, may be kept somewhat drier than other species. Such evergreen Orchids as Phaius, Cyrtopodiums, Eulophiella, Anæctochilus, Bollea, Pescatorea, &c., require less rest than any other Orchids, but when they have flowered they should be sparingly watered for a few weeks. The deciduous Calanthes, when their flower-spikes have been removed, should be kept quite dry at the root until the season for repotting them arrives.

Species that require Extreme Treatment.—The deciduous Catasetums, Cycnoches, Mormodes, Cyrtopodiums, and Chysis, appear to require a rather

different atmosphere to most other Orchids, in order to thoroughly mature the pseudo-bulbs. A small glass-lobby, facing south, is just the place for them when growth is completed. Suspend them to the roof with the foliage nearly touching the glass, and afford them plenty of water until the leaves fall away. Maintain a dry atmosphere, and temperature of 60°, without sun-heat. The bulbs will then finish up plump and hard, and if well ripened in this way, the plants will require no water throughout the long resting period. In the East Indian-house the leaves would not fall away nearly so quickly, which is a decided disadvantage.

Dendrobiums, especially the deciduous kinds require a long resting season, and they should be exposed to as much sunlight as possible. They need no water unless the pseudo-bulbs show signs of shrivelling, in which case a small quantity may be given from time to time, to keep them in a healthy condition. The evergreen section, as D. thyrsiflorum, D. densiflorum, D. Griffithianum, D. Farmeri, D. Schroderæ, D. chrysotoxum, D. suavisimum, the nigro-hirsute species, D. Lowii, D. eburneum, D. formosum, D. cruentum, D. cariniferum, &c., and the cooler-growing varieties, D. infundibulum, D. Jamesianum, and D. Wattianum, should be kept slightly moist at the root when at rest. The new D. spectabile, D. Johnsoniæ, and D. D'Albertsii, need also to be kept warm and moist; as if the plants are allowed to become very dry at the roots, the leaves invariably "spot." D. Phalaenopsis, D. stratiotes, D. taurinum, D. bigibbum, and others of that section, require but little water while at rest, but they prefer to be in a warm, sunny position.

Lælias and Cattleyas never all rest together; therefore they should be treated accordingly, the object being to afford just sufficient water to keep the pseudo-bulbs and leaves from shrivelling too much. Lælia anceps and its numerous varieties should be kept rather dry after flowering, so as to induce the plants to take a short rest, and afterwards to make many roots.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Pot-Vines.—Forcing having in some instances commenced some six weeks ago, the canes will have burst into bud from bottom to top, rendering it at once necessary to secure them to the trellis. The temperature at this stage should range at 55° at night, 60° in the daytime with fire-heat, and 10° more during periods of sunshine. The syringing of the Vines should be performed once on fine days, and that in the morning; genial growing conditions being caused by moistening the floors, walls, &c. Ventilation may be afforded in small amount at the highest part of the structure whenever the outer air is mild enough to safely allow it.

The Grape-room.—Whenever there are several vineries, and grapes have to be kept to a late date, a cool, dry, frost-proof room, or one provided with a stove for keeping out frost and drying the air occasionally, should be constructed; and if it have no connection with the outer walls, so much the better, as its temperature will then be unvarying. Where this cannot be obtained, there should be a matchboard lining to the walls, with considerable air-space between. The ceiling should be provided with a large ventilator in the centre, and another in the wall, also a window with movable sashes, and shutters to exclude the light. The bunches being cut with 6 to 8 inches of the shoot, are stuck into champagne or other wine-bottles, three-quarters filled with water, into which some powdered charcoal is dropped. The bottles should lean slantingly against a rail, so that the Grapes may hang away some distance from the sides of the bottles. The racks for holding these bottles should range in tiers one above the other, and be so constructed as to be readily examined. The best time for pruning late Vines is early in January, and the Grape-room should be put in readiness shortly for receiving the stock of bunches.

Materials for Making Vine-border, Surfacing, &c.—The season's requirements in the matter of soil should now be calculated, and if the stock on hand is unequal to the probable requirements of the garden, advantage should be taken of open weather to cart in what is required. A stock of old plaster and mortar, and brickbats, should be obtained from the builders. Charred soil from the garden smoulder-heap, and wood-ashes made from green young brushwood, trimmings of bushes, &c., will likewise find employment in making new fruit borders.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, DEC. 13. { Royal Horticultural Society's Committee.
Eastbourne Horticultural Society, Meeting.

SALES.

WEDNESDAY, DEC. 14. { Continental Plants, Roses, Libres, &c., at Protheroe & Morris' Rooms.
Unreserved Clearance Sale of Orchids, Plants, Furniture, and Effects, at Beddington Villa, Bandon Hill, Croydon, re J. Seeger, dec., by Protheroe & Morris.

FRIDAY, DEC. 16. { Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—40° 6'.

ACTUAL TEMPERATURES:—

LONDON.—December 7 (6 P.M.): Max., 53°; Min., 44°.

PROVINCES.—December 7 (6 P.M.): Max., 50°; Scilly; Min., 38°; Stornoway.

Heavy rain; dull; mild.

The Action of Manures.

SOMEWHAT to our surprise no one has ventured hitherto to contest the accuracy of a statement made by Mr. HALL at the outset of his very instructive lecture at the Royal Horticultural Society on the 22nd ult. The lecturer began by drawing comparisons between the farmer and the gardener, by no means to the advantage of the latter. Doubtless, from the lecturer's point of view, he had a certain amount of justification. If, however, it is to be taken as a general statement, we must emphatically protest against its correctness. Take the average head-gardener and the average yeoman or tenant-farmer, and then ask which is the better cultivator? There can be but one answer to such a question. The gardener is far ahead of the farmer. The gardener is less affected by the influence of seasons and of climatal variations because he has better means of rendering himself independent of them. Indeed, the gardener enjoys many advantages of which the farmer, from the necessities of the case, cannot avail himself, and thus it happens that the gardener gets not only greater variety of produce, but that produce is relatively of greater value and much greater in amount. Who can estimate how much more the gardener gets out of the land than the farmer?

Farmers and gardeners alike indulge in much quackery in the employment of manures, of whose nature they know little, and of whose mode of action scarcely if any more. They are

as credulous as the purchasers of quack medicines, of Lentil flour, or other substances palmed off under fanciful names at exorbitant prices. Of course, this remark does not apply either to all farmers or to all gardeners; but, still, the general statement is unfortunately too true.

As to the action of manures, both classes of cultivators are apt to lay disproportionate stress upon it. Compared to water, air, and the action of light and heat, the influence of manures is relatively small. Weight for weight, the plant derives infinitely more from the sources just mentioned than it does from the soil. Of course, no one will doubt the importance of the constituents of the soil, and we have not the slightest intention of belittling their influence. What we wish to do is, to caution the cultivator against indiscriminate reliance upon chemical analysis, either of the soil or of the plant. The analysis of a particular sample of soil only shows the constitution of that soil at a particular moment, and when subjected to tests or conditions which do not occur in Nature. The soil is not the inert substance it was once supposed to be; it teems with living organisms, which profoundly modify its relations to the plant. Water, heat, light, air, exert powerful influence on the soil and its contents, just as they do on the leaves. The leaves are often compared to a laboratory, in which endless changes and combinations take place under more or less known conditions. It is the same with the soil. A chemical analysis of its components must therefore be taken only as affording indications or as means towards the successful cultivation of the plant, but not as affording specific information in particular cases.

The analysis of the plant, especially of the ashes left after burning, is equally or more incomplete. The ashes show a part, and only a fractional part, of the volume of nutriment that is taken from the soil. Again, the analysis necessarily only shows the constitution of the plant, or of the part of the plant at the particular time the analysis is made. But a plant during its growth varies greatly in constitution at different times, and in different parts of its structure. Analysis affords comparatively little information of the ceaseless interaction and combination of components which is going on in the living organism. How little, for instance, up to the present has it taught us of the action of "enzymes," or ferments, which play so large a part in the life-history of the plant. Until a great deal more is known on these and cognate matters, the use and application of manures must remain chiefly empirical.

There is, however, one way from which the cultivator may obtain much experience that will be of the greatest service to him. We allude to field or garden-experiments, on the importance of which Mr. HALL very properly insisted. The experiments carried out for so many years at Rothamsted by Sir JOHN LAWES and Sir HENRY GILBERT furnish object-lessons, the value of which is beyond all estimate. Experiments on the same general plan, modified according to circumstances, should be carried out on every farm and in every garden in the country. Were this done over a series of years, cultivators would soon put themselves in possession of facts the due consideration of which would prevent the wasteful, haphazard, and irrational use of manures, natural and artificial, which prevails at the present time, alike in the farm and in the garden.

** OUR ALMANAC.—According to our usual practice we shall shortly issue a *Gardeners' Chronicle Almanac* for the Year 1899. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and allied Societies, or any of our correspondents, will send us immediate intimation of all fixtures for the coming year.

CHAMÆROPS EXCELSA.—In our present issue we give, as a Supplement, a representation of a fine specimen of this Palm in the garden of Dr. HAMILTON RAMSAY, of Torquay. In our number for Nov. 26, we gave an account, with an illustration, of this remarkable garden, of which the Palm above cited is a remarkable feature. The photograph from which our illustration was taken was one of those executed by Mr. F. KITTO, of Torquay, for presentation to the Princess of WALES.

ROYAL HORTICULTURAL SOCIETY.—The last meeting this year of the Royal Horticultural Society will take place next Tuesday, the 13th inst., in the Drill Hall, James Street, Westminster, when the Fruit, Floral, and Orchid Committees will meet as usual at 12 o'clock, and the Scientific Committee at 4 P.M. A lecture on "Some of the Plants Exhibited" will be given at 3 o'clock by the Rev. Prof. GEO. HENSLOW, M.A., V.M.H.

LINNEAN SOCIETY.—On the occasion of the evening meeting on Thursday, December 15, 1898, at 8 P.M., the following papers will be read:—1. "Sketch of the Zoology and Botany of the Altai Mountains," by Mr. H. J. ELWES, F.R.S., F.L.S., &c.; 2. "A Description of some Marine and Freshwater Crustacea from Franz Josef Land, collected by W. L. BRUCE of the Jackson-Harmsworth Expedition," by Mr. THOS. SCOTT, F.L.S., &c.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, December 12, 1898, when a paper will be read by Mr. WM. WEAVER (Fellow), entitled "The London Building Act and the Official Supervision of Buildings." The chair will be taken at 8 o'clock.

"BOTANICAL MAGAZINE."—The December number of this venerable publication contains coloured figures of the following plants:—

Musa Bakeri, Hook. f., t. 7627.—A newly-introduced plant, supposed to be a native of Cochin China. It has the habit of *M. sapientum*, but has a shorter spike, and the bracts are of a deep rose-pink colour. Kew.

Cardamine latifolia, Vahl, t. 7628.—A Pyrenean species, greatly resembling our common Lady's Smock, *C. pratensis*, but larger in all its parts. Kew.

Parhipedilum Mastersianum, Hook. f., t. 7629.—This is better known under the name *Cypripedium*, and for garden purposes it may still be retained under that genus. It is, says Sir JOSEPH HOOKER, "a noble species, named in compliment to Dr. MASTERS, F.R.S., through whose exertions, following those of his predece or, Dr. LINDLEY, the *Gardeners' Chronicle* has done more to extend a knowledge of the Orchidæ than any other periodical."

Caladenia carnea, R. Brown, t. 7630.—An Australian terrestrial species, with a linear, hairy leaf, and erect spikes from each tuber. The sepals and petals are linear, white, or in some varieties rose-coloured; lip much shorter, concave, arcuate, with a row of tubercles on either side of the centre. Kew.

Fritillaria pluriflora, Torrey, t. 7631.—A Californian species, differing from the ordinary species in the very short tubular portion of the perianth, and in the spreading stellate limb. The sepals and petals are rose-pink in colour, with a purplish pit at the base of each. There is no tessellation on the flower, which is so unlike that of *Fritillarias* in general as to warrant its being placed in a separate genus.

NATIONAL DAHLIA SOCIETY.—The annual meeting of the National Dahlia Society will be held, by kind permission of the Horticultural Club, in their rooms at the Hotel Windsor, Victoria Street, S.W., on Tuesday, December 13, 1898, at 2 P.M.

"KEW BULLETIN."—Appendix 1 (dated 1899), comprises a list of seeds of hardy herbaceous annual

CHAMÆROPS EXCELSA IN DR. HAMILTON RAMSAY'S GARDEN, TORQUAY.

and perennial plants, and of hardy trees and shrubs, which have been collected at Kew in 1898. They are not sold to the public, but are available for exchange with other botanical establishments.

TO ADVERTISERS.—In common with householders generally, we are in the habit of receiving circulars in numbers too large to be worth the trouble of counting. For the most part these documents are immediately consigned to the waste-paper basket, so that all the trouble and expense connected with their transmission is wasted. How very much more sensible it would be to advertise in an appropriate manner in suitable journals—such, for instance, as the *Gardeners' Chronicle*!

ROSA GIGANTEA AT CAPETOWN.—We learn from a correspondent at the Cape that *Rosa gigantea* has flowered this year in the garden of Mr. ARDERNE, Claremont, Capetown. It is a four-year-old plant, which has never been pruned. This is the second recorded instance of the flowering of this grand Burmese Rose under cultivation.

THE LYONS ROSE CONGRESS.—We have already had occasion to note the doings of this Congress, held at Lyons on September 2 last, when Mr. ARTHUR WILLIAM PAUL, of Waltham Cross, attended as a representative of British rosarians, and was, with other foreign Rose-lovers, elected a Vice-President of the Congress. The *Bulletin of the French Society of Rosarians* for October contains a full account of the proceedings.

EXAMINATION IN HORTICULTURE.—The next examination will take place in April, 1899. Medals and certificates will be granted to deserving candidates. Scholarships are offered to male students between the ages of eighteen and twenty-two years. The successful candidates must study in the gardens of the Royal Horticultural Society at Chiswick for one year, and conform to the general rules laid down for the guidance of students. The students who have gained scholarships in former years are Messrs. W. N. SANDS, G. F. TINLEY, and H. S. LANGFORD. Intending candidates should apply for further information to the Secretary, Royal Horticultural Society, 117, Victoria Street, Westminster, S.W., enclosing a stamped and directed envelope.

CHRYSANTHEMUMS AT ANTWERP.—At the recent Antwerp Chrysanthemum show, M. HENRI VANDERLINDEN and L. BERKELAERS staged, the former a hundred, the latter eighty plants, of an average height of 2½ feet. M. VANDERLINDEN showed plants grown for more than a year in tubs, as are Oranges; among them were Calvat's Australian Gold, Fée de Champsaur, with fifty blooms; Mme. X. Rey, with eighty flowers; Mme. Gustave Henry, 7 feet across, with eleven flowers. Plants raised from one-year cuttings included L'Isère with eight flowers; Edwin Molyneux, with thirty-two flowers; Mrs. Harman Payne, with thirteen large flowers; Beauté Grenobloise, with twelve fine blooms; M. H. de la Blanchetais, with twenty flowers; Ma Perfection, with ten blooms; W. H. Lincoln, with twenty-two flowers. Among M. BERKELAER'S exhibit were Géant de Bellecour, with seven flowers; Souvenir de Petite Amie, with eleven flowers; Souvenir de Jambon, with twelve large flowers; Fée de Champsaur, with eleven flowers; Souvenir de Molins, with seventeen very fine flowers; M. Edm. Roger, with twelve large flowers; Mme. Rozain, with five flowers; Colonel Trevor Clarke, and Charles Davis, each with fifteen flowers; and W. H. Lincoln.

"SYMBOLÆ ANTILLANÆ."—Under this title, which we may translate as "Contributions to the Flora of the West Indies," Dr. URBAN of Berlin has issued, as a preliminary chapter, a full bibliography of his subject. This occupies nearly 200 pages. It comprises an alphabetical list of all authors who have published books or memoirs on the Botany of the West Indies. At the end of this list an enumeration of the works pertaining to the several islands is given, from which we find that some sixteen memoirs or books are devoted to West Indian Orchids, four to

Conifers, five to Palms, thirty-six to Ferns, and so on. The work may be had from WILLIAMS & NOR-GATE, Henrietta Street, Covent Garden.

USELESS SYNONYMY.—A French Rose-grower states that Rose Mrs. John Laing (pale form) has been sold in England under the name of "Mrs. W. Sanford," and of "Pride of the Walley." Albion may be perfidious more or less, but we venture to think no son of Albion has sent out a Rose as Pride of the Walley!

M. NABONNAND.—Each year the French Rose Society awards a medal to some distinguished rosarian. This year the medal has been bestowed upon M. NABONNAND, of Golfe Joan.

ROSES.—The *Deutsche Gärtner Zeitung* of Erfurt publishes a Rose novelty number (*Rosen-Neuheiten Nummer*), containing figures of H.T. Father Lambert, H.T. Grand Duke Adolf of Luxemburg, H.T. Frau Geheimrath von Boch, H. T. White Maman Cochet, and H. T. Ferdinand Jamin, and H. T. Grüss an Teplitz.

PROFESSOR GIBELLI.—Italian papers announce the sudden death of Professor GIBELLI, of Turin, an enthusiastic Italian botanist, and the author, among other works, of the very useful *Illustrated Flora of Italy*.

NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION), AND NATIONAL AURICULA AND PRIMULA SOCIETY (SOUTHERN SECTION).—The annual general meeting of the above societies will be held in the room of the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Wednesday, December 14, 1898, at 7 P.M. Members of committees are invited to meet at 6.30 P.M. on the same day, and at the same place.

HORTICULTURAL CLUB.—The usual monthly dinner and *conversazione* will take place on Tuesday, December 13, at 6 P.M. The subject for discussion will be "Size in Flowers, Fruit, and Vegetables," to be opened by the Rev. W. WILKS.

THE PREMIER BLOOM at the November show of the National Chrysanthemum Society was one of G. J. Warren, exhibited by Mr. F. VALLIS, Bromham Fruit Co., Bromham, near Chippenham. It was to this gentleman that Mr. SIMPSON'S prize of a painting of the bloom was presented on the occasion of the annual dinner reported in our last issue.

PERSIMMONS (see p. 406).—We are informed that the greater part of the fruit in the market came not from the Canary Islands, but from the south of France. The fruits are known in the markets as "Kaki." For once the popular and the botanical name are in accord, for the fruits are the produce of *Diospyros kaki*, numerous varieties of which are cultivated in Japan, from which country they have been introduced to the warmer parts of Europe. We have often had occasion to mention the fruit, for its beauty and for its delicious flavour when properly "bletted." If one is incautious enough to try the fruit before it is bletted, he will not be disposed to repeat the experiment. The tree is now to be found in many orchard-houses, and as we noted the other day, Canon ELLACOMBE succeeds in fruiting the tree in the open air almost every year.

THE ISLINGTON CATTLE SHOW.—For a period of 100 years the Smithfield Club has held an annual exhibition of cattle and sheep, &c., in London, and for the greater part of this time the *Gardeners' Chronicle* has attended its gatherings. Not that we are specialists in fat beasts, but we cannot profess other than the liveliest interest in agriculture, it being so closely allied to our own particular art that it would be very difficult to divide them by a line. Ours is garden culture, as differentiated from field culture; but as the years pass, it is observed that a greater proportion of the agricultural land in England is being subjected to methods very nearly akin to gardening. This approximate identity of the two arts is very apparent upon an inspection of the Islington show. The various seedsmen have stands

in the galleries that primarily set forth their specialties for the agriculturist; but there are many roots and other vegetables, and even fruits, that are very interesting to the gardener. As gardeners, we cultivate Potatoes, Carrots, Parsnips, Turnips, Onions, Kale, and hardy fruits. The farmer does the same thing, but he grows them under a system of field culture. The farmer, of course, in addition to all this, cultivates the various grains and roots for human consumption and for cattle, and, as the show very vividly demonstrates, he rears "fat beasts." On this occasion Messrs. J. Carter & Co., High Holborn, London, had a very imposing stand, that displayed huge roots of their Mammoth Long Red and Windsor Prizetaker Mangels, Goldfinder Swede, several standard varieties of Onions and Potatoes, and their Hundred Fold, Stand-up, and Prize Red Wheat. In a few boxes also were lawn-grasses, just raised from the firm's seed. The exhibit from Messrs. Sutton & Sons, Reading, was as fine as usual. In the centre was a display of various medals and honours that the firm had won. Their Golden Tankard Mangel, specially recommended for dairy cows; their Prize-winner and Mammoth Mangels, and Magnum Bonum and Crimson King Swedes were represented by large numbers of very large yet even roots. There were also Kohl Rabi, Carrots, and Potatoes, including of the latter such fine varieties as Satisfaction, Magnum Bonum, Windsor Castle, Ninety Fold, Flourball, and the new variety Ideal. Dried specimens of pasture grasses and an assortment of the best varieties of the grain could be noticed also in this exhibit. The Stourbridge firm, Messrs. Webb & Son, was much to the fore, their exhibit being of very noticeable character. Again were noticed mammoth roots of the firm's Mangels, Swedes, and Turnips, the specimens of Yellow Globe Mangels being particularly colossal. There were good samples of Potatoes also in some well-known and prized varieties. Messrs. Harrison & Sons, Leicester, showed lesser-sized roots, selected with much regard to evenness and quality; they had a larger quantity of Potatoes than some of the exhibitors, and the Intermediate and other Carrots were very fine. "Dicksons," Chester, contented themselves with a smaller exhibit, chiefly displaying dried grasses and seeds of same. There were two exhibits from Coggeshall, in Essex, one from Messrs. E. W. King & Co., and the other from Mr. Jno. K. King. The Surrey Seed Co., Redhill, Mr. Alex. Blatchford, Coventry, Messrs. Jarman & Co., Ltd., Chard, Somerset, had also stands containing interesting exhibits. Potatoes were the special features of Messrs. Fidler & Sons, Reading, and Mr. A. Findlay, of Markinch, N.B., both of which firms have introduced to commerce many fine varieties. Mr. B. Wells, Crawley, had a few hardy fruits; and a nice exhibit of Apples was made by Messrs. W. & J. Brown, Peterborough and Stamford, the firm, it will be remembered, which introduced into commerce the remarkable and handsome Peasgood's Nonsuch, and Barnack Beauty. It was this firm, too, that first exhibited Allington Pippin before the R.H.S., when, as South Lincoln Pippin, it was certificated by the Society. Another exhibit of fruits was one from Mr. W. Horne, Cliffe, Rochester, who had several good varieties in fine condition.

The show of implements was extensive, and worthy the inspection of all connected with agricultural, horticultural, or dairy work. It is important to an economical system of cultivation, that use be made of the improved appliances that science and mechanical skill have provided. The Queensland Government had a stand where cheese, very good butter, and grain, &c., grown in and exported from that vigorous colony could be inspected. We were told that the problem the colony has to solve is still that of labour, and the Government has great need of agricultural (skilled) labourers, and gardeners to assist in the development of the resources of this sun-favoured country. A great number of miscellaneous but instructive exhibits we are quite unable to mention here, and we can only in conclusion remark that the prime beast in the show was a magnificent black-polled Angus exhibited by Lord Strathmore, Glamis Castle, N.B., a Scottish seat that has long been famed for the horticulture that is encouraged there.

THE PRINCIPLES AND PRACTICE OF BULB-GROWING.

(Continued from p. 361.)

AFTER flowering, the bulbs should be permitted to remain in the ground until the cycle of their vital activity has drawn to a close, i.e., when the foliage has withered, and no fresh leaves are produced. It would be the greatest error to disturb the bulbs before the leaves had thus gradually decayed, for the latter constitute the manufacturing department of the plant, where, through the sunny days of spring or summer, all the various substances which go to build up the bulb, and the potential energy for its blossoming and leaf-formation the following year, are developed, such as the sugars, proteids, salts, and the chemical matters which yield the exquisite scent and colours of the flower. And all this must continue to its natural close; for if the bulbs were taken up while the leaves are still green, and therefore still active, the latter would be injured and destroyed through lack of the water taken up by the roots, the active assimilation and storage of nutriment would be interrupted, and the flowering capacity of the bulb for next year greatly weakened. The flowers, of course, greatly exhaust the bulb, being produced at great cost to the latter. But in Nature, in the interval between each successive flowering, the leaves are usually long at work, increasing at such time in size and vigour, and building up the bulb again, or the young ones produced therefrom. In most bulbous plants the foliage either accompanies or immediately succeeds the flower. The Meadow Saffron, however, is a conspicuous instance of a plant in which the flowers and leaves appear at two distinct seasons of the year, the former in the autumn, the latter in the spring. This plant was, probably, at one time a spring-bloomer, for vernal flowers, though greenish and weakly, are still occasionally produced, the present habit having been acquired most likely as a result of the too great competition and struggle for life which took place amongst the flowers of the spring. The Dutch growers usually cut off the flowers of their bulbs as soon as they have reached perfection, not allowing them to set seed, or even to show the slightest indication of the ripening of the ovary. In this way a great deal of the energy expended by the plant under a state of nature for the sustenance of the flower and the production of seed, is saved to the bulb under cultivation, with the result that it increases in quality and capacity for throwing up large and well-formed blooms; but after the leaves have died down, care should be had not to leave the bulbs any longer in the ground than is necessary, for in a few weeks they would begin to put forth roots, and form young bulbs for next year, and if they were then to be interrupted in this work by removal from the ground, their flowering capacity and vigour for next year would be lessened.

THE PROPAGATION OF BULBS.

This is a most important and interesting question both for the horticulturist and the botanist; and the history of the mode in which these plants are reproduced, is perhaps the most delightful phase of their delightful and absorbing life-history.

They may be multiplied by seed, but this is for the most part a long and tedious process, and usually only employed in the case of raising hybrids. Too many years elapse before the bulb is mature enough for flowering, and the patience of the cultivator becomes, consequently,

exhausted. The Hyacinth, e.g., demands a youthful immature career of some five or six years before it can feel energy and power, and ripeness enough to throw up a flowering-spike. Some of the smaller bulbs, however, are frequently grown from seed, such as the Snow-drop and Squill, for these do not take so many years to mature their bulbs for flowering. The majority, however, such as Hyacinths, Tulips, Narcissi, Crocus, and Gladiolus, are propagated vegetatively, and that by a method of stem-branching as described in an earlier paragraph of this article. The young bulbs are formed laterally, often in great numbers all round the parent in the axils of the scales of the latter; in the typical bulb. In the Gladiolus and Crocus, when the foliar organs or scales do not constitute the "bulb," the young corm is necessarily produced as a lateral branch in the axil of a scale-leaf at the top of the parent-corm, for in that region is situated the growing point. The young corm then gradually replaces the old one below, which dies.

When the bulbs are taken up in the spring or early summer for housing, the young bulbs are all removed and reserved for planting in separate beds the following autumn, thus freeing the old bulb from the encumbrance of their support, and enabling it when replanted to concentrate its vital energies on its own growth and maturation. *W. C. Worsdell.*

(To be continued.)

MESEMBRYANTHEMUM CULTURE.

THE culture of Mesembryanthemums, or Midday Flowers, Ice-plants, or by what other names they are termed in the vernacular, is undeservedly neglected at the present day; and yet the genus is rich in grotesque forms, and rich and unusual colour of the flower, which in many instances are very freely produced. There is also as great a variety in the forms of the leaves. The cultivation demanded is very simple, and many of the species, being natives of warm temperate climates, such as South Africa, Australia, New Zealand, the Canaries, and countries bordering on the Mediterranean, need only cold greenhouse treatment during half the year, and to be set out-of-doors in a sunny position in the summer and early autumn. Several species make charming window-plants. Propagation may be effected by division, the pieces being laid on a moist sand-bed in the full sun in the spring, rooting taking place in a few weeks.

Mr. Kurt Marquardt, writing in the *Wiener Illustrierte Garten Zeitung* for October, advises the raising of plants from seed. The plants are very prolific of seeds. These seeds should be sown in February in pans filled with sandy soil, and only lightly covered, and the pans set in a warm house till germination has taken place. Instead of leaving the cuttings or divisions to root on the surface of a moist sand-bed, with a bottom-heat of 75°, he places them in an airy place till the wounds are dried, as in the method with Cacti, and then dabbles them out very shallow in pans, and sets these in a luke-warm bed. The cuttings soon form roots, and they are then potted singly, and for the first year cultivated in a mild dung-bed. The cuttings or seedlings, when potted, must be kept close for several days till roots begin to form again; shade from strong sunshine being afforded, afterwards accustoming them to full daylight and full ventilation by degrees.

From October onwards the plants should be accommodated on a greenhouse shelf, close to the glass, and kept quite dry at the root till the middle of the month of February. When growth again begins, the plants should be repotted, always giving small shifts, never large ones, and late in May placed out-of-doors, or, at the most, afforded the protection of a cold frame till June. Mesembryanthemums prefer a sandy, loamy soil and good drainage, consisting of very small crocks overlying a layer of coney crocks

at the bottom of the pan or pot. In summer, water should be frequently afforded. The plants are much benefited by light showers, and on warm sultry evenings by syringing with water. On the other hand, long-continued rain is frequently a cause of stem-rotting, and, therefore, it is advisable to have the necessary means at hand to protect them against excessive wet.

When the plants have reached a desirable size, it is no longer advisable to afford them an annual repotting. We may mention *M. albidum*, an ever-green species, growing 6 inches high, with golden-yellow flowers pleasantly scented, appearing June to August; *M. aurantiacum*, orange-coloured flowers, with very glaucous, bluntly triquetrous leaves, stems erect, height 2 feet—June to August; *M. blandum*, flowers at first white, changing to red, leaves smooth and narrow, stems ascending, height 1 foot—June; *M. Cooperi*, a beautiful purple flower, solitary, about 2 inches in diameter, leaves terete and glaucous—a much-branched spreading herb; *M. cordifolium* and *M. crystallinum* are known to every one, the first as a carpet-bed plant, and the second as a rock plant in hot dry places, where scarcely anything else would grow, and associated with eating as a "garnishing" plant; *M. deltoides* has rose-coloured flowers, appearing in cymes, sweet-scented, an erect shrubby species, with red-brown branches; *M. floribundum*, with pale-red flowers, the petals having a white base; leaves nearly cylindrical, branches spreading and numerous—May to October. *M. spectabile*, a fine red flower, 2 inches in diameter; leaves glaucous, stems dwarf floriferous ones, ascending, height 1 foot; floriferous May to August. *M. violaceum* has flowers that vary in colour from blush to violet; peduncles one flowered, leaves partly terete, glaucous, height 1 to 2 feet. The species are numerous, and but few are obtainable at our nurseries.

HOME CORRESPONDENCE.

FILBERTS AND COBS.—A number of nut-bushes is desirable in all south-country gardens, and they succeed wherever the common Hazel thrives in the hedge-rows. The best kind of soil in which to grow them is a good deep light loam, and the aspect sunny, although I have seen very heavy crops in Kent taken from trees growing in a somewhat shaded part of a garden. The bushes should stand 12 to 14 feet apart, possess clean stems 18 inches high to the lowest branches. The common method of training them is that known as "basin," and to give them this shape three to five young shoots at the proper height from the ground and at equal distances apart, should be selected, staking these outwards, and always keeping the middle open. Where large numbers of bushes are grown, a skilled pruner will in a few years build up good specimens 6 to 7 feet high without staking. The chief points to observe after the bushes are started in the proper form are to keep suckers in check, and to remove coarse shoots, and encourage fruitful twigs. The principal pruning should not take place before the month of March—a little earlier or later according to character of the season. There are various methods of storing the nuts, so as to keep the kernels sound and sweet for a good length of time. Some cultivators store them in jars, sprinkling a little salt over them, and others expose them to sulphur fumes to prevent the husks becoming mouldy, and then store them in a cool, dry place. But the most successful way that I have practiced is to gather the fruit when fairly ripe, and keep them in a dry place for a few days, turning them over occasionally, and then to place them in tubs lined with dry straw and cover them, and stand the tubs in a somewhat damp place. In this way I have kept the fruit plump and sweet for nine months—Filberts being smaller and earlier than Cobs, should be used first, and need no storing. The Kentish Cob is the variety mostly grown for market purposes, it is a sure cropper, producing large bunches, and is a heavy bearer; while the true Kentish Filbert is the best flavoured, and Filbert Prolific the heavier cropper of the two of the Filberts. *H. Markham, Margate.*

A DWARF-STEMMED MUSA.—In the *Gardeners' Chronicle*, October 29, in the report of the Fruit Committee, mention is made of a dwarf fruiting form

of M. Cavendishi, the plant fruiting at a height of 5 feet. The Committee wished to see it again, there being a possibility that the plant had prematurely fruited on this occasion. It may, therefore, be of interest to many if I state that such a variety has been in cultivation during ten years at least; in the autumn of 1887, when I took charge of the gardens here, a small stunted-looking plant of *Musa* came here amongst a lot of other plants. At the time, I was told that this was a variety that did not fruit. The plant was grown amongst a mixed collection of stove plants, and in due course it produced rather a small bunch, but the individual fruits (or beans as called here) were large and of excellent flavour. Some suckers were detached and potted, which grew freely, and fruited in about fifteen months, producing splendid bunches of fruit in every way. We have ever since grown a number of plants each year which fruit freely, and produce large clusters of fruit. Now not a single plant grown during the last ten years has exceeded $4\frac{1}{2}$ feet in height. I have just measured carefully three of our largest plants to-day, and give the correct dimensions. The first plant measured 3 feet 9 inches from surface of soil to stalk of fruit; the other two plants, exactly 4 feet each; leaves 4 feet 9 inches long by 2 feet 6 inches broad. I think this conclusively proves that Mr. Wythes' plant did not fruit prematurely as supposed. The plants at Stoke Park are grown in different houses, and all of them in tubs, and are used occasionally for house decoration; those grown in the large Palm-house being generally the tallest to fruit. As regards the question in what length of time a plant will be productive of fruit: a good deal, in my opinion, depends upon the dimensions and age of the suckers when severed from the parent plant, large suckers being also older, fruiting much quicker than small ones. Some plants I have simply cut down after the last fruits on a bunch have ripened, and allowed the strongest sucker to grow away in the same tub, merely affording a top-dressing of artificial manure. Such suckers fruit at less than twelve months old. I have often wondered, when seeing very tall plants in some gardens, why such were grown, when much dwarfer plants are obtainable. There is no difficulty whatever in fruiting plants in twelve months from the time the suckers are first potted. As a rule, our largest suckers have roots when separated from the mother plant, and they are potted in 10 and 12-inch pots according to the size, being transferred to tubs made of paraffin casks cut in two. Such tubs last for years, and by painting the wood light green and the hoops black, they look very neat. No plants are less troublesome to cultivate than *Musas*, provided the soil is rich, and they are well supplied with moisture at the roots and in the atmosphere, and a temperature such as suit *Crotons* is afforded. Insects give no trouble whatever. *D. Kemp, Stoke Park Gardens, Slough.*

THE PURPLE BEECH.—For some years a considerable section of the Press and society have been raising a hue-and-cry against coloured and variegated trees, shrubs, herbaceous or evergreen plants. And the cry went a long way in arresting the planting of Purple Beeches. The controversy brought to the front, however, not a few powerful advocates of the other side of the question. Notable among the latter was the late Chief Baron Pollock, who largely furnished his well-stored garden with coloured variegated-leaved plants. His opinion, which I heard from his own lips, was that purple, gold, silver, in a word, most, or all, variegated plants, were not only more beautiful, but more perfect than green ones! Certain vegetable physiologists and natural philosophers hold that [some] variegated and extra coloured plants are weaker, that is, less finished than green. Thus, variegation is a proof of weakness, not strength, and results from something undeveloped, rather than anything added to, the leaves and branches. On the other side, the late Lord Chief Baron held that variegation was another step towards higher evolution and more perfect development of plant life. Be that, however, as it may, few who were privileged to hear this learned lawyer discourse on the merits and beauties of variegated plants, or saw him enjoying his learned leisure among them, would be likely to forget your admirable illustration of Miss Sullivan's Copper Beech in a recent issue of the *Gardeners' Chronicle*, which ought to give a powerful fillip to the planting of this variety in parks and pleasure-grounds. At first sight there seem to be or to have been two giant Purple Beeches at Fulham. Or can this be the late Bishop of London's tree under new proprietorship? [No.] It is some years since I made a pilgrimage to Fulham to see the Bishop's Purple Beech. It was then one of the finest in the kingdom. Another very

fine one as regards symmetry, size, and colour, stands on the lawn at Hardwick House, Bury St. Edmund's. The third notable specimen also visited by the writer some years since was at Enville, noted by you last week. I had the pleasure of seeing some notable Beech and other fine trees some years ago in company with the late James Barnes, then of Bicton, Devonshire. And he laid down as a law that no one could see a giant Beech, Cedar, or other tree in all its magnificence and stately grandeur unless he approached close to the stem and rubbed noses with the bole, and looked long, earnestly, silently through the branches. You have already told your readers in a sentence or two a few of the entrancing sights that will hold them spell-bound under Purple Beech if they will take the late James Barnes' or your advice. In planting Purple Beeches as garden, lawn, or park trees, it is important to select a good strain. There are several, such as Rivers' strain, larger, and darker than the normal types. The latter may be also greatly improved by careful selection. Only seeds from the deepest-coloured Copper or Purple Beech-trees should be chosen, and the best forms should be propagated by budding or grafting. Seedling Purple Beech should also be carefully selected; the greenest may be planted in woods and plantations for cover or for timber. By such means the percentage of fairly good Purple Beech may be raised in seedlings from 20 to 80 per cent. Will the fortunate growers of these purple giants say if they have noted their blushing into deeper purple foliage with their advance in years? Finally, what effect, if any, they have noted the age of the Purple Beech has in increasing the percentage of purple seedlings, and intensifying the colour of the foliage, and glowing, delicate coppery shootlets. *D. T. F.*

PROPAGATION OF AN ALOE BY LEAVES.—Every gardener knows from his own experience that a number of soft-leaved Dicotyledons may easily be propagated by their leaves (*Gloxinia*, *Begonia*, *Coleus*, &c.), but I doubt whether it has been often observed, that a monocotyledonous plant, except bulbous plants, can also be propagated in this way. When staying at La Mortola, I remarked one day a large rosette of a *Gasteria*, whose leaves were hanging downwards, not standing stiffly upright as usual. Pulling one of them a little, I had the separated leaf in my hand, the lowest part of it embracing the stem being completely rotten. This was the case with all the leaves, in number about a dozen. I was rather surprised to find that that part of the leaves, where the healthy part began, was somewhat swollen and emitting several yellow healthy roots. As I could not imagine for what purpose the leaves had produced the roots, I gave them to the gardener, who laughed when I told him to plant them in pots. Visiting those pots a fortnight later, I found at the bases of the leaves a large number of young plantlets, some having already their own roots, whilst other smaller ones, and a great number of buds were still supported by the parent leaf. Two weeks later each leaf could be planted out as a tuft of from ten to twenty young *Gasterias*, 4 inches high, surrounding a single leaf, measuring 14 inches. *Dinter, Salem, S. W. Africa.*

LAPAGERIA ROSEA.—*Lapageria rosea* and its varieties are reckoned among tender plants—at least, in most parts of this country; but still there are warm corners in many a garden where it might be cultivated in the open with a fair amount of success if a little care were bestowed in safeguarding the plant in times of hard frosts. Some years ago I raised a number of plants from seed, and not having sufficient space in the greenhouse for all of them, I determined to risk some outdoors. The plants had been nursed in a cold frame, and were, in consequence, well prepared for putting out-of-doors. A narrow sheltered border was selected, but this I have since found is too restricted; the result is, however, surprisingly satisfactory. These plants have passed through two winters unharmed, with only the protection of a curtain of Frigi domo. Last spring the east wind blew for weeks continuously, and the temperature was often at or below the freezing-point night and day, yet these *Lapagerias* were unharmed, and by the middle of June they had made growths 3 to 4 feet in length, and that, too, at a time when hardy vegetation had been almost at a standstill for several weeks. During the past three weeks we have had most variable weather, and for three days, at the least, a black London fog enveloped the district; and to-day (December 1) I am enabled to send you bunches of flowers which will compare favourably with those cut from a plant growing in our greenhouse. [Excellent blossoms, in clusters, those from the out-of-doors plants being slightly deeper in

tint than the others. Ed.] The seed-vessels that I send grew on an out-of-doors plant. On plants grown under glass a seed-vessel requires fully twelve months to ripen, reckoning from the date when the bloom is fertilised. *R. B. L., Dulwich.*

CHRYSANTHEMUM-RUST.—It is a good thing the above pest has not yet become a general disease among "Mum" growers; there are some, I believe, quite unacquainted with it. I may say that I never saw such a pest for disfiguring the foliage of any plants. My advice to those who are plagued with it is to do away with their affected plants, and procure clean stock from a large grower or nurseryman, and during the summer to grow the plants on a fresh site, where *Chrysanthemums* have not stood before, and see that the site is a well-drained one, as anything in the way of stagnation encourages the disease. *A. J. L., Wyfold Court.*

TIMELY PLANTING OF BULBS.—In a recent issue of the *Gardeners' Chronicle*, p. 388, the Rev. G. Engleheart criticises my note in that for Nov. 12, on the planting of Daffodils, Hyacinths, Spanish Iris, and Snowdrops out-of-doors. He says, "I must assert that the middle of November is altogether a bad and wrong time to plant these bulbs;" adding, "and my opinion would not be high of the knowledge or the prospects of the market-grower who would plant on any large scale at so late a date." It should be here stated that my article on this subject was sent to the *G. C.* office about the middle of October, and it may have been delayed in publication because the Editor considered the then dry state of the ground made bulb-planting a difficult matter. During the interval that elapsed between the time my "copy" reached the office and the date of its publication, and assuming this to be the fact, I think the Editor under the circumstances was fortunate in not printing the article earlier. It may interest Mr. Engleheart to learn that I have transplanted rows of Snowdrops in shrubby borders which had been taken from established clumps on the place in June, before the grass-like foliage had quite died down, with very satisfactory results, the bulbs having been dropped into holes made with a crowbar, the plantings extending to a total linear distance of about three miles. Acres of Daffodils being transplanted in the same place in "masses" among the trees at the same time as the Snowdrops, and with like results, the Daffodils having been dug up for the purpose in some of the estate woods. Thus it will be seen, that in the matter of bulb-planting, as in the case of many other things, success is often attained by following very different methods of procedure. No doubt the *modus operandi* practised by market gardeners, even in the matter of bulb-planting, differs a good deal from that followed by the eminent *Narcissus* hybridist, both having different objects in view, but on this account it does not necessarily follow that the former is wrong. Perhaps Mr. Engleheart may not be aware of the fact that, with the exception of Roman Hyacinths, Roman and paper-white *Narcissus*, bulbs for potting-up and planting out generally do not arrive in this country much before the end of September. Has your correspondent ever noticed the time the bulbs, which annually make such grand floral spring displays in the London parks are planted? These bulbs have been supplied by Messrs. James Carter & Co., High Holborn, London, for several years past, and the cultural instructions given in this eminent firm's admirable bulb list for the present year go to show that the several bulbs—Hyacinths, Daffodils, Snowdrops, &c.—should be planted from September to the end of November. Mr. T. W. Birkenshaw, who, like Mr. Engleheart has raised many good varieties of the *Narcissus*, and has had charge of a large and valuable collection of *Narcissus* at Toley Hall, Sheffield, remarks in his pamphlet, *The Narcissus or Daffodil* (p. 24), "The bulbs (Empress and Horsefield) should be potted about the middle of October, or earlier, if possible"—that is, as soon as properly-raturated bulbs can be obtained. On the front page of the *Gardeners' Chronicle* for November 19 and 26, Mr. W. Baylor Hartland and others call attention to their bulbs (including six choice varieties of the Daffodil), both firms being distinguished bulb "specialists." Mr. Engleheart says that at the time "Mr. Ward's notes appeared, my *Narcissus*-beds were being Dutch-hood," adding, "Extreme care was necessary not to damage the foliage, which was then breaking the surface." Let us hope his plants may not get damaged by frost. Your correspondent says, "No bulb deteriorates so speedily when out of ground as the Spanish Iris, which, he states, is best planted in August." I should like to know where bulbs of the

Spanish Iris can be obtained from in August. Last year I did not obtain my supply of these bulbs until the end of September, and this year they reached me ten days later. Do not the above facts go to show that your correspondent got a little "mixed" in his statements *re* bulb planting? H. W. Ward, Nov. 29.

A GREAT GRAPE CLASS.—The Shropshire Horticultural Society have, I believe, done much to encourage good Grape-growing, and, as stated in the issue of the *Gardeners' Chronicle* for December 3, p. 407, the Society offers £100 in the class for twelve bunches in six varieties next year. Such liberal prizes will doubtless induce many first-class cultivators to compete. I am pleased to observe a hope expressed that judges will be less influenced by mere size of bunch than by the size, finish, and colour of the berry. I also hope that each variety will have its proper value attached to it. It is most discouraging to exhibitors of even and good-sized bunches, good in berry, and highly finished, to find that the judges have been carried away by mere size of the bunches, and high quality scarcely recognised. Mere size in most kinds of fruit, flowers, and vegetables, certainly command a more ready sale in the market; but if the public are to benefit by exhibitions, a correct standard should be set up. It would be a great help to exhibitors and judges if a relative value were put on the leading varieties of Grapes, so that there would be a more uniform result from judges. I find some judges go in for quality and finish, other things such as size and form of bunch being equal; whilst others show a preference for large bunches—so that if two sets of judges were independently asked to judge the Grapes, one set would reverse the other's decisions. As an exhibitor of Grapes, I shall be glad to have the views of others on this subject. *Exhibitor.*

RED GLASS FOR PLANT-CULTURE.—I enclose cutting from the *Spalding Guardian*, a local weekly paper, in case you think fit to reproduce it for the opinion of your scientific readers. As everybody knows, when white light is split up by passing through a prism it is resolved into its component parts, viz., violet, indigo, blue, green, yellow, orange, and red, the red being the heating end of the solar spectrum. This gives some colour, if I may use the word, to the Frenchman's statement. Ruby glass is expensive, but I propose trying a cheap experiment, my plan being as follows: the glass on the inside of a small frame is coated with picture-varnish, the thinnest red-paper is stuck on to this, and another coat of varnish supplied—rough specimen enclosed. I am inclined to think that the experiment may fail, even supposing that the Frenchman's theory is correct, and for this reason the varnish may possibly interfere with the transmission of actinic rays, but I think it worth a trial. R. K. ("Gardeners, amateur and otherwise, will be interested in a discovery that has been made by Camille Flammarion, the French astronomer. He has found that plants grown in a red hothouse become in a given time four times as big as those exposed to ordinary sunlight. The poorest development—practically amounting to failure—was obtained under blue glass").

NEW AND RARE PLANTS.—*Phlomis cashmeriana* is now being distributed by Mr. Max Leichtlin, of Baden-Baden. It is a pink Himalayan Sage, figured by Royle on plate 75 of his *Himalayan Botany*, which it shares with *Salvia hians*. It should be a very pretty plant, and I am glad to add it to my collection, and hope to bloom it next summer. Another beautiful plant I have just received from the same source is *Adenophora Potanini*, a blue Campanulad of apparently most free-blooming qualities, judging from the woodcut in the *Semaine Horticole* three weeks ago. Also *Campanula betulifolia*, with creamy-white flowers quite new to me. W. E. Gumbleton.

RIVIERA NOTES.

I HAVE, thanks to you, found in the *Gardeners' Chronicle* of February 12 last, a note which has been of great use to me on the Mammoth or Limbless Cotton. I have some seed sent me from the Georgia Experimental Station, and have obtained a wonderful result, raising splendid plants, remarkably early and productive. A more wonderful result still was obtained at Tunis, where I sent some of the seed.

This year I have been experimenting in a new direction. I have had sent me from the Soudan, the

Congo, Madagascar, Brazil, and Mexico, some earth, and that tropical earth, under the Provence sun, has yielded me many plants; the greater part quite unknown to me, and some perhaps new to science. The experiment is not yet completed, and I am waiting until it is, before determining the plants, if they live through the winter.

We have had terrible storms the last few days on the Mediterranean, and on the shores. We have had east and west winds and rain unprecedented for twenty years. In the two months, October and November, we have had a rainfall of nearly 17 inches, nearly two-thirds of the average for the entire year. We have been literally swamped.

I hope soon to complete a small botanico-horticultural monograph on *Pittosporum*; trees and shrubs which are really splendid in this climate. It is also well suited to Cacti, as you may judge by the photograph sent herewith, which represents *Cereus Spachianus*; the flowers white, very large, nearly 10 inches across, and which perfume the surrounding air for nearly a thousand yards. C. Ndm., Antibes.

FLORISTS' FLOWERS.

CROWN AND TERMINAL-BUDS OF CHRYSANTHEMUMS.

M. E. CALVAT in a paper published in the *Journal de la Société Nationale d'Horticulture de France* for October, discourses on the method of obtaining the large flowers of Chrysanthemum. From this paper we extract the following:—

"In spite" says he "of all that has been said, and perhaps owing to a play on the word crown, many persons still confuse the crown-bud with the terminal-bud. Any bud is called a crown-bud which appears from the beginning of the season up to the first days of September. Only those which appear in August should be allowed to flower; before that month they should be relentlessly suppressed, and one or many of the stems which accompany them, prolonged to the following bud. The first bud which appears is that which marks the first ramification of the plant.

In addition to the season at which it appears, the crown-bud is also recognisable by the peculiarity, that it is always surrounded by leaf-buds or shoots arranged in a crown around it.

The terminal-bud is also surrounded with a crown of buds, but in this case of flower-buds. The crown-bud, when it has been isolated for some time, may be known at first sight by the long stalk, sometimes too long, and clothed with leaves which supports it. This bud is the one usually chosen for developing large flowers in the Japanese, Japanese incurved, and reflexed varieties.

The terminal-bud makes its appearance about the beginning of September; it may be easily recognised, as it is surrounded, not like its forerunner by leaf-shoots, but by flower-buds. Thus, while the crown-bud is isolated by suppressing the leaf-buds which surround it, the terminal bud is isolated by removing the flower-buds which accompany it.

If the epithet of "crown" is more or less justified, the term "terminal" is much more so. It is, in fact, the bud which terminates the stem of the plant; it is the highest in position, although the last to be developed, and after its production, no further growth, either floral or leafy, takes place. [We have suggested the use of the word "final" for this bud, to prevent further confusion. ED.] Unlike the other, the terminal bud has its stem furnished along its whole length with leaves; it is the bud to be encouraged in the tubular, incurved and heavy varieties.

We must, therefore, adopt a general rule, leaving each cultivator to decide which of the crown-buds (developed at the beginning or end of August) is most suited for this or that variety. The rule is in central France not to take [that is, reserve or isolate] the crown-bud before August 10, in other words, that all those are taken which appear after that date. In thus acting all is done for the best, whatever happens.

In the north of France and England the crown-bud may be "taken" from August 5; in the south it may be deferred until August 15.

While thus establishing a general rule for the majority of varieties, it should be noted that for Madame Carnot it is as well, in an ordinary season, not to begin to take the bud before August 20; and the same rule applies to Mdlle. Lucie Faure, C. Harman Payne, M. B. Verlot, President Nonin, &c. As an exception, Madame Ed. Rey, on the contrary, yields good flowers on buds taken after August 1; while Calvat's Australian Gold, Madame Fossier, Madame Ricoud, Le colosse Grenoblois, Marie Calvat, &c., are no exception to the above rule.

ZONAL PELARGONIUMS.

On p. 333, Nov. 5, there appeared a note by "A. D." in praise of the zonal Pelargonium for blooming during autumn and winter. Probably many who visited the November and December shows of the National Chrysanthemum Society at the Royal Aquarium saw ample demonstration of the extraordinary brilliancy of colour these flowers afford, beside which the Chrysanthemum paled very considerably. I do not intend to dwell longer, however, in contending for an established fact, but, rather to give a selection of the most effective varieties that was made recently when I had the pleasure to inspect the collections of Mr. T. B. Haywood at Woodhatch Lodge, and of Messrs. H. Cannell & Son, Swanley.

Taking the singles first, there appeared to be little to choose for scarlets between Charles Maison, W. E. Cordon (new), and Lord Aberdeen. Very effective white varieties are Niagara, Snowdrop, and Dr. Nansen, all of these being of good size, but differing very slightly in purity of colour and symmetry of form. Lovely pinks are Gertrude Pearson and Countess of Buckingham. The former is especially meritorious, and is not a novelty; the white centre is a point of great attraction. The best orange-coloured varieties were Wordsworth and A. H. Arderne, and the most perfect purples Lord Reay (new) and Sir Jas. Kitson. Then, in Nicholas II. we get a very fine variety with scarlet flowers, shaded purple. King of Crimson is the best representative crimson-flowered variety. Of salmons there are many good and distinct varieties, which differ considerably in the degree of colour and in the markings. The best were Mrs. P. Routh, Kate Farmer, and Inverness. Beauty of Kent (pink and white) and Lilacinum (lilac-pink) should be included also; and I might have added an additional scarlet in Countess de Morella (new). This is a very effective variety, and has a distinct, striking white eye. The greatest novelty in the singles at Swanley was an unnamed seedling, scarlet, with white eye. The flowers noticed were 2½ inches across, and it will be much the largest bloomer in this section, and its form is excellent. It was, I believe, proposed to call it The Sirdar.

The double-flowered varieties, though very useful as cut flowers, do not, as a rule, bloom so freely, or make so grand a show upon the plants. Raspail Improved, Double Jacoby, Beauté Poitevine (salmon), Lord Derby (pink), René Bazin (salmon), The Pearl, and Boule de Neige (both white), and many others, are very useful.

But in this semi-double section, the most attractive and novel are the double whites, with picotee margins to the pips; Madame Alcide Bruneau, pure white, edged with magenta; and Fraicheur, creamy-white, with deep pink or rose margins, are really beautiful.

Many gardeners fail in blooming Pelargoniums successfully in the winter because they do not possess a suitable structure in which to house the plants after the summer is past. The plants may be grown well during the summer, and by proper pinching and full exposure, a shrubby and short-jointed habit of growth obtained; but they must be given a perfectly light and pleasantly warm structure when about to bloom. Nothing is more suitable than a little span-roofed house where they may be stood upon stages, not far distant from the glass, and where the temperature, ventilation, &c., may be regulated with regard to the needs of the Pelargoniums alone. Any excess of humidity in the atmosphere of the house, or a long continuance of stagnant air even, will be injurious,

and if the Pelargoniums be shaded by or huddled together with other plants in an ordinary greenhouse, they will fail completely. It is well also to cease pinching the plants in September at the latest, that they may make the necessary after-growth before lessened light and shorter days occur to make the growth weak. Nevertheless, the time of blooming must be greatly dependent upon the date at which the pinching be discontinued. P.

CHRYSANTHEMUMS.

The Season's Novelties.—The introduction of improved varieties is one cause of the immense interest taken in the Chrysanthemum. Any variety that shows improvement in form, colour, or general usefulness, is sure of a welcome. Now that English-grown seed is so easily obtained, it has become quite common for cultivators generally to turn their

build. The evenly-grown florets are lance-shaped. The colour is a mixture of coppery-red and gold, and is pleasing. The habit of growth is good, being from 4 to 5 feet in height.

Melusine is another of the same set. The blooms in their general formation are somewhat similar to those of Viviani Morel. The colour is distinct, being rosy-white, flushed with purple on the surface.

Soleil d'Octobre is a gem for early November flowering. Like many other varieties, the whole character of the flower may be altered by culture. Blooms developed from ordinary crown-buds are furnished with broad lance-shaped, beautiful florets. When a too-early-formed bud is selected, the florets become narrow, irregular, and almost colourless; whereas the flower should be light-yellow-coloured.

Reginald Godfrey is an English-raised seedling, and promises to become a standard variety. In form it is

to be a favourite. The narrow old rose and yellow-coloured florets curl at the tips slightly.

Autumn Glory was raised by Messrs. Hill & Co. in America, and reminds one much of Etoile de Lyon in the shape of its florets and general build, also in the variation in colour occasioned by bud selection. If very early buds be selected they produce pale-coloured blooms. When seen in its best character it is desirable.

Chatsworth has flat florets, that incurve slightly at the tips; there are, however, enough of them to build up a full solid bloom, which all ought to obtain, as its distinct colouring is desirable in any collection—white flushed and striped with purple.

Latiana (Calvat) surely belongs to the Carnot family. In my opinion it too closely resembles G. J. Warren to be desirable; time will determine.

Joseph Brooks is margined and flushed with crimson on a bronze-yellow base, a semi-incurving variety.

President Nonin is one of the best of the incurved Japanese section; the florets are broad and massive when developed from the right bud, otherwise they are narrow and loose. In colour it is rich amber.

Duke of Wellington belongs to the same type; the brick-red or terra-cotta colour is plainly seen on the surface, as the florets do not incurve so closely as some. The reverse is salmon-buff.

N. C. S. Jubilee, although not quite new, deserves to be better known. The colour is rose-peach. This, coupled with its stout, closely incurving florets, makes it an attractive variety.

Robert Powell, shaded chestnut or terra-cotta, with gold reverse.

Beauty of Adelaide has rich rose-coloured, loosely incurving florets.

Milano is a rich terra-cotta-red, with lance-shaped florets.

Baron Adolphe de Rothschild was sent out by M. Calvat two years since, but has not been staged at its best yet. Although white-flowered varieties are numerous, this deserves attention, as when well grown it is one of the most massive blooms in existence. E. Molyneux.

RHODODENDRON GRAFTING.

THE usual species used for stocks are Rhododendron ponticum or R. catawbiense, although seedlings of any vigorous species or hybrids make good stocks for R. hybridum. The stocks should be three to four years old, and have been established in pots for one year. Grafting should begin in January, and may be extended to March, and in August. Those worked in heat may be grafted either saddle or wedge, the first making the stronger union; the second is good for small bits of choice varieties. Side or whip grafting is also a common method, the stock being shorn of most of the leaves, but it is not cut down to the graft till the latter has formed a union. Double glass should be used to cover them, that is, the grafted stocks should be put into a case, or under hand-glasses in a propagating-pit having a gentle heat and moist air. Tender leaves made under glass will not stand the summer sun. In April good results may be obtained in a cold pit. Whip-grafting is best for grafting in the month of August.

FOREIGN CORRESPONDENCE.

VERSAILLES.

EVERYONE who visits the capital of France should take a trip to Versailles, where the park and palaces contain such a store of French artistic and architectural treasures. From a horticultural point of view, the town and its environs are particularly interesting. There are firstly the parks, belonging to the Royal Palace and the palace of Trianon. Laid out by that celebrated landscape gardener, Lenôtre, during the reign of Louis XIV., these parks, with their magnificent fountains, are the great attraction to visitors of Versailles. In the vicinity of the Royal Palace the grounds are laid out in a formal style, with terraces leading down to the park, which, although divided by straight walks, is otherwise laid out in a more irregular way. In harmony with the straight outlines of these terraces are the clipped pyramids of Conifers, and the square clipped hedges bordering the flight of steps leading from one terrace to the next below.

attention to the raising of new varieties, or to developing the growth of plants raised by others.

So many new and valuable varieties are introduced every year, that it becomes absolutely necessary to strictly weed out, even from the largest collection, those least deserving of cultivation.

With a view to assisting those readers of the *Gardeners' Chronicle* who have not had the opportunity to inspect the novelties for themselves, I purpose noting those that have come under my own observation. All that I mention may not be absolutely new, but they possess points of excellence that cannot be safely overlooked by exhibitors who aim for the highest honours.

Japanese varieties are increased much more rapidly than any other section, owing to the greater ease with which they produce seed. I will therefore speak of this section first.

General Paquis was sent out by M. Calvat in the spring of the present year. The bloom itself reminds one of Mrs. Falconer Jamieson in its character and

not unlike Miss Dorothea Shea. The blooms are of massive build, and there is refinement in the florets. The colour on the upper-surface is rich but soft rosy-crimson, the reverse old-gold.

Lord Ludlow is one of the most promising varieties of this season. The blooms are large and well built. The colour is distinct, having an amber base, each floret edged and flushed crimson.

Miss Nellie Pockett is an Australian-raised variety, with narrow florets that curl upward at the tips. The colour is creamy-white.

Mrs. White Popham is of massive build, having broad florets, which incurve slightly at the tips. In colour it is blush-white, heavily flushed with purple; silver reverse.

John Pockett is another Australian. In form it is identical with Robert Powell; also an incurved Japanese. The reverse colour is chestnut, and the surface dull crimson.

President Bevan was sent out by M. Calvat this year. The florets are a trifle too close for the flower

In one of the deeper lying parts, near the palace, much floral wealth is displayed in the borders. They are chiefly filled with scarlet *Pelargoniums*, yellow *Calceolarias*, and blue *Ageratum*, together with *Coleus Hero* and *Verschaffelti*, that soften the contrast between the hard colours of the three first-named plants. Much use, too, is made of *Gaura Lindheimeri*, sending its loose flower-spikes far above the other plants contained in the border. At intervals pyramids of *Hibiscus*, *Syringa persica*, &c., are planted in the same bed.

Round the Palace of Trianon the designs are more complicated, and bordered by low Box edging. Here much use is made of *Coleus*, *Iresine*, the different kinds of *Alternanthera*, and other low carpet-bedding plants. A fine effect is produced by some groups of *Salvia splendens*, *Ingenieur Clavenad*, whose splendid red flower-spikes stand out advantageously against a background of dark green shrubs. *Cannas* also play a large part in the decoration of this park.

M. DUVAL'S NURSERY.

In and around the town there are a good many nurseries. In the first place comes the well-known horticultural establishment of Messrs. Duval et fils. In the [houses of this firm many plants worthy of note are to be found. One of the specialties for which the firm is known are *Bromeliads*. Whole houses filled with these tropical American plants are to be seen there. Amongst the plants in flower I noted firstly *Vriesia rex* ×, one of the many hybrids obtained by the firm. The bright scarlet-coloured spikes attain a length of nearly 1 foot. Then there is the new *V. Poelmanni*, shown last spring at the Ghent show. Further, *Caraguata lingulata splendens*, sending up its cup-like inflorescence just above the foliage; *Caraguata cardinalis*, with lighter-coloured foliage, and bright red and yellow flower-cups. Remarkable, too, is *Streptocalyx Vallerandi*, a plant with narrow spiny leaves. The flower-spike has the form of a long pyramid, rounded off at the base. The bracts are dark salmon-red, with ramified spikes of blue flowers at the bottom of each leaf. The whole, without the petiole, measures 1½ foot in length. Then there is the beautiful *Tillandsia Lindenii vera*, with narrow, hard leaves, and a flat, elliptical inflorescence, composed of bright rose-coloured bracts, very close together, from which spring large blue flowers; *Caraguata (Tillandsia) Zabni* has graceful, low, red-veined leaves and bright yellow branching flower-spikes. Amongst the *Bromeliads* of ornamental foliage are *Caraguata Peacocki*, with transparent red leaves, broadening, and finally striped with white at their base; *Nidularium Innocenti var. erubescens*, a compact plant, with dark brown, clear foliage; further, *Hoplophytum robustum variegatum*, with long, white, striated leaves, with finely dentated edges. *Tillandsia (Vriesia) tessellata*, of compact habit, with rather broad leaves, regularly striped lengthways with white lines, broken by narrow transverse lines. Hanging down from the roof in Orchid-baskets are the different kinds of *Cryptanthus*, the prettiest being *C. bivittatus*, *C. Beuckeri*, and *C. zonatus*, with wavy leaves, crossed by white and brown bands. Further there were *Vriesia splendens* major, with black cross-lines on the leaves, and long soft, red flower-spikes; *Billbergia thyrsoides*, with hard shiny leaves, and beautiful dark rose-coloured bracts. Four large houses are filled with Orchids. In one of them there was at the time of our visit a fine display of *Cattleya labiata*.

Another specialty of the firm is represented by the *Anthurium Scherzerianum grandifolium*, of which they obtained some new strains, notably those with very large dark scarlet spathes, and another of a salmon-red colour.

Further, there are grown in quantity *Azalea indica*, *Dracenas*, *Crotons*, and *Ferns*. Amongst the latter there is a large stock of *Adiantum æthiopicum* and *A. scutum*, both very good. Worthy of note is *Didymoclaena truncatula*; the young leaves of this plant are of a fine red colour. I noted, too, some specimens of *Asplenium nidus-avis*, the Bird's-nest Fern, with fronds nearly 2 feet in length.

Amongst other plants is remarkable *Ropala elegans*, having long pinnate leaves, the whole plant covered by a brown woolly substance. Further, *Medinilla magnifica*, *Heliconia illustris*, *Alocasia metallica*, *Pandanus Veitchii*, and *P. utilis*, attracted my notice.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

NOVEMBER 22.—Present: Dr. M. T. Masters (in the chair); Mr. B. Nnett-Poë, Rev. W. Wilks, Mr. Michael, and Rev. Professor Henslow (hon. sec.).

Tea-plants overrun by Mites.—Mr. Michael gave an interesting account of a new species of *Acarus*, sent by Mr. E. E. Green, Hon. Gov. Entomologist of Eton, Pondalucya, Ceylon. They were forwarded in tubes filled with sterilised air, a plan which Mr. Green had found very useful for preserving fleshy insects in their natural form and colours. He also forwarded specimens of young Tea-leaves attacked by the mite, which causes considerable damage and loss of crop on the Tea estates in Ceylon. Mr. Green writes as follows:—"Some years ago I gave a description and figures of this mite in a little pamphlet on *Insect Pests of the Tea Plant*. For purpose of registration I gave it the provisional name of *Acarus translucens*, but I find that this name is already occupied by a different mite, described by Nietner in his *Enemies of the Coffee-tree*; therefore the insect is still nameless. I should be glad to have it properly identified. It is curious in laying two different kinds of eggs, one form being quite smooth, and another form rather larger and beautifully beaded. The latter is the most usual, and I have watched the emergence of the mite from this egg. I have only recently noticed the smooth eggs. The immature insects are very sluggish, the mature ones decidedly active. They attack the young leaves only. As each bud unfolds they move up on to it, deserting the older leaves, which, however, are permanently injured. The attack of the mite imparts a brown scaly character to the leaf cuticle, which persists throughout its life. When the unopened leaf-bud is attacked, the punctures are concentrated upon the groove and the infolded edges. This forms a permanent scar, appearing like a strong sub-lateral nervure on the expanded leaf."

Mr. Michael observed that the mite was one of the *Tarsonomi*, a group only lately known, but proving to be great destroyers of vegetation—e.g., Box-trees in the Turin Botanic Garden were all destroyed in one season. Professor Canastini, of Padua, discovered that the mite bored beneath the epidermis of the leaf. Another species attacks the Sugar-canes of Barbadoes, but does not appear to be so injurious, though fresh canes swarmed with the *Tarsonomi*. Few species are known as yet, but they are very destructive. They are extremely minute, and have consequently escaped detection until the last few years.

Dahlia crossed with the Sunflower.—Mr. Lowe sent fresh examples of his supposed hybrid. They were very much arrested in growth, and malformed; but they would otherwise be regarded as *Dahlia*s. It may be observed that M. Martin Cahuzac attempted to cross the *Dahlia* with the *Chrysanthemum*; but in his case, as with Mr. Lowe, the supposed hybrid did not appear to be very marked. (*Gard. Chron.*, Dec. 11, 1897, p. 417.)

Pear-within-Pear.—Mr. W. J. Clarke, Manor House, Benbrook, Market Rasen, sent an example of this not uncommon monstrosity; and Mr. Bennett-Poë brought another example. The Pear has no core, but in its place the apical bud develops into another pseudo-Pear; the terminal bud then attempts to produce a third or more, finally a tuft of small leaves at the top represents the still growing terminal bud.

Pyrus crenata.—Dr. Masters remarked that this tree is peculiar for retaining its large and handsome leaves for a time, after most other deciduous trees have shed theirs. The leaf exhibited was from a tree in a garden at Ealing. It is a native of Nepal, and a figure was given in the *Gardeners' Chronicle*, January 3, 1874, p. 17.

NATIONAL CHRYSANTHEMUM.

WITH reference to a paragraph in our last issue at p. 411, we are requested by Mr. Wells, Earlswood Nurseries, Redhill, to print the following letter:—

"In to-day's *Gardeners' Chronicle* (Dec. 3) you make a very grave error in stating that I promised that I would withdraw all imputations against the National Chrysanthemum Society, and also against the individuals to whom personal reference was made. I distinctly state this to be false, for I said, as plain as any man could speak, that I would withdraw it on condition that the National Chrysanthemum Society promised that trade exhibitors should show nothing but their own productions. This promise was not made; and I make no apologies to anyone, except, as I stated, that if Mr. Waterer was not in earnest when he said a certain trade grower would give £10 to any charity if anyone could find any rust (fungus) on his establishment (which we were given to understand by Mr. H. J. Jones that this challenge referred to himself). I wish to state, that as this false report has appeared in your paper, I shall apologise to no one, and am prepared to take the consequences." [We are informed that the statements we made are in exact conformity with the minutes passed at the meeting of the Executive Committee on the 28th ult. Ed.]

DECEMBER 6, 7, 8.—The last of the Chrysanthemum exhibitions for the year 1898 was opened at the Royal Aquarium, Westminster, on Tuesday last. Contrary to the practice last December, the exhibits were on this occasion staged on the

ground-floor, there being ample room for the display. On the first day the number of visitors was not large, and it was possible to inspect the blooms with a certain amount of convenience. The only fault in this respect was due to the insufficient light that fell upon exhibits in certain positions. Upon the whole the exhibition was very satisfactory in regard to quality, and judged by previous shows held in December, it was not lacking in extent. Many of the classes brought capital competition, and few only were seriously lacking in this particular.

The best Japanese blooms were contributed by Mr. LUNT, of Keir, who won the principal prize at the very successful show recently held in the Waverley Market, Edinburgh. There were not very many incurveds shown, but several collections in the class for twelve blooms were of satisfactory quality. Members of the trade helped the exhibition very considerably by staging large and attractive exhibits of cut flowers.

The Floral Committee met on the opening day, but naturally enough there were few novelties to be inspected. Japanese Mrs. T. Dalton, from Mr. N. Molyneux, the Committee wished to see again. It is a narrow-petalled flower of reddish and yellow tints. Mr. Molyneux also exhibited eighteen blooms of a pretty white Japanese named Mrs. M. Simpson. Mr. W. Wells, Earlswood Nurseries, Redhill, showed blooms of M. Fatzer. The only certificates awarded were in the cases of the two following varieties:—

RED L. CANNING, a brownish-crimson or red flower, that may be recommended as an effective decorative variety. It was shown by Mr. A. Felgate, Jun., The Nurseries, Merstham, Surrey, who had a nice group of plants in flower.

MADAME R. CADBURY, a soft, creamy-white Japanese, with moderately wide, good petals. A refined flower of much merit. (Mr. Weeks, Thrumpton Hall Gardens, Derby).

PLANTS.

There was but one exhibit of six bush-trained plants of single varieties, viz., that from Mr. W. Davey, gr. to C. C. PAINÉ, Esq., Hillfield, Haverstock Hill, N.W. The best display was made by the variety *Eucharis*.

A very pretty group of plants upon a table was shown by Mr. A. Newell, gr. to Sir Ed. SAUNDERS, Fairlawn, Wimbledon Common, in response to the class for a collection of flowering, berried, and foliage plants. Looking at the exhibit, one noticed *Euphorbias*, *Codiaeums*, *Cordylines*, *Begonia Gloire de Lorraine*, *Roman Hyacinths*, *Bouvardias*, *Cyclamens*, *Richardias*, *Solanum capsicastrum*, &c.; the centre was composed of a graceful Palm, nicely staged amidst white *Hyacinths*. 2nd, Mr. W. Howe, gr. to Sir H. TATE, Bart, Streatham, whose exhibit, though also very attractive, was scarcely so neat or tasteful.

Mr. W. ORPWOOD, Andover Nursery, Uxbridge, had 1st prize for a collection of *Cyclamens* in flower, his well-flowered specimens filling a table of considerable size.

The best collection of *Primula sinensis* was also contributed by Mr. WILLIAM ORPWOOD, who had a collection of nicely-bloomed plants that showed good cultivation.

CUT BLOOMS.

The best exhibit of twenty-four Japanese blooms, in not fewer than eighteen varieties, was from Mr. T. Lunt, gr. to ARCHIBALD STIRLING, Esq., Keir House, Dunblane, N.B. He had excellent blooms of *Matthew Hodgson*, *Simplicity*, *Mons. Hoste*, *M. Gruyer*, *Mrs. H. Weeks*, *Oceana*, *Khama*, *Mary Molyneux*, *Mrs. F. A. Bevan*, &c. The Scotsman was well ahead of the other exhibitors in this class, but Mr. R. Kenyon, gr. to A. F. HILLS, Esq., Monkham, Woodford Green, was a creditable 2nd, his blooms being of very even quality indeed; 3rd, Mr. W. Slogrove, gr. to Mrs. CRAWFORD, Gatton Cottage, Reigate. There were six exhibitors.

The class for twenty-four bunches of *Chrysanthemums* of any varieties, shown with stems attached, and in bottles, made a fine display, and the collection from Mr. W. Howe, gr. to Sir H. TATE, Bart, Park Hill, Streatham Common, was very meritorious. The blooms were of good size, and the stems and foliage vigorous and healthy; Mr. NORMAN DAVIS, Framfield Nurseries, Sussex, was good in the 2nd place; and the 3rd prize was taken by Mr. S. J. COOKE, gr. to A. N. STEPHENS, Esq., Holmbush, Hendon. There were five collections.

Twelve Japanese blooms, distinct, were shown well by numerous competitors. The best blooms were from Mr. T. Lunt. He had *Graphic*, *Simplicity*, *Australie*, *M. Gruyer*, *Mrs. H. Weeks*, *Khama*, *Oceana*, *Mdlle. P. Rivoire*, *Louise*, *Mathew Hodgson* (a very beautiful colour), *niveum*, and *Edith Tabor*. 2nd, Mr. R. O. NORCUT, Broughton Nursery, Ipswich; and 3rd, Mr. F. King, gr. to A. F. PERKINS, Esq., Oak Dene, Holmwood, Surrey, the quality of the collections being very even.

Mr. J. Sandford, gr. to G. W. WRIGHT INGLE, Esq., Woodhouse, Finchley, London, N., obtained 1st place for six Japanese blooms, distinct, and all of them were good; the varieties were *Silver King*, *G. J. Warren*, *Simplicity*, *Golden Gate*, *C. W. Richardson*, and *Madame Carnot*. A collection from Mr. LUNT was placed 2nd, and included a good bloom of *Madame Carnot*.

Incurveds were by no means poor, there being considerable quality evident in a class for twelve blooms in not fewer than six varieties. Mr. F. King, gr. to A. F. PERKINS, Esq., Oak Dene, Holmwood, Surrey, won the 1st prize, and his best blooms were *Mdlle. Lucie Faure*, *Bonnie Dundee*, and *Lord Rosebery*. Mr. F. G. FOSTER, Brockhampton Nurseries, Havant, was 2nd; and Mr. R. Bassil, gr. to D. H. EVANS, Esq., Shooters Hill House, Pangbourne, 3rd. There were eight exhibitors in this class.

Of twelve bunches of Japanese varieties in not fewer than

six varieties, the only exhibit was one from Mr. R. C. NOTCUT, Broughton Road Nursery, Ipswich, who showed commendably.

Mr. Jno. Hoath, gr. to A. W. CHAPMAN, Esq., Crooksbury, Farnham, showed the best six bunches of Japanese Chrysanthemums. The varieties shown were Etoile de Lyon, M. Pankoucke, M. Gruyer, Western King, &c. Mr. GEO. ELDER was 2nd.

The best collection of twelve bunches of large-flowered single varieties was from Mr. G. W. FORBES, gr. to Madame NICOLS, Regent House, Surbiton; these flowers were not so brightly coloured or fresh looking as the blooms in the same section at the November fixture. Mr. G. Felgate, gr. to the Duchess of WELLINGTON, Burhill, Walton-on-Thames, was 2nd.

For the best collection of twelve bunches of small-flowered single varieties, Mr. G. W. FORBES was the best exhibitor; the flowers were of fairly good quality, but the effect of the exhibit suffered considerably from the foliage, which was very poor. 2nd, Mr. W. C. PAGRAM.

Single flowers were better in the class for six bunches of large-flowered varieties, and Mr. A. FELGATE, jun., nurseryman, Harsham, had the premier exhibit. His varieties were, Captain Felgate (pink), Yellow Giant, Mrs. Felgate (white), a large-flowered seedling, and Duchess Elizabeth (deep buff).

Mr. J. TULLETT was the best exhibitor of six varieties of the small-flowered section.

There were also half-a-dozen classes devoted to amateurs, and one for single-handed gardeners. In the last-named class, special prizes were offered by C. W. Richardson, Esq., Sawbridgeworth.

SINGLE VASES OF BLOOMS.

Miss EASTERBROOK, The Briars, Fawkham, Kent, had the best exhibit of a vase of Chrysanthemums arranged with any kind of foliage, grasses, or berries. It was a large trumpet-shaped vase, splendidly furnished with large and small blooms of Chrysanthemums, and suitable foliage; 2nd Miss C. B. COLE.

Miss C. B. COLE also presented a very good illustration of a hand-basket furnished with autumn berries and foliage. There being four additional exhibits of like character.

The best vase of Chrysanthemum blooms (amateurs), arranged with decorative foliage, &c., was shown by Mr. W. C. PAGRAM, gr. to J. COURTENAY, Esq., The Whim, Weybridge, and although its arrangement was not specially good, it well illustrated the value of the single-flowered varieties. 2nd, Mr. A. PAGE, gr. to A. L. REYNOLDS, Esq., Ravenscroft, Moss Hall Grove, North Finchley.

MISCELLANEOUS EXHIBITS.

Messrs. H. CANNELL & SONS, Swanley, Kent, showed a number of bunches of blooms of the variety Miss Harvey, a white flower with tubular forked florets, spreading at the tips; a pretty variety for decorative uses. Golden Dart, an excellent decorative variety of larger size; Swanley Pink, King of Portugal, &c., were included. Particularly gay and bright were the plants of Gloire de Lorraine Begonias, and zonal Pelargonium blooms in sprays.

Mr. NORMAN DAVIS, Framfield Nurseries, Sussex, furnished a large table upon the floor of the building, immediately under the organ. In arrangement its features were similar to those in his exhibit before the last meeting of the Royal Horticultural Society, and reported on p. 390. The various vases, baskets, &c., were very tastefully furnished with blooms of exceeding good quality. The varieties especially noteworthy were Madame Carnot and its sports, but decorative sorts were also largely in evidence (A large Gold Medal was awarded).

Mr. H. J. JONES, Ryecroft Nurseries, Lewisham, had a large table on the ground-floor, near to the dining-gallery. It was beautifully furnished with cut blooms in handsome vases and on boards. The vases were sparsely arranged over a groundwork of Ferns, &c. The blooms generally were good, and included specimens of a number of the season's novelties.

Mr. THOS. S. WARE, Hale Farm Nurseries, Tottenham, had a small exhibit of Chrysanthemum blooms.

Mr. ROBT. OWEN, Maidenhead, had a very attractive exhibit of cut blooms of Chrysanthemums, including many English-raised seedlings and named novelties. Most of them were upon boards, and these were backed by a number in bottles.

THE SCOTTISH HORTICULTURAL.

DECEMBER 6.—The closing meeting for the session was held on the above date, the President, Mr. Todd, in the chair.

An epitome was given of the cash accounts of the Chrysanthemum show recently held in the Waverley Market.

The facts that were stated by Mr. Mackenzie, the Treasurer, tell their own tale of how the very best flowers, fruit, vegetables, and music draw and hold the cash as well as the fashion in Edinburgh.

	The amount taken at the door on the first day of the show was	£	s.	d.
First do. do.	...	393	0	0
Second do. do.	...	346	0	0
Third do. do.	...	343	0	0

Total £1088 0 0

The total income from all sources was £1301; total expenditure, £1092; balance, £209.

The expenditure included the following, among other items:—Music, £233; prizes, said to be the largest yet given, £430; printing, £34; advertising, £57; fitting up Waverley Market, £90.

Neither has the Scottish Horticultural Association, which exercised such liberality in the Jubilee year, forgotten the

claims of charity this year. It decided last night to give the following sums to the following praiseworthy objects. There was £10 in addition, but I cannot recall the object: Royal Gardeners' Orphan Fund, £15; Gardeners' Royal Benevolent Institution, £15; Infirmary, £15; Hospital for Sick Children, £15; Prevention of Cruelty to Children, £10; two sick and infirm members, who have served the Society for many years, donations of £10 each. Surely in these and other matters provincial societies can hardly do better than go and do like Edinburgh.

There were many interesting exhibits before the meeting; and a paper by Mr. Wright, Falkland Park Gardens, South Norwood, on the "Arrangement of Hardy Plants in the Garden," was read by the secretary.

ISLE OF WIGHT.

The monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport on Nov. 3. The Chair was occupied by Dr. J. GROVES, B.A., J.P.; who was supported in the Vice-chair by Mr. R. J. ELDRIDGE, J.P., C.C., Chairman of the Technical Education Committee of the Isle of Wight County Council. Mr. T. Gibbs, C.C., gave a most interesting and instructive lecture on "Birds," dealing especially with their value to gardens and gardeners. The lecture was fully illustrated with lantern-slides, which had been obtained from the Society for the Protection of Birds. The subsequent discussion was enthusiastically taken up by the gardeners present.

THE LATE ALDERMAN WM. ROGERS, J.P.

Obituary.

ALDERMAN WILLIAM ROGERS, J.P., of Southampton.—At the end of November there passed quietly away, at the age of eighty-one years, from the scenes he loved so well, and did much to beautify, William Henry Rogers, Alderman and Justice of the Peace for Southampton, for many years head of the well-known Red Lodge Nursery, and an enthusiastic arboriculturist. The removal from life of such a man leaves both local horticulture and local government something the poorer. The nursery of Red Lodge, situated on the high ground at Bassett, and in a very lovely district, was founded by the late alderman's father, William Rogers, in the early years of the fast-dying century. Originally of a wild, heathy nature, by dint of energy and labour, acre after acre was gradually rescued from barrenness, and made to produce luxuriant growth of trees and shrubs of all descriptions, and for many years the place had become, during the Rhododendron season of blooming, one of singular beauty and of attraction to the population of the town and neighbourhood,

who, on a free invite, flocked to see the beauties of that nursery. In a book which lies before the writer, written by the late alderman's grandfather, John Rogers, then in his eighty-fourth year, on *Fruits at Red Lodge*, where it seems he had retired, so that he might end his days in pleasant surroundings, he mentions that in the Southampton nursery, now carried on by his son, "all the varieties of fruits he describes are grown, and fully tested, that the public may not be disappointed in their purchase." This old gardener's longevity seems to have been inherited by his kind-hearted grandson. The late alderman occupied important offices in the town government, especially as chairman of the Cemetery Committee; and his work in this respect, the contiguity of his residence, and his eminent horticultural tastes, made him the special guardian of Southampton's splendid common—a huge wild expanse close to the town, such as few boroughs possess. No one wanting decorative material in shrubs, foliage, or flowers, for the numerous objects which in a populous place constantly crop up, ever applied to the Red Lodge in vain. To the town parks many trees and shrubs were from time to time presented. The alderman was a prominent supporter and patron of the Southampton Horticultural Society, and that body loses by his death a sincere friend.

Many years ago the Red Lodge Nursery had a formidable rival in that of W. Page & Co., at Hill, and some minor ones also. These being near the town, have long since been covered with streets and houses, but Red Lodge, being more removed from the town, remains undisturbed in its work and its beauty. Long may it be so, and may the present proprietor, Mr. A. C. Rogers, be enabled in years to come to hand it over to his successors still intact.

ARTHUR JENKINSON.—On the 28th ult., the remains of Mr. Arthur Jenkinson, of the firm of Messrs. Jenkinson & Son, seedsmen and florists, Newcasttle-under-Lyme, were consigned to their last resting place with manifestations of respect and regret. His illness had lasted four months, and he died at the early age of 35. The late Mr. Jenkinson's reputation as a floral artist were considered pre-eminent in the county, and he was remarkably successful in his groups, wreaths, and bouquets, at the exhibitions of the Shrewsbury, Wolverhampton, Trentham, and Hanley Park horticultural societies. Lately he had devoted his attention to Orchid growing, and his stock has surprised all Orchid lovers who have inspected it. His removal in the prime of a well-spent life, just as he had established a line of business he had laboured to build, is much to be deplored.

MAJOR GENERAL BERKELEY.—We regret to have to announce the death of this gentleman at Bitterne, near Southampton. The General, who was in his sixty-fifth year, was the son of our old correspondent, the Rev. M. J. Berkeley, whose initials, "M. J. B.," were familiar to all readers of this Journal during a long series of years. General Berkeley served in the Indian Army for many years. On his retirement he devoted himself to the cultivation of Orchids, and was an occasional contributor to the *Gardeners' Chronicle*, to which his father was for so long a period a tower of strength.

Orchid lore, both in its scientific and its horticultural aspect, was greatly advanced by the keen observation of Major-General E. S. Berkeley, whose travels in the native habitats of Orchids, gave him such facilities for conveying the most detailed accounts of them and their surroundings in his pleasant articles on the subject in the columns of the *Gardeners' Chronicle* and other publications. By this means the peculiar requirements of many species deemed difficult to cultivate were explained, as for example his article on *Phalænopsis Lowii*, &c., in our columns February 26, 1887, p. 279.

To his endeavour the re-introduction of many rare species is due, and among the new species discovered and introduced by him for the first time, we call to mind *Phalænopsis tetraspis*, which he found growing on Mangrove-trees in the Andaman Isles, and introduced in 1881; *Phalænopsis speciosa*, and its varieties, discovered in the lesser Islands of the Malay Archi-

pelago also in 1881; *Aërides Emerici*, and its ally *A. lepidum*, from the Andaman Isles in 1882; the pretty *Sarcocylus* (*Thrixspermum*) *Berkeleyi*, *Dendrobium formosum* *Berkeleyi*, *D. polyphelebium* *Berkeleyi*; and on the Great Coco the fine plant which was named by Professor Reichenbach, *Siccolabium* *Berkeleyi*, but which later the discoverer thought might be only a fine form of *Rhynchosstylis reclusa*. About these and many other plants, the clever traveller conveyed useful information in his own pleasant and circumstantial way, and by means of which he will live in the memories of Orchid-lovers so long as the art lasts.

PROFESSOR CARUEL.—We greatly regret to have to announce the death, after a long and painful illness, of this eminent botanist at Florence. Professor Caruel, who was well known in England, became Professor of Botany and Director of the Botanic Garden at Florence on the death of Professor Parlato. Professor Caruel took a leading part in organising the Botanical Congress and International Horticultural Congress held in Florence in May, 1874. He was a prolific writer on subjects connected with the Italian Flora, and continued the detailed *Flora Italiana* of Parlato. He was also the author of an excellent little treatise on Vegetable Morphology. Professor Caruel was an occasional contributor to this journal; and while we grieve over his loss to science, we have reason to mourn him as a friend.

MR. WILLIAM PRAGNELL.—Horticulturists throughout the West of England will regret to hear of the death of Mr. William Pragnell, who was for many years head gardener to Mr. J. K. D. Wingfield Digby, M.P., Sherborne Castle. Mr. Pragnell visited Sherborne during the course of Tuesday morning, 6th inst., and on return to the gardens he was taken suddenly ill and expired almost immediately. The deceased was well known at West of England Horticultural Shows, and his sudden demise will be a shock to his intimate friends, who regarded him as a man of average constitution. The deceased was a Mason, and was a P.M. of Lodge "Benevolence" (Sherborne).

EDINBURGH SEED TRADE.—The fourth annual dinner of the assistants was held on the evening of Friday, the 2nd inst., in the West End Café, Princes Street, when a large company of gentlemen sat down under the presidency of Mr. Peter Drew (Messrs. Peter Lawson's) to a splendid repast. On the removal of the cloth, and after the usual loyal and patriotic toasts had been given and duly honoured, the company was entertained for some hours with vocal music. The toast-list contained several well-known names, amongst those who made capital speeches being Messrs. Methven, Milne, and R. Laird. Mr. Todd, President of the Scottish Horticultural Association, gave some interesting experiences of the seed trade as it was many years ago. The meeting was pronounced to be the most successful yet held.

NOTICES TO CORRESPONDENTS.

A DOZEN PYRETHRUMS FOR CUTTING: *W. W.* *Boule de Neige*, *carneum plenum*, *carminatum plenum*, *candidum plenum*, *floribundum plenum*, *fulgens plenissimum*, *Hermann Steager*, *imbricatum plenum*, *Kleinholz* (single), *Lady Blanche*, *Madame Billard*, and *roseum plenum*. Most of the above have double flowers.

A DOZEN-AND-A-HALF ROCK PLANTS: *W. W.* *Alyssum montanum*, *A. speciosum*, *Androsace chamaejasme*, *A. carnea*, *A. pyrenaica*, *Antennaria dioica rosea*, *Arenaria purpurascens*, *Aubrietia deltoidea grandiflora*, and any other variety; *Campanula caespitosa*, *Phlox Nelsoni* and others; *Dianthus cæsius*, *D. glacialis*, *D. petraeus*, *Gentiana acaulis*, *G. verna*, *Iberis coriæfolia*, *Linaria alpina*, *Lithospermum prostratum*.

ADDRESS: *J. Gay*, 117, Victoria Street, Westminster, S.W.

BOOKS: *H. W. E.* The best book we know of covering all the subjects you mention is Professor F. Oliver's translation of Kerner's *Natural History of Plants*, in two vols. (Blackie & Co.) Of smaller books

dealing with parts of the subject only the number is "legion."

BOOK OF PLANS: *Smilax.* We believe Messrs. Cannell, of Swanley, publish a number of garden plans for designing flower-beds, flower parterres, and carpet-beds. Designs for flower-gardens are to be found in Thomson's *Handbook of the Flower garden*, published by Blackwood & Sons; and Kemp's *How to Lay Out a Garden*, Braibury, Agnew & Co., Ltd., Bouverie Street, Fleet Street, E.C.

BOUVARDIAS: *C. R. T.* The effects may be due to errors in cultivation, or to injurious fumes; but the blooms afford no clue.

CERCIS SILIQUASTRUM: *A Constant Reader.* The best methods of propagation are by seed and layering. The seeds may be sown in October, in pans of loamy soil stood on the ground in a cold pit from which frost is excluded; the latter may take place at any season, selecting a branch or shoot two to four years old situated near the ground. The selected shoot or shoots should be notched over each bud in the old wood, or have a piece of copper wire twisted tightly round and cutting into the rind, and then be sunk in the soil 2 to 3 inches, with the points of the twigs ranging above the soil in a slanting direction, the soil being covered with a layer of old leaves, moss, or Fir-needles. It may take from one to two years for all the seeds to germinate; and layers take the same length of time to form roots.

CHERRY TREE DROPPING ITS FRUITS: *T. C. M.* This is usually due to excessive fruitfulness or to sharp frosts occurring during the flowering of the tree, or soon after setting. There is no cure for the last, but efficient protection by means of coverings of canvas, "Frigi domo," or mats. Excessive setting can be averted by thinning the blossoms, or the quite young fruits; the former by preference. All varieties of Cherries grown out of doors are liable to cast their fruits from these causes. Pains should be taken to ascertain the condition of the soil as regards moisture, especially that of borders made many years, which is liable to become hard and compacted, and as a consequence impervious to moisture; the latter running off into the adjoining cultivated ground. The surface of such borders should be pricked up, and holes made at about a foot apart with a sharp pointed crowbar to the depth of 18 to 24 inches.

CHRYSANTHEMUM: *E. J. S. & Co.* The blooms may very possibly be a sport from *W. H. Lincoln*. You should cultivate a batch of the variety next season, and observe if its habit of growth, &c., is that of *W. H. Lincoln*. Should it prove to be such a sport, a pale blush flowering Lincoln can hardly fail to be valuable, as the type is almost perfect in constitutional characteristics. It would make a nice companion to *Niveum*.

CHRYSANTHEMUMS: *H. Penny.* Consult our advertising columns. You may obtain a good descriptive catalogue from any of the Chrysanthemum specialists. They will also be most likely to name the variety you have sent us; but you should furnish them with several blooms, and these should be of the most typical character possible.

FLIES ON RIPE GRAPES: *Junior Reader.* The flies are *Drosophila melanogaster*. We much doubt wholesome fruit being attacked by these flies. Species of *Drosophila* are common on rotting fungi, and on anything fermenting, collecting round taps of beer-barrels, &c. See *J. Curtis's Farm Insects*. You should cut all these off the bunches, and put them in bottles in a cool, quite dark room. The fruit is very sugary, being dead ripe, and the exuded juice may have attracted the flies. *C. O. W.*

IMPORTED PEONIES AND BULBS: *X. Y. Z.* The bulbs should not be kept out of the soil any longer than may be necessary. *Lilium auratum* or other species should be dusted over with powdered charcoal and sulphur before being potted. The soil may consist of loam two-thirds, peat one-third, no leaf-mould or other decayed substance being used in the soil at this potting, but a considerable portion of coarse sand. The pot should not be less than 8 inches wide for a single bulb, or 10 inches for three bulbs, and the bulbs should be placed about half-way down the pot, and covered about an inch with soil, the final filling up being done when the stems are 2 to 3 feet high. Lilies may be placed in the open against a wall, embedded in tree-leaves, and the pots covered with tiles or slates to exclude mice, snow, and rain, with a slight thickness of

leaves over the slates. The next best method is to place the pots containing the bulbs in cold frames, plunged by preference in leaves, cocoa nut fibre, or coal-ashes; or they may simply be stood on a coal-ash bed. Plunging is the better way, as then the soil is maintained in an uniformly moist condition, without the need of additional water until top-growth has advanced several inches. It is in affording water that injury to the bulbs most frequently occurs. Bulbs having any signs of decay in the scales should be bedded in sharp sand before being covered with soil. The *Pæonies* should be planted in large pots about half-way down, and the pots filled up forthwith with soil made quite firm about the roots. These may be treated similarly to the Lilies, and out-of-doors treatment is the most suitable. In your garden, at the sea-side, it would be quite safe to plant them in well-manured trenched soil, at 3 feet or further apart, and 9 inches deep. Both Lilies and *Pæonies* dislike a loose soil or a very light one, although there are exceptions; *Lilium auratum* succeeding for at least some years in peat and manure; but loose soils do not tend to longevity or much natural increase by offsets.

MADRESFIELD COURT VINE: *W. W.* Let the Vine be cut-back now, or before the end of January—the sooner the better.

NAMES OF FRUITS.—Applications to name fruits are so numerous at this season, as seriously to hamper us in the exercise of our editorial duties. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones, just approaching ripeness, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.

—*D. J. H.* 1, *Beurré Bosc*; 2, *Glout Morceau*; 3, *Winter Crassane*; 4, *Glout Morceau*; 5, *Bergamotte d'Esperen*; 6, *Marie Louise d'Uccle*.—*J. S.* Golden Noble.—*A. Wade.* Winter Queen.—*J. L. L. Adams'* Pearmain.—*D. F.* We cannot name your Apple from the specimen sent. It is not unlike *Forge*, common in Sussex.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*Mrs. B.* *Spiraea aræfolia*.—*J. W. McH.* *Polygala chamaebuxus*, native of Switzerland.—*A. F.* 1, *Platone lagenaria*; 2, *Maxillaria picta*; 3, *Cypripedium Chantini*; 4, a form of *Cypripedium Ashburtoniæ*; 5, *C. Sedeni*.—*J. M., Nottingham.* 1, *Carex japonica variegata*; 2, *Eranthemum atro-purpureum*; 3, specimen not sufficient; 4, *Blechnum occidentale*; 5, *Acorus gramineus variegatus*; 6, *Polypodium pustulatum*.—*Arum.* 1, *Thuya occidentalis var. plicata*; 2, *Asplenium trichomanes*; 3, *Cupressus Lawsoniana*; 4, probably *Cedrus Deodara*; 5, *Cupressus Lawsoniana*; 6, *Thuya orientalis var.*; 7, *Thuya dolabrata*; 8, *Thuya gigantea*; 9, *Todea superba*.

PERSIMMONS: *D. James.* See note in present issue, p. 421. If grown out-of-doors, it should be in some warm part of the garden, or against or in front of a south wall, and in such soil as would suit the Peach. The plant might succeed under the same kind of treatment as the Orange, or *Cattley's Guava*, *Psidium Cattleyanum*.

RHODODENDRON GRAFTING: *W. v. S.* See p. 425, in present issue.

SYCAMORE: *X. Y. Z.* The correct scientific name of the common Sycamore is *Acer pseudo-platanus*.

VINES DYING AT THE ROOT: *J. L.* Nothing could be more unnatural or injurious to Vines than to cover the border with a 6-inch layer of cowdung every year, shutting out air and warmth from the soil, in fact causing the death of the roots from suffocation. If the border consists of heavy tenacious loam, the conditions are further aggravated. You will be right in lessening the depth of the border by adding 1 foot of hard materials at the bottom, for doubtless it is most inefficiently drained if the soil goes right to the concreted bottom. Replant the Vines now, bringing the roots near the surface and adding the ingredients mentioned in your accompanying note, not making a too free use of Thomson's manure, or indeed any kind of manure. If the Vines need stimulus, afford manure water. The chief points are warmth, a free soil, moisture, good drainage, and manurial aids when they are needed.

COMMUNICATIONS RECEIVED.—*A. D.*—*J. H. W.*—Professor Henriques.—*G. M.*—*D. McD.*—Florence.—*H. R. H.*—*C. N.*—Antibes.—*R. H. Q.*—*W. G. S.*, Leeds.—*Wild Rose*.—*G. E. P.*—*H. D.*—*C. H.*—*E. THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 17, 1898.

BRYANSTONE HOUSE.

JUST outside the town of Blandford is a bridge that spans the River Stour, and the visitor cannot do better than pause for a brief space and look up the stream for a peep of the fine mansion of Bryanstone House, which from this point appears completely to nestle among the verdure of woods and trees. A glimpse is also obtained from this point of a new church built by Lord Portman, the owner of Bryanstone, and of many another house in place of an inadequate old structure. This is the modern equivalent, it would seem, of endowing a chapel, a monastery, or the like, by the barons of old.

On entering the approach by the lodge, the visitor, if he be a tree-lover, will be impressed by the large size of the overarching Beeches, Elms, Oaks, and many immense specimens of the common Yew that stand between and beneath them, many of them measuring from 30 to 40 feet in height and diameter. Though the soil is shallow, and the underlying stratum mostly chalk, trees grow here to remarkably large proportions.

The approach road is exactly a mile in length measured from the Blandford side, and the distance from the approach on the opposite side is the same. The mansion was completed about five years ago, after several years had been spent in its erection. It stands on high ground, involving an immense expenditure in the alteration of the old, and formation of new pleasure-grounds and shrubberies. The groundwork at this part of the place must have been very heavy, some parts having been raised 4, 6, and even 10 feet above the old levels. So skilfully, however, has this part of the work been carried out by Mr. Allsop, and the planting performed with such judgment that only a very critical observer could tell the new work from that previously existing.

The views from the house and its vicinity are very fine, and include extensive stretches of the county; and then the view of the house itself from the garden front, together with the broad steps and terraced green banks, and smooth lawns that surround it, impart a height and grandeur to the building that is more impressive than when looking at it from the higher terrace. This broad terrace is 125 yards long, and 100 feet in width.

Immediately in front of the two wings of the mansion are the flower-gardens, the beds cut in the soft elastic turf so indicative of ages of careful tending on the part of many generations of head-gardeners. The design of each garden is different, but the effect is quite harmonious. The beds are filled, it is almost

needless to say, with a very select lot of the best kinds of bedding-plants; and as becomes a flower-garden so near the dwelling, the general effect was good though brilliant.

The building of the church, following so closely upon that of the mansion, the removal of foundations and the formation of new roads, borders and lawns, and planting of shrubberies involved, as I have said, much labour. The heaviest part of the work, however, has now been accomplished, and there only remains some planting that will be finished this winter. The gardener's house is conveniently situated close to the glasshouses. The stove happened to be the first house entered, and immediately in front of us were some large specimens of *Begonia corallina*, trained on the roof, an interesting plant for such a position, which always has a pleasant appearance; moreover, its flowers are useful when cut for filling vases, for dinner-table decoration, &c. This is a plant which I can unreservedly recommend to those who have space at command, and if grown as standards it is a suitable plant for house and corridor decoration. *Begonia Madame Carnot* is similar, but the flowers are a little larger than those of *B. corallina*. In this stove were numbers of *Calanthe Veitchi*, with fine, well-grown pseudo-bulbs. Few plants are of greater value for autumn and winter decoration than *Calanthes*, and the number of varieties is now considerable. As Orchids for smoky towns, they are not desirable, the blossom falling a prey to winter fog and lack of sunshine; but out here in the pure air, as at Bryanstone, nothing could be nicer. An adjoining house contained Palms of considerable size for house decoration, a number of Ferns, and overhead large masses of *Stephanotis floribunda* and *Bougainvillea glabra* in flower at that time. Those highly-valued and odorous additions to our winter plants, the *Freessias*, are grown in large quantities, and the first bulbs were being potted on the day of my visit.

The Carnation mania in strong form has reached Bryanstone, and drawing my conclusions from what I saw, the *Souvenir de la Malmaison* seemed to be the favourite variety, though many others are under cultivation. Some 2000 in all are cultivated in pots. Uriah Pike was represented by a large number of plants that were already potted for winter display, and then to follow Uriah is Mrs. Leopold de Rothschild. One that is greatly valued as a variety for filling beds and planting in borders is *C. Duchess of Fife*, known also as *C. Maggie Laurie*, a wonderfully free flowerer, with blooms of a rosy-pink colour.

A show-house was gay with a galaxy of beautiful *Gloxinias*, healthy Ferns and Palms, and nice compact plants of *Plumbago rosea*, Sander's variety of *Bougainvillea glabra* in 6-inch pots. With these were large plants of the Veitchian strain of *Streptocarpus*, which has grand clusters of flowers; and several varieties of Ivy-leaved *Pelargoniums* trained over the back wall, plants of *Asparagus plumosus* being intermixed, forming a pleasing whole. In frames were remarked large plants of *Carnations Souvenir de la Malmaison*, which, being turned out of their pots, and laid on their sides, had been layered from every shoot. The protection of frames is liked because in rainy weather the lights can be drawn on, and the plants kept dry. By the side of these were frames filled with seedling *Streptocarpus*, and as these plants flower, the most desirable are marked, taken up, and potted. Planting-out is a more desirable method than potting, the plants

growing more freely, owing to the uniform moisture and temperature of the soil. *Begonia Gloire de Lorraine* had a house entirely to itself, and with excellent results. The plants were not in flower when I saw them.

The vineries are full of interest to the Grape-grower, many of the canes being inarched with varieties which Mr. Allsop feels sure will produce finer fruit than the old canes have borne latterly. *Gros Colman*, for instance, was worked on Black Hamburg four years ago, with the result that a strong cane is now bearing a good crop of fruit, the berries being larger, and colour better than when grown on its own roots. The Muscat-house contained many very fine bunches in an unripe state, but giving one the idea that they would finish of that rich amber colour that delights the eye of the connoisseur, professional or amateur, which is so difficult of attainment. *Madresfield Court*, *Black Hamburg*, *Gros Colman*, *Lady Downes*, *Black Alicante*, and *Gros Maroc*, which were noted in other vineries, were in excellent condition, and as has already been stated, Vine-inarching has been carried on with many, and capital young rods now reach well across the entire width of the houses. Mr. Allsop prefers to plant young Vines in the autumn, for he considers if some roots are made soon after planting, then the canes the season following come away much stronger than if planting takes place, say, in the month of March or April.

Tomatos are here almost all grown in pots, and these are placed in every spot where space can be found for them. The earliest plants to fruit had done very well, I was told, and still there were many fruits to be found on them. A lot of succession plants promised well, and one cannot but hope that the promise came to fruition in an autumn not rich in fulfilment. There is this to be said as a set-off to the much watering and other labours, that a potted Tomato can be brought indoors to ripen its fruits when the weather gives the cultivator hints that further hope of progress out-of-doors is vain. As varieties *Glenhurst Favourite*, and *The Cropper* are those mostly grown.

There are large numbers of *Roses* grown in pots for indoor decoration. *H. P.* and *Teas* are about equally represented, the freest bloomers and finest flowers being the favourites. At the time of my visit these *Roses* were snugly sunk to the rims of the pots in coal-ashes. *Cyclamens* are planted outside in a shady border, in leaf-soil, and when these plants break sufficiently strong, they are potted and stood in frames, bringing fine batches of bloom.

Chrysanthemums in large numbers are well grown, specimen blooms being those chiefly in request, although, as bushes for affording smaller blossoms, they find considerable employment. Some plants struck from cuttings taken in the month of March and April were remarked in 6-inch pots, and these are allowed to carry one good bloom each, and being dwarf they are useful in house decorations.

The kitchen-garden if left to the last, is by no means the least important, for everything grown receives the best of treatment. The drought had punished the Pea-crop; this, however, was a common experience last summer and autumn. Young Apples, mostly standards and bushes, were noticed with fine crops of good fruit upon them. Peach and Nectarine trees appeared in a very flourishing condition, and abundantly cropped.

Bryanstone is a model estate, with a model

garden managed by a skilful gardener, who not only cultivates plants under glass and out-of-doors in a very creditable manner, but who has an artist's feeling in all matters pertaining to landscape gardening. *Our Special Correspondent.*

THE FERTILITY OF THE SOIL.

As horticulture can only be successfully practised upon a fertile soil, it is evident that the maintenance of the fertility of the soil we cultivate is one of the most important of all economic problems. That the soil may be speedily reduced in plant-food under an improvident system of horticulture, and that the original fertility of a once fertile soil may be restored, although sometimes slowly and laboriously, are matters of common observation.

The point at issue is to learn to what extent we may call to our aid the discoveries of modern science in reducing the cost of, and making more effective the empirical methods of our forefathers, or whether we may substitute for these methods others far more effective.

While we have been disappointed in the expectation raised by the discoveries of the earlier chemists that chemical analysis was to be the X-ray, which should reveal clearly and definitely the plant-producing capacity of a given soil, and the food requirements of a given plant, yet it must be conceded that chemistry has done much for us in both these directions, and as we learn to read the revelations of chemistry by the assisting lights of geology and biology, we are slowly and laboriously, but surely, working out the problem of plant nutrition, and it now seems safe to formulate a few general principles as being sufficiently established to justify building upon them a scheme of horticultural management:—

1. The carbon of green-leaved plants is absorbed directly and practically exclusively from the atmosphere, through the medium of the foliage. At least, the soil supply of carbon is a matter of minor importance.

2. The oxygen of such plants is chiefly absorbed in the same manner by the foliage, or taken up by the roots in combination with hydrogen in the form of water; although a minor and comparatively unimportant source of oxygen and hydrogen may be found in the breaking up of nitrates and ammonia by nitrification.

3. The nitrogen of such plants is obtained invariably from the soil either directly from compounds of nitrogen with oxygen, hydrogen, or mineral or organic compounds—such as nitric acid, ammonia, nitrates and humus; or indirectly through symbiotic growth of micro-organisms living in the soil, which have the power of assimilating the free nitrogen of the atmosphere; this symbiotic growth being apparently confined almost altogether to leguminous plants.

4. The mineral constituents of such plants are taken directly from the soil, being absorbed by the roots in the form of solution in water.

5. The ten or more mineral elements found in the ashes of plants are furnished in abundance by practically all fertile soils, provided there be present a sufficient quantity of available phosphoric acid and potash, and sometimes also of lime.

6. The various elementary substances found in plants are combined with each other in certain definite proportions, varying for different species, but held within very narrow limits for each species; and the growth of the plant is measured and limited by the least amount of the various elements required for their growth.

Reducing these principles to the lowest terms, and stating them in general form, we may say that the plant will secure a full supply of carbon provided other nutrients are furnished; that the supply of oxygen and hydrogen is chiefly dependent upon the water supply; that the supply of nitrogen may be regulated by the use of mineral nitrates or ammonia-salts, or the setting up in the soil of those conditions which favour the growth of nitrogen-working micro-organisms; and that having provided

a full nitrogen supply, we may control the growth of the plants by giving or withholding phosphoric acid and potash.

7. The water-supply of plants is a matter of supreme importance, for not only does water comprise three-fourths or more of the actual weight of cultivated plants when growing, but it is the vehicle in which all the mineral and nitrogenous constituents of plant-food are carried to their destination. In performance of this function it is constantly passing through the plant, being absorbed by the roots and transpired by the foliage; it being estimated that more than 300 pounds of water must pass through the tissues for the deposition of a single pound of dry substance in the plant, and thus the question of the maintenance of the water-supply becomes one which cannot be neglected in the garden.

The nitrogen supply takes rank next to water in importance, for it is the ingredient which may be most quickly exhausted by an improvident system of horticulture, and which is the most expensive to replace by artificial methods.

When it is considered that the plant-food in the

we may not hope to be able to modify existing systems, and obtain the object in view more quickly and efficiently. *J. J. Willis, Harpenden.*

(To be continued.)

NEOBENTHAMIA GRACILIS.

IN our issue for September 5, 1891, a description of this rare plant from the pen of Mr. R. A. Rolfe, of the Royal Gardens, Kew, together with an illustration showing the habit of the plant, and the flowers and their component parts of natural size, are given, and now re-produced. *Neobenthamia gracilis* belongs to the tribe Vandeeæ, as it possesses a distinct stipe and gland to the pollinia, and to the sub-tribe Cymbidiæ, as the lip is adnate to the column, and without a spur. We are now enabled, by the kindness of Mr. F. W. Moore, of the Glasnevin Botanic Garden, to exhibit a fully developed head of flowers. He mentions the fact that his plant is stouter and more erect than our earlier figure, and than the figure in the *Botanical Magazine*, vol. 58, series iii., plate 7221, showed, and our artist has rather unduly emphasised this feature of the inflorescence.

FIG. 124.—NEOBENTHAMIA GRACILIS: SHOWING HABIT AND FLORAL DETAILS.

soil must be of very slow solubility, in order that it may not at once be washed away by heavy rains and artificial waterings, and when we reflect upon the observed fact that when we apply certain forms of soluble plant-food, such as superphosphate for instance, a large portion of it is immediately converted into an insoluble or very slowly soluble condition by reactions within the soil, it is absurd to expect to realize in the growth of a single season, or even in that of many seasons, the entire quantity of plant-food applied in manure.

But accepting the fact which seems to be demonstrated beyond question, that the entire amount of plant-food applied in a fertiliser will not be returned in one crop, the question arises, especially in view of the light which recent discoveries have thrown upon the methods by which the inert nitrogen of the soil is converted into assimilable form through the agency of nitrifying organisms, and upon the still more interesting problem of the assimilation of free nitrogen through the agency of symbiotic growth, whether

SELAGINELLAS.

WELL-GROWN Selaginellas constitute one of the chief attractions of the tropical fernery, and are in every way worthy of extended cultivation. Although they are a stage or two removed from Ferns in the scientific classification of plant-life—the larger-growing species, those with a distinct upright leaf-stalk, excel many Ferns in wealth of foliage and decorative effect. Many of the species may be cultivated in the temperate fernery with some success, but the plants do not make the luxuriant growth they would do in a temperature of 65° as a minimum. The treatment they succeed under is very similar to that required by Ferns—they are propagated by the same methods; those that produce rhizomes, by division of the rhizome; those that are of tufted growth, by division of the tufts; in all cases by raising from spores.

The divisions of the rhizome may be started into growth in a propagating-case with a slight bottom

heat, containing a moist atmosphere, affording a temperature of 70° till they become established; the divisions of tufted plants which do not produce rhizomes may be treated in the same manner. An

portions, passing all through a coarse sieve, adding a liberal quantity of coarse silver-sand to keep the soil open. The pots or pans must be well drained, as the plants require abundance of water for the greater

lapping scales forming the quadrangular extremities of the divisions of mature fronds, are ready to collect when the scales open somewhat; they should be sown as soon as gathered. As many 6-inch pots as are required should be half-filled with drainage; over this should be placed some rough fibre, and the pot filled to within an inch of the top with sterilised sandy loam, pressing this firmly, and watering slightly to fill up crevices in the soil. The pots must be covered over after sowing with a separate piece of clean glass, and placed in pans containing an inch of water; a temperature of about 65° should be maintained, with abundant atmospheric moisture, and careful shading. The seedlings should be pricked off as soon as large enough to handle, using a compost similar to that advised for propagating by division.

Among the best Selaginellas, the following are worthy of commendation:—

S. caulescens.—The fronds of this species attain a height of 2 feet; they are somewhat thin and slender, and of straggling habit. The variety *amena* has smaller fronds than the type, of various shades of green, and from its compactness is useful for pot-culture. Both are useful as cut fronds for spray and bouquet-making. These and *S. Wildenovii* are practically the only three large-growing Selaginellas which will keep fresh in a cut state for many hours. A pretty tufted plant is *S. emiliana*; the fronds are about 9 inches high, elegantly divided, and of a pleasing light green colour—it makes a nice single specimen in a small pot.

S. erythropus produces a finely divided frond, of wiry appearance; it is fairly robust, growing to the height of a foot or more. This also makes an elegant pot-plant. The var. *minor* differs in being smaller. *S. erythropus setosa* being smaller still.

S. flabellata resembles *S. emiliana*, but is of a little coarser growth; this species frequently shows beautiful autumn tints on the mature fronds.

S. grandis makes handsome fronds, measuring 2 feet in height, of a dark shining green colour; the lateral divisions are half-an-inch broad, and are closely arranged; in some instances the fronds incline to be spiral. It is a very dense-growing plant, requiring plenty of root-run, and liberal treatment. It needs a case to do well, or a position in the house free from fluctuations of temperature and atmospheric moisture.

S. hæmatodes may be regarded as the best of all Selaginellas. It produces flat, handsome fronds up to a foot across, of a deep shining green colour. It has a very rich appearance, the divisions of the fronds overlapping each other. It succeeds also in the temperate Fernery.

S. inæqualifolia and *S. Galeotti* are both of straggling habit, thin in the frond, and of little value as decorative plants compared with many others.

S. Martensii and var. *stolonifera* are plants of rambling growth, producing thin fronds, averaging 9 inches in height, the lateral divisions being a quarter of an inch broad. The var. *variegata* has white tips, the type being the most handsome of the three. These succeed also in the temperate Fernery.

S. molliceps is of small growth; it produces elegantly-divided fronds, somewhat cristate in character, of a light green colour, the extremities being tipped with gold; it is of dense growth, reaching a height of about 6 inches.

S. plumosa has a large frond of good substance, dark-green in colour with pendent tips; it attains a height of 1 foot, and is in every way a desirable species.

S. stenophylla produces a tuft of small fronds of mossy character, seen to good effect in large pans.

S. viticulosa has small fronds with drooping lateral divisions, of elegant and pleasing habit; it is of dense growth, and requires to be grown in pans well filled to be effective.

S. Vogeli is a very handsome plant, of the hæmatodes type, producing fronds which attain a height of 2 or 3 feet; the fronds are not so dense as those of *S. hæmatodes*, but are much taller. It is of robust grow, requiring plenty of root-run.

FIG. 125.—NEOBENTHAMIA GRACILIS. (SEE P. 430.)

Taken from a plant grown at Glasnevin Botanic Garden.

open compost is necessary to start them in, two-thirds sifted peat, and one-third leaf-mould and silver-sand mixed, will be found suitable for them. A heavier compost is required for established plants, consisting of peat, rough leaf-mould, and fibrous loam, in equal

part of the year. The colour of the fronds is enriched by damping-down the floors of the house daily with weak solutions of soot and lime-water. The spores, which are contained in the spore-cases or sporangia, found under the minute over-

One of the best for decorative purposes, *S. Wallichii*, produces light-green erect fronds, 2 and 3 feet in height, the lateral divisions of which are widely separated; these divisions are densely clothed with the scale-like pinnæ. It is a very handsome species, of robust growth.

S. Willdenovi is the scandent species common in gardens; it succeeds best in the stove-house, with plenty of root-run and liberal treatment, the growths attaining a length of from 10 to 20 feet, the broad, blue-tinted fronds occurring at intervals on the stem. It is frequently cultivated in pots for cutting, in cool-houses, but grown in this manner the plants show but little of the graceful effect they are capable of producing, depending from the rafters of the stove-house.

The small-growing mossy species are suitable for covering bases of Ferns, and for fernery rockwork the most interesting of them are *S. uncinata*, with blue-tinted growths, trailing along the ground; and *S. serpens*, a green species of similar habit.

Selaginellas thrive best on the shady side of the house, with abundance of water whilst in rapid growth, avoiding stagnation at any time; they will require less during the winter months, but must not be allowed to become dry. *Geo. B. Mallet.*

THE HARDY HEATHS.

THE hardy species of *Erica* are not only some of the most beautiful of evergreens, but their peculiar type of foliage, and their tiny, nodding, mostly bell-shaped, flowers, make them also some of the most distinct. In gardens where they can be successfully grown—and it is only where the soil is strongly impregnated with lime that they cannot—they ought to be indispensable. Several of the most useful of them, in fact, nearly half of the species that can be grown outside, are natives of our own heaths and mountains. The others have come from the continent of Europe; some of them from the south and south-west are only sufficiently hardy to be seen at their best in the milder parts of the British Isles. A few of the south European species are almost tree-like, attaining a stature of almost as many feet as some of our native species do inches, and where they succeed, as they do, for instance, in the Isle of Wight or in Cornwall, they rank amongst the loveliest and most charming of all shrubs. There are few that remain in bloom so long as these hardy Heaths, and although they are not very numerous, there is not a month of the year, except it be November, which one or the other of them does not help to brighten by its blossoms. Of the true species there are only twelve or thirteen, to which have to be added three or four natural hybrids, and several varieties mostly differing in colour only. They constitute, therefore, a small, compact group which can conveniently be grown in its entirety in even small gardens where the conditions are suitable. Fortunately they are not, like so many shrubs, sold under a number of confusing aliases. Of those mentioned in the following list only two, I believe (*carnea* and *lusitanica*), are commonly known by any other name than the one here adopted.

As the planting season is now here, it may possibly be of some use to bring the entire group before the readers of this journal, and to briefly set down the history and leading characteristics of each species and hybrid. So far as I am aware, the following list includes all that have been successfully and permanently grown out-of-doors in the British Isles:—

SPECIES.

<i>arborea</i>	<i>mediterranea</i>
<i>australis</i>	<i>multiflora</i>
<i>carnea</i> (syn. <i>herbacea</i>)	<i>scoparia</i>
<i>ciliaris</i>	<i>stricta</i>
<i>cinerea</i>	<i>Tetralix</i>
<i>lusitanica</i> (syn. <i>codonodes</i>)	<i>vagans</i>
<i>Mackai</i> (? var. of <i>Tetralix</i>)	

PROBABLE NATURAL HYBRIDS.

<i>Maweana</i>	<i>mediterranea</i> hybrida
<i>Watsoni</i>	(syn. <i>E. hybrida</i>).

These Heaths will thrive in any good moist soil that is free from calcareous matter. A good pro-

portion of leaf-soil should be added; peat, too, if available, and sand, if the ground be heavy and close.

E. arborea.—In the Isle of Wight and the milder parts of the south coast this is, perhaps, the most magnificent of all the Heaths, being really a small tree. Near Ventnor there is (or was, a few years ago) a specimen over 20 feet high, whose stem had a girth of 29 inches. About London, it can scarcely be called absolutely hardy, for it succumbs to our hardest winters. It is a native of the Mediterranean region, abounding along the coast from Marseilles to Genoa. It is found also in the Caucasus. A noteworthy character of the plant is the dense covering of hairs on the younger wood. The leaves are closely packed in whorls of three, and the branches have the same arrangement. It flowers most profusely from March to June in the leaf-axils of the short twigs that spring from the previous season's shoots, so that each of these shoots forms a great tapering panicle, varying from 6 inches to 18 inches long. The flowers are almost globular, and nearly white; they are not large, but appear in such profusion as to make this Heath one of the most showy of the taller species. The wood is used in the south of France in turnery work, and it is from it that the so-called Briar-root pipes are made—really a corruption of the French "*Bruyère*."

E. australis.—Like the preceding species, this is one of the taller Heaths, and although it does not get to be so big as *E. arborea* does, it reaches 6 feet or 8 feet in height. Unfortunately, it is one of the more tender sorts. It is of upright habit, and bears its leaves in whorls of four; they are cylindrical, except for the furrow on the under surface. The young wood is covered with a tomentum, but is not so distinctly hairy as the preceding species. The flowers are sweet-scented, rather cylindrical or pitcher-shaped, about a quarter-of-an-inch long, and of a reddish-purple; they are borne in terminal clusters, generally consisting of about four flowers. The species was introduced in 1763 by the Earl of Coventry. It is a native of Spain and Portugal, often growing wild on sandy hills and wastes. In this country it flowers in April, and continues in bloom for two or three months. The quadruple arrangement of the leaves and twigs, and the terminal clusters of flowers, amply distinguish it from *E. arborea*.

E. carnea.—Of the dwarf Heaths, this species is, I think, the most useful, and it is not far short of being the most attractive. With the exception of the hybrid between it and *E. mediterranea*, it is the earliest to flower, it is of perfect hardiness, and blooms not only with remarkable freedom, but over a period of three or four months, uninfluenced by snow, frost, or rain. It is of singularly neat and dainty habit, and as a rock-plant, as a carpeting beneath taller shrubs, or as an edging, it is equally admirable. Its foliage is of a very rich dark green (the leaves in whorls of three or four), against which the bright rosy-red of the flowers begins to show charmingly soon after the New Year. They appear towards the ends of the shoots, mostly in pairs, from each leaf-axil, the whole forming a cylindrical raceme, 1 inch to 2 inches long. Little need be said to recommend this plant; it has long been in cultivation, and is well known in gardens. It is figured in the early pages of the *Botanical Magazine* (plate 11), and is there stated to have been introduced from Germany in 1763 "by the late excellent Earl of Coventry." We are informed that "it was not much known till 1785, or thereabouts, when it was freely imported from Holland, and was hence long known as the Dutch Heath." It is a native of the mountainous parts of Central Europe. The variety *alba* differs only in its white flowers; it is an admirable companion-plant to the above. *W. J. Bean, Arboretum, Kew.*

(To be continued.)

CYANIDE OF POTASSIUM AS AN INSECTICIDE.

[POISON!]

It may interest your readers to have the results of what is probably the first attempt at the use of cyanide-fumes in greenhouses, for the destruction of insects in this colony, New South Wales.

Like all the growers of Orchids in the colony, I have been troubled with pests of various kinds, including thrip, red-spider, brown-scale, seed-scale, mealy-bug, ants (generally a sequel to scale and aphids), and probably what is the most troublesome of all, Orchid-weevil.

The first experiment was tried in what we know as the "Lily-house," which is 14 feet by 20 feet, 5 feet to the eaves, and 5 feet 6 inches from eaves to apex. Making allowance for the solid contents, as the Lily-tank, &c., according to the instructions in the *Gardeners' Chronicle* of July 16 last, I estimated that I would have to use 21 ozs. of cyanide of potassium, the same quantity of strong sulphuric acid, the latter being diluted with 14 ozs. of hot-water. Everything was divided into two portions. The cyanide was tied in bags, and swung so that it would drop immediately into the jars when desired, strings being carried to the outside. The hot-water was placed in the jars, which should be large for the purpose, and of course, capable of standing boiling water suddenly poured into it. The acid was poured slowly into the water. An ordinary wine or beer bottle is very convenient for the purpose, as the operator should not be too close to it. The acid will make the water boil at first, and probably sparkle up and burn severely. The house had previously been very closely shut up, except two ventilators, through which the strings were passed. The jars with the acid were placed immediately under the parcels containing the cyanide, and the gardener after closing the door, passed round, let go the strings, which allowed the cyanide to drop into the acid, and instantly shut the ventilators. An interval of 25 minutes was allowed to elapse, when one or two of the low ventilators near the ground were opened; then the door was pushed open (the wind was blowing in at the door), and the house fairly well cleared of gas before venturing in to open the top ventilators to leeward. This part was done very quickly as the fumes were still perceptible in the house.

Half-an-hour afterwards an examination was made. The fumes were slightly perceptible, and remained so for at least 24 hours. It was found that the quantity of cyanide used had been too much, and that half the quantity would have been sufficient. The quality of the cyanide was of the highest commercial grade, and fully 90 per cent. The material had boiled, there being a great deal of black froth, so the precaution to use relatively large vessels had been a wise one. I would not advise for such quantities as I used less than gallon jars.

The next day, on critical examination, it was found that everything in the way of insects visible had been killed. Frogs were dead. I was afraid I should lose my fish in the tank, but fortunately only two of these were found to be dead, doubtless having come to the surface. It destroyed all the ants, which are proverbially difficult insects to kill; and on searching for weevils, none could be discovered on the plants, though on the previous day about half-a-dozen had been found on similar ones. It is supposed that they had fallen down into the moss, where it would be difficult to find them. The gardeners and myself considered it was a grand success, and better than XL-All tobacco solution, which will destroy most insects, including thrip and red-spider, but which we have not found successful in destroying scale, ants and weevils.

A similar fumigation of a second house proved to be equally effective, except that it did not kill some large green frogs. It killed small ones; but the large ones, though not actually killed, were so sick even next day, that it seemed doubtful whether they would recover. It should also be said that the cyanide was on this occasion what was left from the previous attempt, and reduced to about half the quantity. Had fresh cyanide been used, I have little doubt but that the large green frogs would have succumbed. A few ants also were found alive next day; it is just possible, however, that these may have come from the outside.

It is a necessary condition that the foliage of the plants should be dry, and the utmost care should be exercised that the wind is blowing away from the

private residence, and that no persons be near the house being experimented upon at the time, especially on the lee side; also that all vessels that the cyanide has touched be carefully washed and the water thrown down the sewer or buried in a hole.

Employers attempting the operation should see to it the first time personally, so as to get the *employés* into a right way of going about it. *It is too dangerous to run any risk with.*

I should have said that on the second attempt a plant with mealy-bug on it had that insect killed. This was about the only insect we had not tested in the first experiment.

I am very doubtful whether it will destroy the eggs of insects. I intend to see how long it is before scale, thrip, and red-spider show themselves again, though, of course, they may be carried in by exchange of plants from one house to another. Subject to proper care being taken, I consider the above method effective beyond anything else I know of.

Since the above was written we have tried a third house. This was on the morning of the Eight-hour Day, on which it rained for a considerable period. The house had previously been damped down, so that it was charged with moisture which the rain outside did not permit to dry off as freely as usual. The foliage of the plants did not appear to us to be damp, but there must nevertheless have been a sufficient clamminess about it to permit the cyanide fumes to act on the foliage, to which serious mischief was done, though strangely enough it did not affect the few Orchid-flowers that were in the house. The lesson then learned is, that the house must be dry. I have also come to the conclusion that the acid which I used was too strong, and that it might be reduced in quantity, and water added to make up the difference. My reason for coming to this conclusion is, that the acid appeared to me to be strong enough, even though water had been added to it, to char the cyanide. I note also that in the original directions, when it is recommended to add the sulphuric acid to the water, it assumes that the acid is sometimes not strong enough to make the water boil. Whereas in this case, the first addition of the acid to the water made it boil freely, but on further adding the acid the mixture ceased boiling, so that it did not require additional acid as they suggest, but rather the addition of water. With regard, therefore, to both the cyanide and the acid, the material which I used must have been superior to that used in the American experiment, of which the article is so succinct. I am perfectly satisfied that for anyone obtaining the same grade of articles as I used, one grain of cyanide for every cubic foot of the house, is sufficient, and an equal quantity of sulphuric acid diluted with the same quantity of water.

I may mention that the first and second houses experimented upon were practically East India temperature-houses, and the third an intermediate temperature-house, containing Cattleyas, Lælias, Cypripediums, Oncidium, Cologynas, &c., all of which were more or less affected, but especially plants with plicate foliage. *Hugh Dixon.*

SURREY COUNTY GARDENING SCHOOLS.

THE report of the Surrey County Council's Technical Education Committee, upon the gardening work at the evening continuation classes, has just been presented. It states that in comparison to previous years the progress has been excellent, and the crops of hay, Potatoes, Peas, Beans, Cabbages, winter Onions, and Lettuces, on the whole, have never been so good since 1894. The dry weather which commenced in July caused much failure of winter greens and Cauli-flowers, but Kidney Beans were generally good. The root-crops, Potatoes in the end, were above the average, and Beet, Parsnips, and Onions were above the average in most gardens; but Turnips were below average merit in most centres, and Carrots were weaker than usual. Celery was creditable in many gardens, also Tomatoes, Vegetable-Marrows, and Leeks. Red Cabbage in some centres was fine, and flowers were in many instances charming. West

Farnham centre, with twelve gardens, scored 104 marks, the greatest average ever yet recorded, and so headed the list; and Chas. Orford became county leader, with the unprecedented number of 111 marks. To such an extent have averages been raised that no fewer than 176 competitors last year gained higher marks than the county premier of 1894, Geo. Budd, who only scored 75 points. The number of centres is now 30, and the garden-plots 373, and in each case there was an increase on the previous year. During the year classes had been formed for instruction in cultivation under-glass, and by the kindness of the Bishop of Winchester and Mr. S. Bide the glass structures at Farnham Castle and Alma Nursery have respectively been thrown open to the students. Mr. C. A. Pearson also allowed the classes, which numbered some 63 students, to inspect his glass-houses at Frensham.

The report upon the cottage-garden and allotment section states that 520 gardens and allotments had to be inspected, a great increase on former years. Notwithstanding prolonged cold spring, and subsequent drought and heat, the crops on the whole have been good. Sixty Certificates of Merit were awarded. The highest point in gardens was that of Mr. W. Wellman, of Banstead, who received 155 marks, and the highest allotment was that of Mr. W. Cneverton, of Surbiton. Other fine gardens existed, and the report of Mr. A. Dean concludes that it is probable Surrey furnishes gardens and allotments that cannot, for area, be excelled in the kingdom.

ORCHID NOTES AND GLEANINGS.

CALANTHE × VEITCHI.

IT is upwards of forty years since Messrs. Jas. Veitch & Sons, of Chelsea, raised this beautiful variety. Its cultivation is attended with varying success, some cultivators getting bad results, whilst others grow it with much vigour, and obtain noble flower-spikes. The two chief tests of good culture are the depth and degree of brightness in the colour of the flowers, and the number that expand fully at one time. Such an inflorescence, bearing forty-seven expanded flowers of a rich bright carmine-rose colour, and with more buds ready to open, is sent by Joseph Broome, Esq., Sunny Hill, Llandudno (gr., Mr. A. C. Axtell).

DENDROBIUM PHALÆNOPSIS ALBUM.

Although importations of this showy species of Orchid have been prolific in light-coloured forms, few possessing pure white sepals and petals have appeared. Out of the first importation a variety flowered which had this peculiarity, and on the lip a few light rose-purple lines. This being the nearest at that date to an albino, was known as *Dendrobium-Phalænopsis album*. Later an albino with no colour on the lip was found, which received the name of *D.-P. hololeuca*. The original plant of the true albino is in the collection of Elijah Ashworth, Esq., and a similar one in that of Sir Trevor Lawrence. A fine flower of pure white, except for a light rose purple veining on the front lobe of the lip, is sent by Mr. T. J. Nelson, Ashgate Lodge Gardens, Chesterfield.

THE WEST AUSTRALIAN DESERT.

THE following communication has been obligingly forwarded to us by Messrs. Jas. Carter & Co., of High Holborn:—

"I was told before I began, that I should find it impossible to raise a blade of grass or anything else on this ground of rock and cement, harder than rock; and at first I feared I should find it true, for on attempting to put a shovel (there are no spades here) into the ground, I could only get 2 to 3 inches of soil, then the pickaxe had to be brought into requisition. I dug out a hexagonal-shaped garden 18 feet across, and 2 feet deep, and I have sown Beans, Peas, Spinach, Beet, Broccoli, Endive, Radish, Turnips, Parsley, Kale, Carrot, Lettuce, on one half; Convol-

vulus, Sweet Peas, Nasturtiums, Poppy, Mignonette, *Viscaria cardinalis*, *Nemophila*, and Candytuft on the other half. The French Beans make a show, but I do not think they will yield well. Peas are magnificent, with pods 3 to 4 inches long, and full of large-sized Peas. Spinach is a continual feast, we have gathered good supplies five times, and within a fortnight thereafter another supply awaits us. Onions and Carrots do not thrive, but all the other vegetables are in splendid condition.

Mignonette, Sweet Peas, Tom Thumb Nasturtiums, and *Nemophila*, are in full bloom, the other flowers are coming on. People come from miles round asking the privilege of seeing the garden, and go away amazed that such things can be grown and look so healthy in a land where there is no water, and no soil, and where the sun makes the temperature vary between 80° to 110° in the shade; but economising the bath and house-water, and making shelter with old coke-bags sewn together, have much to do with it. *T. H. Edmonds.*

THE CHRONICLE OF A LITTLE CORNISH GARDEN.

LATE AUTUMN.—Preparations for next year, rather than present results, are now seasonable in the garden. Still it cannot be gainsaid that there are plenty of flowers and abundant interest. Of course, the most important flowers blooming are the semi-early Japanese *Chrysanthemums*, of which I have a number of varieties growing in the open borders. A few that I have specially admired are the large canary-yellow *Soleil d'Octobre*, with paler reverse; the chestnut *Crimson Pride*, with bright bronzy reverse; *Beauty of Scholing*, a sort of deep reddish bronze-yellow; *Bronze Prince*; the very dwarf *Orange Child*; the pure white *Queen of the Earlies*; and the beautiful red *M. Maxime de la Rocheterie*. Several of the beautiful single *Chrysanthemums* are beginning to open, but they will not be at their best until next month. I do not grow *Chrysanthemums* "as they ought to be grown," but simply as I should any other herbaceous plant. The result is, that I do not get any monster blooms, but simply masses of flowers of about one-sixth exhibition size. Some "perfect" specimens of exhibition blooms of Japanese *Chrysanthemums* have just been sent me. They strike me as almost indecently vulgar, the size of the flower being the quality which monopolises the whole attention. The flower, as it seems to me, is out of all proportion to the supporting stem, and has lost as much of its grace as a Japanese *Chrysanthemum* can do. Coming at the time they do, when we all spend more time indoors, it is fortunate that *Chrysanthemums* are such splendid cut flowers, lasting for a very long time in water.

Those truly perpetual bloomers, the Tea Roses, are, even now, flowering freely. The varieties in bloom include *Ma Capucine*; the free-flowering, salmon-yellow *Madame de Watteville*, each petal of which is edged with rosy-pink; the deep straw and orange *Perle des Jardins*; the beautiful but little-known *George Nabonnand*, with its handsome rose-red buds; *Souvenir d'une Amie*, with large rose-tinted blooms; and some eighteen others. Among the newer Tea Roses which I have grown, and found worth growing, are *Empress Alexandra of Russia*, a free-flowering rose, a coloured bronze, orange and crimson; *Souvenir de Jeanne Cabaud*, coloured copper, apricot and purple; a rose-flesh kind called *Madame Cadeau-Ramey*; *Frau Geheimrath von Boch* (which name would be interesting if pronounced by some country auctioneers), of a beautiful golden-cream colour; and a sport from *Madame Falcot*, named *Emanuel Geibel*.

The class of hybrid Tea Roses is rapidly growing in favour, and every year one sees more and more of these Roses grown. To my eyes they lack a very great deal of the delicate grace of the true Teas, but their value is, nevertheless, very great. The first hybrid Tea Rose was *La France*, which M. Guillot introduced in 1867. This very sweet Rose, with its beautiful pink and rose colouring, was one of those "chance" products of Nature's hybridisation experiments; but most, if not all, of the subsequently-

introduced varieties have been the result of artificial fertilisation. The delicately-tinted Captain Christy, which was the second hybrid Tea, being introduced in 1874, is everywhere a favourite Rose.

I have been planting against my trellis a number of climbing Roses, and also a selection of Vines, Clematises, and other climbers. A species of Vine with which I have been much taken is *Vitis heterophylla humulifolia*, with its markedly-lobed leaves, and beautiful blue fruits. This Vine was introduced from China about 1870, but does not appear to be much grown as yet. All the Vines, however, are worth growing for their foliage, if space can be spared for them. The beautiful race of Clematises deserve a volume to themselves. The different species bloom from March to December, and every shade of colour from white to blue, from yellow to scarlet, is represented. In the matter of scent, too, few flowers possess a sweeter fragrance than *Clematis flammula*, the wild Clematis of Southern Europe. This species and the hedge Clematis (*C. vitalba*), or Traveller's Joy of our English hedges, are the two best known species, and, until some forty years ago, were, with *C. viticella*, almost the only kinds grown. About that time, however, the Japanese and Chinese species were introduced, and English gardeners were made familiar with the *azurea*, *patens*, *montana*, and *lanuginosa* species. Of these the most important is *C. lanuginosa*, which was sent to England by Fortune in 1850. The flowers are very large, lilac-coloured, and star-shaped, and are produced during the four months, June to September.

Although often inferior to the species from which they are derived, yet it is difficult to over-estimate the importance of the numerous beautiful hybrid Clematises which have been produced. Of them all, perhaps the popular favourite is *C. Jackmanni*, with its deep, velvety, purplish-violet flowers; and it is itself the parent of a whole group of varieties. The treatment of most of the Clematises is simple. They are satisfied with ordinary garden soil, and simply require a little shelter, plenty of air and light, and some support to climb. The different sections require pruning in different ways. The plants of the *Jackmanni*, *viticella*, *lanuginosa*, and *cerulea odorata* sections require to be cut in the winter well back to the old wood, as they bloom on the shoots of the current year; on the other hand, the *florida*, *patens*, and *montana* sections should be pruned as little as possible, as they flower on the previous year's wood. Of the outdoor kinds, *C. patens* and *C. montana* are the first to bloom, and the *Jackmanni* and *lanuginosa* sections carry on the flowering till late autumn. *Harry Roberts, November.*

SOME NEGLECTED GREEN-HOUSE PLANTS.

(Concluded from p. 402.)

SCUTELLARIA Mocciniana, although usually grown in the stove, is nevertheless well adapted for the purpose under consideration. Cuttings taken in spring and rooted in the propagating-frame, if potted off into 48-sized pots, and grown in a temperature, at night, of about 60°, will make nice plants for the late summer and autumn. The young growths should be pinched once or twice, with the object of forming nice bushy plants. An abundance of showy scarlet flowers may then be expected, as these are produced in bunches at the end of the shoots.

The numerous hybrid forms of *Lantanas* are very useful as summer-flowering subjects, though some, perhaps, may object to them, on account of their slightly unpleasant scent. They are propagated by cuttings taken in the early autumn; these, when rooted, winter well in a cool house. In spring a move into 48-sized pots will be necessary, using for the potting compost loam and leaf-mould in equal quantities. If large specimens are required a further shift, during summer, into 6 or 8-inch pots must be given. *Lantanas*, when grown as standards, make very useful decorative plants. With this object in view, the leader of the young plant should be trained to a height of about 2 feet before being stopped. The growths resulting from this operation will pro-

bably be rather weak, but after resting the plant during the following winter, and cutting back the former before starting in March, the succeeding shoots will be more sturdy and short-jointed. It is a mistake to use too large pots; top-dressing should rather be resorted to, or the plants repotted in the same sized pots, after removing as much of the old soil as possible. Very handsome specimens can be obtained in 6-inch or 8-inch pots.

I might write in detail of many more, but will conclude with a short list of others, no less interesting than the foregoing: *Statice profusa*, *Nierembergia filicaulis*, *Eucomis punctata*, *Calceolaria alba*, *Solanum Balbisii*, *Crinum Moorei*, *Jacobinia magnifica*, *Crassula falcata*, all of which are well worthy a place in a collection of greenhouse flowering plants. *Harry H. Thomas.*

THE PASSIVE LIFE IN BULBS AND TUBERS.

M. LECLERC DU SABLON communicated to the *Comptes Rendus of the Académie des Sciences* for October 31 a paper, which is of interest in connection with some recent communications to our pages on the same subject. The author says that two consecutive periods of activity in a perennial plant are always separated by a period of dormant life, during which the activity of growth appears to be suspended. This passive life is illustrated with much clearness in species which store up a reserve of nutriment in subterranean organs of widely different appearance. This is the case with the Tulip, the Hyacinth, the Asphodel, &c.

When the fruits are fully ripe, all the aerial parts of the plant wither, and there remains nothing but the underground bulbs or tubers which, until the recommencement of growth (that is sometimes during many months) show no exterior modification.

While, in the case of trees and shrubs, the season of rest usually coincides with that of winter, it is to be noted that most bulbous plants pass into a state of diminished activity at the beginning of the summer, and begin to vegetate again in autumn. This is the case with our indigenous Orchids, and with the greater part of bulbous Liliaceous plants, the *Ficaria*, *Arum*, &c.

It appears that these plants have to protect themselves from drought more than from cold. One of the chief characteristics among the reserve-organs during the period of dormancy is the comparatively small quantity of water which they contain. In tracing the variations in the proportionate quantity of water contained in a bulb during a whole year, it is seen that the minimum amount of water in the bulb always coincides with the commencement of the period of latent life. This diminished amount of water has no definite relation to the dryness of the soil. The comparative influence of more or less moisture in the soil is very slight, whilst the state of growth induces considerable variations in the proportion of water in the bulbs. It is, then, only in the osmotic power of substances enclosed in the cells that the cause of the low proportion of water contained in bulbs in a state of repose can be sought. The hydro-carbonaceous reserve matters are reduced to the minimum at the commencement of latent life. Then are found, in varying proportions, according to the individual, starch, inulin, dextrine, saccharose. The almost universal absence of glucose is one of the characteristics of the passive condition life; Onion-bulbs and the tubers of *Asphodel* form exceptions to this rule.

The author then draws attention to the internal modifications induced in bulbs or tubers in cases where the exterior indicates no change. Hyacinth-bulbs form a good subject for showing the nature of these modifications. At the end of May the period of active growth is over; the bulb then pass into a condition of rest, and can be drawn out of the ground. On June 1, M. Sablon found 29 per cent. of starch (the proportion was estimated by comparison with 100 parts of dry matter), 26 per cent. of dextrine, 1 per cent. of saccharose, and traces only of glucose. Such bulbs could apparently be kept until October

without showing outward change, but on analysing them the author found 26 per cent. of starch, 21 per cent. of dextrine, 3 per cent. of saccharose, and 2 per cent. of glucose. It was thus evident that during this period of apparent rest, important modifications were in progress; the digestion of the reserve stores had begun, and the bulb was proceeding to a stage when it would have been ready to grow. It is known from the observations of various writers, that bulbs and tubers cannot as a rule develop without passing through a period of rest. Onion-bulbs were equally modified during their resting period.

On September 10, a bulb already in repose held 10 per cent. of glucose, and 22 per cent. of saccharose. On December 4, analogous bulbs kept out of the ground contained 17 per cent. of glucose, and only 7 per cent. of saccharose. Thus it is shown why the alimentary qualities of the same variety of Onion may vary with the season, and also why, at a given moment, Onion-bulbs sprout whatever their exterior conditions.

The changes that take place in the *Ficaria* (*Celandine*) tuber during the season of repose are also considerable. After May, when the leaves are withered, a great part of the starch is transformed into dextrine, then into saccharose. Later on, an inverse transformation is effected; the saccharose is changed into starch. Finally, before growth in September, the starch is once more partially transformed into dextrine and sugar. In this case the reactions which take place during the resting period are more complex as they operate, according to the season, sometimes towards one, sometimes towards another end.

The greater part of bulbs and tubers which pass into a state of latent life are thus subject to considerable alterations in composition, the exterior form not being modified in appearance. The diastases, which are almost wholly wanting when the period of latent life begins, are formed little by little, and bring about the commencement of the digestion of the reserve substances, and the beginning of growth.

LAWSON, AND HIS WORKS.

(Concluded from p. 413.)

It is unnecessary to do more than skim the seventeen chapters of *A New Orchard*. A full-page engraving shows its shape to have been broadly oblong, with its longest sides running north and south. It was divided by cross and lengthwise walks into six divisions, the whole enclosed by hedges. The two northmost divisions contained the subdivided beds and borders of the kitchen-garden. The two central ones were planted, the one with fruit-trees at 24 yards apart, and the other contained a knot for flowers. Of the divisions nearest the house, which overlooked the orchard from the south, one exhibits a large Apple-tree, while in the other a horse is being trained by a man, who holds in his left hand a flexible wand.

For many reasons, of which the chief was good soil, shelter from winds, and water close at hand, Lawson considered a site lying near the bank of a river, the best for an orchard. As shown in the cut, the ground sloped from the house in a gentle declivity towards the river, and each of the three lengthwise walks were provided with two short "stairs" to render the descent more easy. Another river flowed between the house and the orchard. High moun's were raised at each of its four corners, and close to each of these is a stilt-house. On the west side, the out-fence was planted with stone-fruit, which is elsewhere explained as consisting of Cherries, Bullies, Damsons, Barberries, and Filberts.

On the east side the fence appears to have been of a more formidable nature. First, to protect from the east wind, a double row of trees consisting of Elms, Ashes, and Oaks, was planted. Between the lines of these, a walk was laid out. Inside this outermost fence and next to that surrounding the orchard was another walk, also with its row of tall-growing trees on each side. The orchard-fence was of the same character with that on the west side. Lawson had not a little to say about fences, much of which is reminiscent of Liebhaut and De Serres. It is, in fact,

not difficult to imagine his plan of an orchard to have been to a great extent idealised. What follows, however, appears to be more truly English.

A common kind of fence seems to have consisted of earth, or the latter and sand mingled together. The Rev. John Laurence, it may be remembered, as he tells us in *The Clergyman's Recreations*, when he entered on his duties at Yelverton, found his garden rudely enclosed with a wall of clay. Lawson, in so far as he liked these so-called walls, did so because wall flowers sown at "Mighill-tide" grew thereon and flowered "time'y for bees." Otherwise, he concluded they were of no value, "but soon decay by reason of Ashes, Rountrees (Mountain Ash), Burt-trees (Elder), and the roots of other trees" working their destruction. Stone, though expensive, formed the best wall. "Best," he adds, "of all others (in mine opinion) Quickwood and moats, or ditches of water, is the best fence." Where the ground is "unequal," double ditches are commended.

tree "to live the tenth part of his age," and this largely on account of the roots being unable to penetrate under the walls in pursuit of nourishment. He assumed with much truth that trees on a wall became excited in spring, when, if a hard frost occurred, it "kills the forward fruit in the very bud." He, moreover, mildly ridiculed the practice of those who planted trees "on the north-side of walls to save their roots from drought;" significantly adding, "The heat of the sunne is as comfortable as the drought is hurtful;" and "Want of sunne can in no way be helped while water is a souveraigne remedy against drought."

Lawson favoured a large orchard for two reasons; firstly, because its produce was two to four times more profitable than corn; and secondly, because it was cheaper in comparison to fence a large orchard than two or more smaller ones of the same combined acreage. Fruit-trees were also more fruitful when allowed room to spread. Instead of preparing small

the latter also graced the orchard. Some people, we are told, grew "grasse in their orchards, in order to moysten the ground"—a system, however, for which he had no good word.

Even at that early date fruit-trees ready grafted were bought and sold, but Lawson condemned the practice as at once expensive and bad, inasmuch as the young trees, after a lengthened journey, did not thrive; or one did not always secure the sorts wanted, but some others instead, and the proprietor and his gardener meanwhile got out of practice! For these reasons he concluded that "sets" (stocks) are best planted at home, and in due time grafted or budded. "Sets" were of many kinds. Lawson disliked slips (cuttings); less strong was his dislike of "Bur-knots." "Plants with rootes growing of kernels of Apples" were a usual and approved kind. Equal to these were suckers. But of all sets, he best liked those from seeds, sown where they were to remain to be grafted when sufficiently strong. Grafting and summer budding are described at length, as it was by all writers of the period.

In arranging an orchard, Lawson chose "the Warden and Winter Peare" as being the tallest, and a Pippin and Costard tree among Apples to be placed on the north side, Quinces on the south side "or ends," and Apple trees in the middle. Other fruits were planted in the fence.

In the chapter on dressing (pruning), our author shows himself to have been far in advance of his contemporaries. He avers it was a "common saying and unskillfull opinion," . . . "Let all grow, and there will be more fruit; and if you lop away superfluous boughes, they say, 'What a pitty is this! How many Apples would these have borne?'" Forests, like orchards, were grossly mismanaged. In scathing language, and at some length, he exhibits their sad condition. "For one thriving tree, four, nay, sometimes twenty-four evil thriving, rotten, and dying trees. What rottenness! what hollowness! what dead armes? withered tops? curtail'd trunks," &c.

His system of pruning is equal to that practised to-day. The trees were trained with short "boalls," and pruned so as to spread their "armes" and "boughes" widely around. They were kept moderately low; the lowest boughs within reach of a man's outstretched hand, and its highest twig to be not past "two yards higher, and that no twig touch his fellow;" and when any bough or spray shall "amount above the rest, either snub his top with a nip betwixt your finger and your thumb, or with a sharp knife, and take him cleane away."

Fruit-trees planted more or less close to the edges of walks were trained to suit the position, and branches occasionally met and formed a shimmering shade from the summer's sun. R. P. Brotherton.

FIG. 126.—PTYCHOSPERMA SANDERIANA.

There were each 2 yards wide and 4 feet deep, and sufficiently far apart to allow for the cast-out soil to form a raised walk 5 or 6 feet above the general level, and 2 yards broad on the top. The face of the outside bank was set with four chess or rows of Quickwood, and the inside bank with fruit-trees of the kinds already mentioned. Such fences even earlier than this were by no means uncommon in England, and, with slight modifications, they were in use both in England and Scotland for a long period afterwards. Traces of their existence are still occasionally to be found. An orchard, situated on an exposed position, was further sheltered on the North side by means of houses, walls, or high trees.

Lawson cultivated in his garden neither Peaches nor "Apricoakes." Towards "Arborists," who, in order to ripen these, or to obtain "timely," or early fruit of hardier kinds by spreading out their branches to the greatest extent possible, and then nailing them with tacks to walls, he exhibited but a slight degree of respect. Some of his reasons for discouraging wall-fruit are curious, e.g., because it suffered not the

at tions for each tree, was advised to level and trench the whole of the enclosed ground. The method of trenching was not unlikely that of his time, and was effected by opening a trench to the depth of 18 inches, which was filled with rotted manure, upon the top of which the material out of the next trench was thrown, and so on, until all the ground was similarly treated. Wisely, however, shallow planting is recommended, and the roots for the first year or two would not come in contact with a rooting medium so adverse to fruitfulness. The unusual space of 24 yards is noted as a proper distance to set the trees each from the other. The ground between the trees was not, however, left unoccupied, for here, during the next 20 or 30 years Lycoras, Saffron, vegetables, and flowers were cultivated. Broad and narrow walks were laid out to every part of the orchard, and these were bordered with "Currens, Feaberries (Gooseberries), Raspberries, &c." In suitable positions, banks and seats were raised, and planted with Violets and "Camomils," while walks of

PTYCHOSPERMA SANDERIANA,

Hort. Sander.

We have in this plant a spineless Palm, of graceful form, with pinnate leaves, as is readily seen in the small example herewith (fig. 126). As a small plant growing in a 6 or 8-inch pot, it makes an admirable decorative object for placing in vases, jardinières, &c. What will be its aspect when aged, we have no means of saying. A plant was shown by Messrs. Sander & Co., of St. Albans, at the meeting of the Royal Horticultural Society on October 25 this year, a First-class Certificate being awarded.

FOREIGN CORRESPONDENCE.

M. TRUFFAUT'S NURSERIES.

(Concluded from p. 426.)

A SIMILAR establishment is that of M. Truffaut, where, speaking generally, the notable kinds of plants are grown. Amongst Palms I noted here, *Cocos flexuosa*, *Caryota urens*, *Licuala grandis*, with undivided, elliptical, dentate leaves; *Phoenixophorum Seychelliarum*, and *Martinesia caryotefolia*.

Very remarkable was a strain of *Hydrangea* Hor-

teris, of compact growth, and with fewer heads nearly a foot across. A fine plant is *Cyathophyllum magnificum*. Two good Ferns were *Adiantum Hensleyanum*, and *Pteris gracilis*. *Poinsettia* (*Euphorbia*) *pulcherrima* is grown here in quantities; also *Physalis Franchetti*, with its ornamental seed-pods. *Rheedia glaucescens* is a little greenhouse plant, resembling, as to its foliage, *Mimosa*; the flowers are tubular, red, with a yellow margin.

THE POTAGER.

I also visited the horticultural school, known here as The Potager. Fruit-culture is the chief feature here, and a large area is devoted to it. The trees are mostly trained in cordon form along wires, and as espaliers for walls. My visit being in the beginning of November, I was too late to see the fruit on the trees. In the way of exotic plants, very few remarkable things are found here. In the large Palm-house I noticed a good specimen of *Areca Baueri*. A climber worthy of note is *Ceropegia elliptica*, with flowers of a yellowish-white colour, spotted with grey. Another plant of strange growth is *Dorstenia ceratophylla*; the inflorescence is in the form of a lengthened horse-shoe, provided with spines on all sides; the leaves are long, heart-shaped, springing from a kind of stunted stem, covered with scales. *Philodendron Andreanum* is a pretty plant, with heart-shaped, shiny leaves, brown, with white mid-ribs.

Amongst the *Chrysanthemums* exhibited at the time of our visit were *Colosse Grenoblois*, purple, incurved; *Olivier Silhol*, red-brown, with yellow reverse; *Globe d'Or*, of the same colour as *Source d'Or*, but of more globular form and broader petals; *Soleil d'Octobre*, a fine yellow variety; *Reine Nathalie*, white, incurved; *L'Aigle des Alpes*, much like *Edwin Molyneux*; *La Savoie*, a beautiful cream-coloured flower, the lower part bright rose; and *Morillon*, yellowish-brown, hairy. *Th. J. Dinth, Le Chesnay, November, 1898.*

PLANT NOTES.

PENNISETUM RÜPPELLIANUM.

As a decorative table-plant this elegant grass is extremely useful; the leaves are very narrow, $3\frac{1}{2}$ feet long, gracefully recurved, and drooping, resembling those of a small *Miscanthus*. The inflorescence is spicate, 9 inches in length, borne on a stem 3 feet high, and consists of a multitude of hair-like, silky awns, tinted a violet-purple, with yellow, feathery styles. The spike presents a very handsome appearance, which is retained in a cut state for a considerable time. The leaves, upwards of 100 of which are produced by a single plant, droop 2 feet below the pot, and remain green down to the tips. It is particularly suitable for single flower-stands, and out of flower as a border for staged groups of plants, such as *Chrysanthemums*, &c. It can be grown well with the utmost ease in a small pot, a point of some merit in table-plants. It is of considerable hardihood, and will keep in good condition in a temperature down to freezing point for some time. It grows most satisfactorily in the warm greenhouse. The plants like plenty of water, and can be raised from seeds. Seedlings are decorative within three months from seeds. *Geo. B. Mallett.*

CONTINENTAL NOVELTIES.

AMONG the novelties offered by Mr. J. C. SCHMIDT, of Erfurt, are a new transparent Radish, *Eiszapfen* (Ice-ice), 4 to 5 inches long, which exceeds all other varieties in regard to earliness, roots being fit for use in twenty-two days after sowing; *Cactus Dahlias* "Trump," orange-scarlet, and "Bravo," scarlet, and many others.

A CUCUMBER FOR WINDOW CULTURE.

In the *Handelsblatt für den Deutschen Gartenbau*, No. 46, we read of a new variety of Cucumber called *Kytowsche Zimmergurke* (Dwelling-room Cucumber),

which, while furnishing an ornament for the window, presumably one with a warm, sunny aspect, likewise provides the housewife with something of practical value. The variety succeeds, contrary to others, in a smallish flower-pot filled with rich soil, and furnishes a succession of short, thick, slightly-curved fruits.

Mr. F. C. HEINEMANN catalogues new varieties of *Salpiglossis*, *Begonias* with mottled or marbled segments, and *Gloxinias* with a yellow throat, besides *Pansies* and various forms of *Myosotis*.

Messrs. V. LEMOINE ET FILS, of Nancy, offer several varieties of double-flowered forms of *Begonia semperflorens*, already alluded to in these columns; *Anemone japonica* "La Fiancée," numerous forms of *Gladioli*, *Montbretia*, and *Phlox*. Among shrubs we notice mention of *Cotoneaster pannosa*, with small partially evergreen, oval, mucronate leaves, white on the under surface; the fruit globular, red, and of the size of a Pea. It is a native of Yun-nan, whence it was introduced by the Abbé Delavay. There are also various forms of *Deutzia gracilis*, *Philadelphus*, double *Lilac*, and *Weigela*.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorset.

The Warm and Intermediate-house.—*Epidendrums*, *Miltonias*, *Arpophyllums*, *Odontoglossum grande*, *O. Schlieperianum*, *O. Insleayi* and its variety *splendens*, *Zygopetalums*, and *Stanhopeas*, should be afforded water occasionally, so as to prevent the shrivelling of the pseudo-bulbs; *Vanda tores*, *V. Hookeriana*, *Luisias*, and other Orchids with terete leaves, need but little water while at rest, and light syringing overhead on warm, sunny days is all that is required now. *Cymbidiums*, *Lycastes*, *Anguloas*, and *Maxillarias*, many of which are partially terrestrial, should receive water occasionally.

The Cool-house.—Those species which belong to this house, viz., *Odontoglossum crispum*, *O. triumphans*, *O. Pescatorei*, *O. Halli*, *O. luteo-purpureum*, *O. Edwardi*, *Oncidium macranthum*, *O. serratum*, *O. loxense*, &c., should be still more sparingly afforded water in winter, but the materials must not be allowed to get very dry, and moisture in the surrounding air and ventilation are very essential to their well-being, the air being admitted by the ventilators near the floor. The *Masdevallias* which are inmates of this house are nearly always growing, still, the potting materials should not be kept in a saturated condition, or the leaves will become spotted. Among plants that require attention at this season are *Maxillaria grandiflora*, and *M. venusta*. If any of the plants are bare in the centre, they may be subdivided, and the divisions placed compactly together in new pots or pans, or re-potted singly. It is important, when re-potting them, to provide good drainage, abundance of water being required during growth. The compost should consist of fibrous peat one-third, and sphagnum-moss two-thirds, mixed with plenty of small crocks and coarse silver-sand. Pot firmly, and keep the base of the pseudo-bulbs slightly higher than the rim of the pot. Afford water sparingly till roots begin to form on the new growths, then gradually increase it in amount. *M. striata*, *M. s. grandiflora*, *M. Turneri*, *M. nigrescens*, *M. luteo-alba*, *M. tenuifolia*, *M. Hübschii*, *M. Kimballiana*, *M. praestans*, *M. Amesiana*, *M. fucata*, *M. scurrilis*, *M. Lindeni*, *M. variabilis*, *M. lepidota*, *M. picta*, *M. Sanderiana*, and *M. Houtteana* are species easy of cultivation, and the most suitable season in which to afford fresh rooting material is when roots appear at the base of the young growths. *Maxillarias* thrive in the cool-house, if stood at the warmer part of the house, and where they can obtain rather more sunlight than is necessary for *Odontoglossums*, but not direct sunshine. They require as much air and moisture as the other occupants.

Sophranitis grandiflora.—The growths of this plant being at this season but half-developed, it should receive plenty of root-moisture, carefully afforded, so that not any lodges in the growths, or is spilled on the blooms, to shorten their season of beauty. If any of the plants seem to need repotting, this operation may be carried out as soon as the flowers fade. Shallow pans are better than any sort of pot for *Sophranitis*, and at this season these should be hung

up near the roof, and in the summer stood along with the *Odontoglossum crispum* on the stage. Afford plenty of drainage materials, even to the extent of three-fourths of the depth of the pan, and over this place a thin layer of peat and sphagnum-moss, which is all that is necessary. *S. cernua* and *S. violacea* thrive in the cool part of an intermediate-house, as does the pretty *Ornithidium Sophranites*, now in bloom, which may be grown in the manner recommended for *Sophranitis grandiflora*.

Odontoglossum coronarium.—This species, in order that the flower-spikes may acquire strength, should be placed where sunlight can reach it, this being an important point. It is a plant which must be afforded plenty of moisture at the root, and sphagnum-moss in a growing state.

Temperatures.—The degree of warmth maintained in the various houses during this month should be as follows:—East Indian, at night, 60° to 65°; *Cattleya*, 55° to 60°; intermediate, a few degrees less; Mexican about 55°, and the cool or *Odontoglossum-house* as near to 50° as possible.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

Peach and Nectarine Trees.—I alluded to the earliest *Peach-house* in my Calendar for Nov. 26, and the time has now arrived when this house must be closed and forcing begun. Where the new early varieties are planted, three or four weeks hence will be soon enough to make a commencement, but *Royal George*, *Bellegarde*, and *Violette Hative* *Peaches*, and the *Elruge Nectarine* take a longer period to mature their fruits. See that the borders or the soil in the pots do not lack moisture. Where the forcing was commenced in late November, signs of growth will be evident in swelling buds, and to meet the needs of the trees the temperature should be raised to 50° at night, and 55° by day if fire-heat alone be employed, and during sunshine to 65°.

The Potted Strawberry Plants.—A succession of fruit can only be maintained by placing plants in the forcing-pit, preferably on or in a hotbed of leaves, at intervals of a week or ten days, and in number equal to the demands, remembering that twice as many are required to furnish the fruit, now, than will be the case six weeks hence. If a pit be used at the early stage, the plants will be near the glass, but in vineries and peacheries it is not so easy to find good places for them, unless shelves exist, hanging or other. The earliest batch should be examined, and if greenfly and thrips be discovered, fumigate the house or pit on the first calm evening. In mild, sunshiny weather, the temperature by day may range two or three degrees higher than when reverse conditions prevail. Do not let the plant remain in the leaf-beds after the young leaves push, and flower-buds become visible, but remove them to the forcing-houses, or *Strawberry-house*. Slugs are likely to harbour about the plants, so that each plant and pot should be closely examined, and it is good practice to wash the pots, and lightly surface the soil with loam. Do not start the plants at a higher temperature than 45° by night and 50° by day.

The Cucumber.—It is now time to sow seeds, and raise plants for setting-out in the month of February. My method is to employ new 3-inch flower-pots, and fill them to within an inch of the rim with a compost consisting of sifted loam $\frac{2}{3}$, Mushroom bed-mauure $\frac{1}{3}$, and press one seed into the soil in each. If the soil is moist, as it should be, no water ought to be afforded before germination takes place. The seeds should be raised in a hot-bed of 80°, with a temperature of 70° at night, and 75° by day. Failing this convenience, the seed-pots should go into a Pine-stove or propagating-house in a light spot, and be protected from mice if they are likely to be present. When the plants are a few inches high, partially fill up the pots with warm soil, and in a week or ten days report them in 5-inch pots.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford, Kent.

Garden Roses.—These, in some sense a new class of Roses, which some nurserymen have done much to popularise, bid fair to become prime favourites with all excepting exhibitors of Roses at exhibitions. The varieties are suitable for any position in the garden, and equally at home in covering an unsightly bank, an arch or a trellis, or a lifeless tree-stump. They grow with rapidity, and flower

abundantly, soon forming pleasing objects in the garden. They require scarcely any pruning beyond the removal of weak and blind, that is, flowerless growths. Most of them are single-flowered, and the tints of their flowers are very diverse. Of the newer varieties Messrs. Paul & Son's Dawn, and splendidly staged by them at the National Rose Society's show at the Crystal Palace this year, is a great acquisition; the colour is a rosy-pink, and the plant is stated to be thoroughly hardy. Royal Scarlet is another variety of much merit. Lack of space forbids mention of more names.

Clematis.—The present affords a suitable time for planting *Clematis*. By making a proper selection, the *Clematis* may be had in flower from April to the end of October. The species and varieties are suitable for pegging down so as to form beds in the flower-garden, the beds, if large, being given permanent edgings. The varieties of *C. patens* and *C. florida* flower on the old wood, whilst the *Jackmanni*, and varieties of it, flower on the newly-made shoots. All of the varieties are gross feeders, needing, therefore, liberal manuring.

Violets.—The plants in the outside borders have been flowering freely, needing, however, the constant removal of decaying leaves, otherwise the crown of the plant suffers. If the soil be of a very close nature, a slight sprinkling of leaf-soil and sand occasionally will be found a corrective of the fatal damping-off.

Bedding Plants.—Such plants as *Myosotis*, *Silene pendula*, *Aubrietias*, *Wallflowers*, and others, should be kept clear of decayed leaves, and the soil of the beds stirred with a hand-fork or Dutch-hoe wherever it be beaten down by heavy rain. Keep a sharp look-out for mice, or corms and bulbs will suffer when they push through the soil.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Eucharis grandiflora.—Plants which may have been resting in an intermediate-house may be hastened into flower at this season by having the pots placed in a mild hot-bed constructed with leaves and litter, in the proportion of three of the former to one of the latter, the bed being made very compact in order to run no risk from excessive fermentation. Other plants which have flowered, if in need of re-potting, may be attended to at this date, plunging the pots in the hot-bed likewise. After re-potting these plants, very little water is needed before growth has begun.

Allamandas, *Clerodendrons*, *Bougainvillea glabra*.—These plants, now resting at the cool end of the stove, if they are required to flower at an early period next year, may be plunged in gentle bottom-heat, and the soil in the pots moistened thoroughly, but affording no more water till signs of growth are visible, but damp them overhead two or three times a day. Maintain a night temperature of 60°. If *Bougainvillea glabra* has not been pruned, it should now be done. *Clerodendron Thomsonæ* var. *Balfouriana*, *C. fallax*, *C. paniculatum*, the first-named a climber, and the others erect-growing shrubs, do well under the hot-bed treatment at starting. The climber should be spurred in, and the shrubs cut down to the hard wood. No re-potting should be performed with these early-started plants, only the exhausted upper crust should be replaced with fresh compost, made firm by hand. Satisfactory results will not follow if the plants have not been rested in a cool-house. Naturally *C. fallax* and *C. paniculatum* are late flowerers, so that, even plants early started will not come into bloom before May or June. *Allamandas* of all species succeed under the same kind of treatment, but it is more convenient to grow the plants in pots, pruning the shoots severely just before the buds push forth, and pinching the young shoots once or twice during the season of growth. When grown on the roof or walls of a warm-house, the pruning may be much less severe, and considerable extension may be permitted. The earliest started plants should not have their roots disturbed beyond what is unavoidable, in putting the drainage in good order and surfacing the balls. Later plants may be re-potted when the buds start.

Gardenias.—In order that the plants may be strong and healthy, and the flowers of a large size, a temperature of 65° at night is necessary, and that they be kept free from mealy-bug. The younger part of the stock of these plants should not be stinted of rooting-space, and when a desirable-sized pot has been reached, and roots are abundant, manure-water, chemical manure, such as Clay's, or other, and clear

soot-water should be afforded from time to time in addition to clear water. Plants with swelling flower-buds may be placed on mild bottom heat. *Gardenias* should never become quite dry, neither should they be afforded excessive quantities of water, the leaf assuming a sickly appearance and the flower-buds dropping chiefly from this cause.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Raspberries.—The pruning and selection of the canes should be deferred till the chances of our getting severe frosts are over, because there is always a danger of the canes being killed when these are cut across and the pith exposed; but, weak and superfluous shoots and all suckers may be removed forthwith. The suckers, when dug up carefully, afford stock, which may be grown on in any good ground in the kitchen-garden or orchard, in readiness for forming new plantations. A good fence for the Raspberry consists of wooden posts standing 4 feet above the ground on each side of the rows, and 2 feet distant from them, at a distance of 16 feet apart. On the tops of these posts an iron rail about half an inch thick should be fastened, and the fruiting canes tied to this with matting, half of them going to each side; this leaves the central space for the young growths. On poor dry soils canes of the Raspberry seldom grow tall, and a single line of posts, 4 feet high, put into the ground close to each row, affords a more suitable means of training. These posts should carry two galvanised wires of No. 12 gauge, fitted with *raidisseurs* or tighteners for making them taut, fixed by staples at 2 feet and 3½ feet from the ground, the canes to be trained vertically to these. Either of the above methods is much better than tying the canes in a cluster to a stake, put in midway between two stools. Market-gardeners sometimes dispense with supports by pruning the canes back to 3 feet; but the crop of berries is light compared with that obtained by the other methods. The canes being made secure, and the ground cleaned, a thick dressing of farmyard dung should be applied, and left on the surface. Raspberry plantations should not be dug deeply, as by so doing the fibrous roots near the surface are disturbed; the frost and rain suffice to carry the fertilising properties of the manure to the roots, and the strawy part may be raked off the land in the spring, or allowed to remain as a mulch. New plantations may be made in mild weather at this season. In very dry soils Raspberry plantations are sometimes formed on a border having a building or wall on the south side, such sites affording the coolness and moisture so essential to the well-being of the plant. The ground on which a new plantation is to be made should be heavily manured, and trenched two, three, or four spits in order that it may continue to do well for many years. Plants that have been under cultivation in the home nursery for one year are better than suckers newly dug-up for making a plantation. With regard to the plants forming a new plantation, they should be cut down to within 4 inches of the ground in March, not when planted. *Superlative* is considered the best red variety, and *The Guinea* (Bunyard), a new white Raspberry, is said to resemble *Superlative* in all respects except in colour. [Those who like a more acid fruit for preserving purposes than *Superlative*, *Fastolf*, *Red Antwerp*, &c., should grow that most prolific variety, *Semper Fidelis*. Ed.]

THE KITCHEN GARDEN.

By J. W. MCHATTIE, Gardener to the Duke of Wellington, Strathfieldsaye, Hants.

South and other Early Borders.—If the land is of an adhesive nature, potting-shed refuse, or any rich light soil should be used as a dressing, together with an addition of rotten manure, and the land bastard or more deeply trenched. There may be cases in which these borders get too light from the many additions made, and then a dressing of heavy loam would be advisable for a year or two.

Broccoli.—If on an examination of the early sorts being made, a larger number of heads are found of a size fit for consumption than are required, instead of cutting these in the usual manner, let the plants be lifted and laid in moist soil in ordinary frames, turfpits, or an open shed.

Salads.—The beds of Endive, Radishes, Mustard and Cress, Lettuce, Chervil, also Parsley, raised as directed in previous calendars, should, when frosts

threaten, be protected with Russian bast or straw-mats, or such improvised material, as Fir-branches, &c.

Protecting and Mulching Vegetables.—Let the rows of Celery and Cardoons be afforded some efficient protection against frost, and put a strawy mulch over the crowns of Rhubarb and on the Asparagus-beds, the latter having decayed manure by preference. Beds of Horn Carrots may likewise have some dry litter or bracken thrown over them in time of severe frost. These roots, if wintered successfully, become very useful to the cook early in the spring.

General Work.—Let all kinds of heavy work be pushed forward in fine weather, such as wheeling manure to the vacant quarters, trenching, and digging, turning and mixing manure and rubbish-heaps, separating that which is ready for immediate use from that which requires a longer period of time to fit it for use. This is a kind of work on which the workmen can be profitably employed when the ground is too wet, or frozen too hard, or covered with snow, for digging to be expeditiously or well done. If the drains, or the walks and roads in the kitchen garden are in need of repairs, now is the time to get these done.

THE APIARY.

By EXPERT.

Ventilating Hives.—There seems to be no small degree of agitation lately among the wise-heads in our bee-keeping fraternity respecting ventilation of the bee-hive. Some advocate the use of front wedge-blocks, some front and rear spaces, others blocks under the four corners of the hive, and still others advocate raising the cover. Now, all of these methods of ventilation, excepting the last-mentioned, are applicable only to hives having loose bottoms, and every one of them, under certain circumstances, is subject to serious objections, which, it seems to me, will be suggested to any experienced bee-keeper. My colonies are very strong—made so by careful building-up as they need room to two stories of twenty frames as early as possible after the season opens; and when they show signs of "hanging out," I simply remove one or two frames from the brood-chamber, according to circumstances, and re-space the others, which settles the difficulty with my bees. I also remove the super of frames from the upper story of such as I wish to run for comb-honey, and substitute section-cases. The wider spaces in the brood-chamber give freer access to the upper storey; and I find my bees occupy it very fully as soon as the change is made, and when I raise the enamel cloth they poke their little heads up through the bee-space and say "Thank you." It must be quite a difficult task for a bee to make its way up through a mass of bees to the surplus chamber, when spaced close as we usually put the frames when brood-rearing is started in the spring. But it may be objected to my practice that the bees will thicken the comb in the brood-chamber, so as to reduce the spacing. I think not; if there is a prolific queen to occupy the frames with brood, and especially so if the bees are working in the surplus chamber—at least, this is my experience. My hives have an entrance of ½ by 8 inches, and by practising as above described I have no lounging outside by the strongest colonies I can create. If bees need so much ventilation, why do they carefully stop up with propolis every crack and crevice they possibly can? It is more room in which to move about that mine seem to want. I think my method of ventilation subject to less objection than any other with which I am acquainted. Of course, any manipulation of a colony of bees must be done at the proper time and in the proper manner to secure the desired results, which means that the successful bee-keeper is one who has his eyes wide open all the time, and sees and appreciates what is going on in his apiary from day to day, and from what he sees and from what he reads, is prepared to take advantage of circumstances. The more I study my bees (that is pretty nearly all the time) watching their operations, their changing conditions caused by changes of weather, varying seasons, as well as difference in methods of handling them, the more I am convinced that bee-keeping is not only the most complex, but the most interesting of all pursuits. Will some one of our scientific students of the fraternity tell us why the bees always before leaving the hive for their journey, wipe their eyes with their "fore-paws?" You may ask, "Do they?" Yes, they invariably do so. It is done as they approach the exit, where the light strikes the eye, or as soon as they reach the alighting-board.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, DEC. 19 { National Chrysanthemum Society:
Meeting of General Committee.

SALES.

MONDAY, DEC. 19 { Dutch Bulbs, Roses, Lilies, &c., at
Protheroe & Morris' Rooms.

TUESDAY, DEC. 20 { Imported and Established Orchids,
at Protheroe & Morris' Rooms.

WEDNESDAY, DEC. 21 { Japanese Lilies, Palm Seeds, Roses,
Continental Plants, &c., at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—59.4°.

ACTUAL TEMPERATURES:—

LONDON.—December 14 (6 P.M.): Max., 50°; Min., 49°.

PROVINCES.—December 14 (6 P.M.): Max., 52°, Scilly Isles; Min., 41°, Stornoway.

The Lindley Library. In the year 1864 a great International Horticultural Exhibition and Botanical Congress was held in Brussels. It was attended by several of our leading horticulturists, as was that at Amsterdam in the following year. These exhibitions were the precursors of a series held subsequently in St. Petersburg, Florence, Genoa, Paris, and other cities. The cordial hospitality offered to our countrymen on the two first-named occasions naturally stimulated them to do something to show that they appreciated the kindness shown them, and that they desired to reciprocate it. Moreover, the honour of British horticulture was at stake. We could not allow Belgium and Holland to remain without competitors. This was the origin of the famous Exhibition and Congress of 1866. Singularly enough, neither the exhibition nor the congress at its beginning found favour in high places where sympathy and support might have been looked for. The financial condition of the Royal Horticultural Society at the time was not such as to warrant the council in embarking on an enterprise which was certain to be very costly, and might not prove remunerative. A guarantee fund was however raised, and an independent committee was formed, comprising many of the leading horticulturists, and presided over by the late Sir WENTWORTH DILKE, with Sir DANIEL COOPER as Treasurer; and Mr. THOMAS MOORE, Dr. HOGG, and Dr. MASTERS as Secretaries—Dr. SEEMANN having resigned office at an early stage of the work. Where all concerned threw their hearts into the work and laboured to a degree we have never seen equalled, it would be invidious to particularise individuals. There can, however, be no impropriety in stating that the ultimate success of the undertaking, so far as it was the result of any one man's work, was due to the ceaseless energy and wonderful tact displayed by Sir WENTWORTH DILKE as chairman of the committee. We do not intend at this time to go further

back to ancient history. Our present object is to allude to some of the results of this memorable gathering.

We need not say anything on the influence it exerted on horticulture in general, or on any commercial advantages that may have arisen from it. At the time, these could hardly be defined with precision, but if we look to more tangible and persistent results, we find that the influence for good of this vast undertaking is still apparent.

A donation from the surplus of a sum of one thousand pounds to the Gardeners' Benevolent Institution, ensured a benefit to the pensioners of that Society which they still, and will continue to enjoy.

Then, the *Report of the Proceedings of the Congress, and of the Exhibition*, edited by Dr. MASTERS, forms a thick 8vo volume which may fairly be described as a remarkable production, and one which will be invaluable to the future historian of botany or horticulture. Copies of this report were distributed among all the foreign visitors who honoured us with their presence on this occasion, others were supplied to those who contributed memoirs and papers to the Congress, and were also sent to most of the great public libraries of the Kingdom.

Another result, though indirect, was the establishment of the Scientific Committee of the Royal Horticultural Society. The deliberations at the Congress brought home to many the sense of the desirability of bringing together, for purposes of mutual instruction, those who practice the art of horticulture, and those whose lives are devoted to the study of the principles on which that art is based.

Lastly, we may mention as a direct result of this memorable exhibition, the acquisition of the Lindley Library, the Catalogue of which is now at the service of the horticultural community. The career of the Royal Horticultural Society has been chequered to an extent beyond that of most Societies. Sometimes flourishing, it has effected great things for horticulture, and earned the respect and gratitude of those competent to judge. At other times wasteful expenditure on objects not directly connected either with the theory or the practice of horticulture, have brought the Society to the lowest pitch. In one of these periods of financial depression, it was even deemed necessary to dispose of the valuable collection of books which had gradually accumulated, as well as of the herbaria formed by its collectors. In 1866 the Society was not indeed quite in such a deplorable state as it was a few years later; but it was at too low an ebb, as we have seen, to take the lead, as it might have been expected to do, and it left to an outside committee work which would have been more fittingly, though, as results proved, not better, done by itself. At that time the Society had practically no library, nor any chance of procuring one. The opportunity was, however, not lost by the Committee of the International Exhibition. The Library of Dr. LINDLEY was purchased out of the surplus funds, and was placed in the hands of Trustees for the special benefit of the Fellows of the Royal Horticultural Society, and of the horticultural public generally. The Treasurer and Secretary of the Royal Horticultural Society for the time being are members of the Trust, and no wave of financial difficulties can in future lead to the dispersal of the Library. So long as the Society has its headquarters in or near the metropolis, so long must the Library remain in connection with it.

For some time after the acquisition of the Library there was no proper place for its reception; the books were stored like so much lumber in a room leading out of the arcades of the South Kensington garden. Here they were useless, and the most that could be said was, that they were not exposed to the weather. After a time the books were placed in an upper shed, dignified with the name of the Council-room, access to which was obtained by a tortuous stairway, and a passage so particularly narrow that some of those who had business to transact found it not altogether easy to effect their transit. Here, however, the books were arranged conveniently for reference by Mr. DYER, Mr. HEMSLEY, and others connected with the Scientific Committee.

Soon after the acquisition of the Library, a manuscript catalogue of the books was prepared with great care by Mr. ALFRED BENNETT. It consists of an interleaved copy of PRITZEL'S *Thesaurus*, which has been kept posted up to date, and which will still be of value as indicating the shelves upon which particular books may happen to be. On the removal of the Society from South Kensington to 117, Victoria Street, the library was for the first time properly housed. The want of a permanent librarian, responsible for the books and for their good order, was painfully felt. According to the deed of trust, the Society is empowered to appoint a librarian, as the means at the disposal of the trustees are not adequate for that purpose. For a long while the Society's financial condition was also not sufficiently satisfactory to secure the exclusive services of a librarian, except in a fitful and imperfect manner.

We may trust that now, when the Society is in a flourishing state, and the library is in better order than it has ever been before, no pains or reasonable expense will be spared to keep it so, and to employ a competent librarian for the purpose.

The want of a catalogue available for use by the Fellows at large has been long felt, and subscriptions have been received from a small number of the Fellows for the purpose of defraying the cost of its preparation and production. The Society and the trustees have also contributed, as far as their means have permitted, and the result is, that now at length a proper catalogue has been published. We can testify to the fact that great care and pains have been taken to render this list complete, and to avoid errors. It would be vain to hope that perfection has been obtained in this matter, but we may confidently trust that the errors are neither numerous nor of a serious character.

The additions made by the trustees to the original nucleus have been considerable, and some of the Fellows, following the example of Her Majesty the QUEEN, have from time to time presented valuable works to the library. The number of volumes in the old library was two thousand and five-hundred. The present library is estimated to contain nearly four thousand. Unfortunately, the present library does not comprise several expensive standard works, which together with unique collections of drawings formed part of the older collection, and the loss of which is to some extent irreparable.

The leading object of the trustees of the Lindley Library has, we believe, been to secure for the use of the public and of the Fellows valuable books of reference, illustrated works, and such as from their costliness or other causes are not likely to form part of the contents of a private library. Periodicals and many current

magazines have also been kept for reference. The preparation of the catalogue has, as we have said, revealed the want of certain standard books which ought to find a place in

intended for students' use. Young gardeners will more and more have to improve their brain-powers, and supplement the manual experience and dexterity they gain for themselves

works written in that language, and therefore not accessible to everyone. The fact is, that Germany turns out a far larger proportion of valuable text-books than does this country.

FIG. 127.—BEGONIA GLOIRE DE LORRAINE, IN THE GARDEN OF THE RT. HON. J. CHAMBERLAIN, AT HIGHBURY, BIRMINGHAM. (SEE P. 440.)

such a library, and which it is to be hoped may be supplied by the generosity of the Fellows. Whilst the library is mainly a reference library, the circumstances of the times demand that provision should also be made for the acquisition of the very numerous manuals and text-books

by availing themselves of the guidance and experience of others as recorded in horticultural literature.

Considering the progress of science in Germany, it is not surprising that a large proportion of the more recent accessions have been of

How it is done, how the finances are found to produce such books, how a sufficient number of customers can be found to buy them, are perpetual sources of wonder to us. In any case, horticultural literature in this country is too exclusively confined to elementary manuals,

and to books which are often mere compilations. Standard books of original research are scarce, and this must be the reason for the comparative rarity in the library of first-class horticultural books written in English. With botanical books the case is different, and the discrepancy is not so obvious. The library is also weak in old books—books that constitute the history of horticultural practice and botanical science. Dr. LINDLEY, as a working botanist, and pre-eminently a man of action, did not spend much time in studying old folios or pre-Linnean publications. For him the possession of works of more current interest was more important than the acquisition of volumes of merely historic interest.

Of late years, however, it has become apparent that the study of the "Fathers" has been unduly neglected. They have been overshadowed by the achievements of modern writers, and cast into the shade by the introduction of more perfect methods of investigation than they ever possessed. But for historical purposes the older books are invaluable, as furnishing evidence on the introduction and gradual evolution of numerous species and varieties. To this end, we may in future hope to see this department of the library considerably extended.

In any case, we think the Trustees and the council of the Royal Horticultural Society have earned the thanks of the community by the publication of this catalogue, which is practically the only one of the kind in the country so far as horticulture is concerned.

The Workmen's Compensation Act, 1897. THE following communication upon an important matter concerning nurserymen's and florist's employés has been sent to us for publication by Mr. CHARLES BUTCHER, solicitor to the Nursery and Seed Trade Association:—

"As this Act affects persons engaged in the nursery and seed trades who may have warehouses and employ their own men to do repairs, or have goods loaded or unloaded therefrom or thereto by machinery, attention is drawn to the following provisions of the Act and other Acts incorporated therewith.

The 7th section of the Act provides that 'the Act shall apply to employment on, or in, or about a . . . factory . . . and to employment by the undertakers as thereafter defined, on, in, or about any building which exceeds 30 feet in height, and is either being constructed or repaired by means of a scaffolding, or being demolished, or on which machinery driven by steam, water, or other mechanical power, is being used for the purpose of the construction, repair, or demolition thereof.'

'Factory' is to have the same meaning as in the Factory and Workshops Acts, 1878 to 1891, and includes any warehouse, machinery, or plant to which the provisions of the Factory Acts are applied by the Factory and Workshops Act, 1895.

'Undertakers,' in the case of a factory, mean the occupiers thereof within the meaning of the Factory and Workshops Acts, 1878 to 1895.

'Workmen' includes every person who is engaged in an employment to which the Act applies, whether by manual labour or otherwise, and whether his agreement is one of service or apprenticeship or otherwise, and is expressed or implied, is oral or in writing.

'The Factory Act, 1895, sect. 23, provides that 'certain provisions there specified of the

Factory Acts shall have effect as if every . . . warehouse, and so far as relates to the process of loading or unloading therefrom or thereto, all machinery and plant used in that process . . . were included in the word Factory. For the purposes of enforcing this and other sections of the Factory Act, 1895, the person having the actual use or occupation of a . . . warehouse, and the person so using any such warehouse, shall be deemed to be the occupier of a factory.'

The Acts of Parliament do not contain any definition of the word 'warehouse,' but I am of opinion it includes not only warehouses at docks, but all warehouses used for storage of goods for sale, and warehouses attached to stores and shops, particularly if plant and machinery, such as a crane and gas-engine is used for loading or unloading goods. The word 'plant' has been defined by the present Master of the Rolls in the case of *Yarmouth v. France*, L. R., 19 Q. B. D., p. 647, decided in the Court of Appeal to include whatever apparatus is used by a business man for carrying on his business."

**** OUR ALMANAC.**—According to our usual practice we shall shortly issue a *Gardeners' Chronicle* Almanac for the Year 1899. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and allied Societies, or any of our correspondents, will send us immediate intimation of all fixtures for the coming year.

BEGONIA GLOIRE DE LORRAINE AT HIGHBURY.—Enough has been said from time to time in the *Gardeners' Chronicle* to enable its readers to form an idea of the scale on which first class horticulture is carried on at Highbury, the residence of the Right Hon. JOSEPH CHAMBERLAIN. The corridor, a long and commodious structure at this place is interesting and picturesque at all seasons, owing to the quantity of choice flowering creepers and other plants. Among the many subjects to be seen in bloom recently was *Begonia Gloire de Lorraine* (fig. 127), almost filling one of the houses, the plants being mixed with *Asparagus plumosus*, *Lygodium scandens*, and *Adiantums*. Mr. DEACON cultivates this variety of *Begonia* in pans of small dimensions, and allows the shoots to hang over the sides, and without any aid from sticks or ties. *Begonia Gloire de Lorraine* requires to be grown constantly in heat and in peaty soil, and a small quantity of loam and sand sufficient to make the soil open, and the cuttings are struck in the month of April and May. *G. Burrows*, *The Dell*, *King's Norton*.

LINNEAN SOCIETY OF LONDON.—December 1, 1898.—Dr. A. GÜNTHER, F.R.S., President, in the chair. The minutes of the last meeting having been read and confirmed, the President alluded to the death of Professor ALLMAN. He was an earnest and successful investigator of the fauna of British marine Invertebrates, and his contributions to our knowledge of Freshwater Polyzoa and Gymnoblestic Hydroids, although published respectively forty and twenty-five years ago, are still used as standard works. But it is on nearer and more personal grounds than we claim to give expression to our sympathy. Professor ALLMAN occupied the presidential chair of the Linnean Society for seven years, from 1874 to 1881; and even after he had retired from the central sphere of the scientific world to the quiet pursuits of a country life, he continued to show his friendly regard for the Society by making valuable additions to our library, and by presenting us with the admirable portrait, which is one of the ornaments of this room. That portrait will remind many of those who are present to-night of the honest face, of the genial, yet manly ways which gained to him the confidence of all who came in contact with him.

Professor J. B. FARMER exhibited and made remarks on some Galls on the roots of *Agrostis alba*, and with the aid of lantern-slides demonstrated their mode of formation and development.

Mr. J. E. HARTING exhibited photographs of wild goats from certain islands of the *Ægean* Sea, with the object of throwing light upon the question of their specific identity. The president referred to the small amount of change that had taken place between the wild and domesticated breeds of goat, and to the fact that feral individuals, Irish and Welsh, sometimes developed horns approximating in size and character those of the wild type.

Mr. THOMAS CHRISTY, F.L.S., exhibited a living plant of *Begonia venosa*, Skam, which had been raised from seed procured by Prof. LÖFGREN on an island near Fara, and pointed out some of its peculiarities.

Mr. R. H. BIFFEN read a paper on the "Biology of *Agaricus velutipes*, Fr." Pure cultures of this fungus were grown on blocks of sterilised Horse Chestnut-wood kept moist with wads of cotton-wool soaked in water, under varying conditions of aëration and illumination. Four weeks after infection minute sclerotia were produced analogous to those found in some other species of *Collybia*, e.g., in *C. tuberosa*. From these one or two sporophores were formed directly, similar, except in size, to those found in Nature. They dry up in a week or two, and appear to be dead, but then produce a second crop of sporophores, which may in turn produce others, either from the pileus or stipes. It is therefore suggested that the great reduction in the sclerotia is to be correlated with this mode of vegetative reproduction, the sporophores themselves being able to function as sclerotia under certain conditions. On tracing the development of the sporophore, it was found that the gills were exposed from the first, and that the only approach to the formation of a *velum parziale* was afforded by the hairs of the recurved margin of the pileus pointing towards the stipes. It is thus completely gymnocarpic. A "conducting-system" was found running through the stipes and lower part of the pileus into the gills, where it ended in bulbous dilations, or in the cystidia. The hyphæ of the cortex of the upper part of the pileus turn outwards, and give rise to three distinct sets of hairs. As no evidence could be found for the formation of mucilage by these, it was suggested that the sliminess of the pileus is due to a quantity of water being held among them by capillarity. Microscopic examination of a series of infected blocks showed that the mycelium first formed in the wood-elements became broken up into oidia, which quickly germinated, and so gave rise to a large mycelium. The destruction of the wood is due to the corroding out of definite tracts in the cellulose walls of the thickening layers of the wood elements. The lignin of the middle lamella is left unaltered even in much-diseased wood. If, however, xylose-yielding substances are extracted from the blocks before infection, the lignin is attacked; although if the extracted blocks are treated with a dilute solution of cane-sugar, the hyphæ again attack the cellulose only.

—The next meeting of this Society will be held on Thursday evening, December 15, at 8 p.m. precisely, when the following Papers will be read:—Mr. H. J. ELWES, F.R.S., F.L.S., "Sketch of the Zoology and Botany of the Altai Mountains." Mr. THOMAS SCOTT, F.L.S., "A Description of some Marine and Freshwater Crustacea from Franz-Josef Land, collected by Mr. W. S. BRUCE, of the Jackson-Harmsworth Expedition." Exhibitions: Capt. JOHN MARRIOTT, Two rare Crustaceans from the Sinai Peninsula.

THE FELLOWSHIP OF THE ROYAL HORTICULTURAL SOCIETY continues to increase. Including those elected on Tuesday last, there have, we understand, been 600 new names added to the roll during the year now closing.

LÆLIAS AND CATTLEYAS.—Professor HENSLow, on Tuesday last, in his lecture at the Drill Hall, drew attention to the many points of similarity that exist betwixt *Lælias* and *Cattleyas*, and to the ease with which they have been crossed with each other. The fact that in one case there are four pollen-masses, and in the other eight, was not considered sufficient to justify a generic difference in the classification.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Scottish Horticultural Association, through their Treasurer, Mr. A. MACKENZIE, have forwarded a donation of £15 in aid of the funds of this institution.

"THE BOTANICAL MAGAZINE."—The volume for 1898 has been dedicated by Sir JOSEPH HOOKER to our valued correspondent, Mr. W. BOTTING-HEMSLEY, F.R.S., who, it may be remembered, contributed several articles relating to the history of this publication in our own columns, p. 389, vol. xix., and p. 651, vol. xx., 1896. The dedication is in the following terms:—

To WILLIAM BOTTING HEMSLEY, F.R.S., F.L.S.,
Principal Assistant, Herbarium, Royal Gardens, Kew.

MY DEAR HEMSLEY,—I have three reasons, each sufficient, for offering to you the dedication of a volume of the *Botanical Magazine*, firstly, as a record of the interest you have shown in this work, and an acknowledgment of the valuable aid I have received from you in conducting it; secondly, the amount and importance of your labours in systematic and geographical botany, as especially evidenced by your great works on the *Flora of Central America*, and on the *Botany of the "Challenger" Expedition*; and lastly, my wish that you should accept this dedication as the tribute of a friend to a collaborator for upwards of thirty years in the Herbarium of the Royal Gardens.

Believe me, with esteem and regard, faithfully yours,
J. D. HOOKER,

The Camp, Sunningdale, Dec. 1, 1893.

SCIENCE AND LABOUR.—Sir JOSHUA FITCH, speaking recently at the annual distribution of prizes and certificates at the Norwood Technical Institute, West Norwood, said, as reported in the daily press, that every kind of labour had some kind of science at the root of it. It was rather a disgrace to an intelligent man to be every day handling materials, the properties of which he had never taken the trouble to examine, the history of which he knew nothing about, and the capabilities of which he could never understand without some kind of scientific knowledge. He was delighted to see that a feeling had now grown up among the English people, that it was absolutely essential that we should have a thorough scientific training if we were to hold a high rank among the nations in the department of industry.

GEORGE BENTHAM.—The December number of the *Annals of Botany* contains a portrait of this most eminent botanist, together with a sympathetic account of his career, from the pen of his colleague and life-long friend Sir JOSEPH HOOKER.

DR. KARL FREIHERR VON TUBEUF, of the Munich University, has been appointed Director of the Botanical Section of the Biological Department of the Imperial Sanitary Office, Berlin. The post vacated at Munich by this transference of Dr. von TUBEUF will be filled by Dr. J. E. WEISS, Professor in Friesing, and Instructor in Botany at the Royal Academy of Knowledge in that city.

THE CHELSEA PHYSIC GARDEN.—At a meeting of the Royal College of Physicians, held on Dec. 1, and reported in the *British Medical Journal*, a Report of the Committee on the Charity Commissioners' scheme for the Physic Garden at Chelsea was read. The scheme proposed the maintenance of the garden, the provision of laboratories, of facilities for instruction, and the appointment of a curator. It proposed also to appoint a committee of management, consisting of fifteen persons, of whom eight would be appointed by the trustees of the London parochial charities, one by the Royal Society, and one by the Royal College of Physicians and the Apothecaries Society alternately. Dr. HEMSLEY proposed to reply requesting that the Royal College of Physicians and the Society of Apothecaries, which had maintained the garden for many years, should have the same representation as the Royal Society. The President (Sir S. Wilks) observed that the gardens had been founded by a former President of the Society, Sir HANS SLOANE, and that it seemed only proper that the College should have a permanent representative on the committee of management.

STOCK-TAKING: NOVEMBER.—The balance of the foreign trade account, it is pleasant to note, continues on the right side. The excess over the same

period last year in both imports and exports may not be great, but there is "something to the good," the mysterious ways of diplomacy notwithstanding. As to the—

IMPORTS.

The Trade and Navigation Returns for November place these at some £42,069,569, against £41,166,146 for the month of November, 1897—or a gain of £903,423. Our usual excerpt from the "summary table" for the month is as follows:—

IMPORTS.	1897.	1898.	Difference.
Total value ...	£ 41,166,146	£ 42,069,569	£ +903,423
(A.) Articles of food and drink—duty free ...	14,312,833	14,532,379	+2 9,546
(B.) Articles of food and drink—dutiable	2,819,912	2,843,111	+23,199
Raw materials for textile manufactures ...	7,829,327	7,805,385	—23,942
Raw materials for sundry industries and manufactures	4,078,164	4,127,950	+49,786
(A.) Miscellaneous articles ...	1,491,941	1,637,147	+145,206
(B.) Parcel Post ..	106,957	97,367	—9,590

The vagaries in the various sections may be briefly noted as follows:—In manufactured articles, machinery figures for an increase of over £200,000—an increase which we do not admire. Wheat, principally supplied by the United States and Canada, has been less by £1,214,552—or 2,115,050 cwt. On the other hand, Barley from Russia and Roumania show an increase of 1,499,400 cwt., of the value of £432,941. Maize from Argentina and the United States of America gained by 1,834,640 cwt., the value of £418,184. Bacon and hams went up by £230,449. Concerning sugar, the imports from France fell off very much (Nov., 1898—5,960 cwt.; 1897—409,371 cwt.), but those from Germany showed a marked increase (Nov., 1898—436,635 cwt.; 1897—443,811 cwt.). Coming now to dutiable articles, the figures, £121,504, denote the increase in imports of wine. Cocoa shows an increase of £48,383, and Coffee a decrease of £68,997. Manufactured copper increased by £105,222, but tin was less by £30,330. It is worthy of note that cotton went up by £276,213, hemp by £115,926. Wool, however, from Australia, was less by £327,599; india-rubber, increased by £302,350; gutta-percha by £36,913. Timber fell off by £405,766. In seed, Flax jumped up by £150,936. Now, as to the eleven months' imports, we find them valued at £425,346,792, against £409,832,201 for the corresponding period in 1897—an increase of £15,514,591. At this season of the year, "when the song of the grocers is heard in the land"—an increase in our little table of imports of fruit, roots, and vegetables, is very permissible, and is as follows:—

IMPORTS.	1897.	1898.	Difference.
Fruits, raw:—			
Almonds ... cwt.	27,444	36,151	+8,707
Apples ... bush.	783,300	311,786	+28,488
Grapes ... "	122,341	199,470	+79,129
Lemons ... "	116,168	109,122	—7,046
Nuts ... value	£89,294	£157,183	+£67,894
Oranges ... bush.	621,475	742,718	+121,243
Pears ... "	46,674	47,092	+418
Plums ... "	884	1,194	+310
Unenumerated, raw "	63,670	108,804	+45,134
Onions ... "	485,530	665,631	+180,101
Potatoes ... cwt.	834,005	130,680	—703,325
Vegetables, raw, unenumerated ... value	£63,041	£112,612	+£49,571

Add to these the enormous stores of Currants, Raisins, candied peel, and spices, and we arrive at the conclusion that, with the exception of Potatoes, the figures are very satisfactory for Christmas-keeping folks; and taking them in connection with the imports of poultry from all the usual sources of supply, promises a grand total of these delicacies (!) which go to make up good cheer for the million amongst the juveniles, and employment for the medio. And now, and finally, as to the—

EXPORTS.

The total for November is summed up in £19,820,207, against £19,773,594 for the corresponding period in last year—an increase of £46,613—a mere "bagatelle," but better than nothing. It is well worth noting that the engineers are doing their best to make up for the strike loss—the increase in machinery and millwork footing at £487,636; and coal shows an enhanced value of £294,214. Iron manufactures fell away by £324,576—copper going up £56,408. There is a gain in miscellaneous articles—£89,425. As to the tale for the eleven months, there is a decrease of £2,635,438—the figures for 1898 being £212,412,384, against £215,047,822 for 1897. As a concluding remark, the working of the Canadian Preferential Tariff is favourably reported on by the Dominion authorities—the gain being perceptible on both sides of the Atlantic.

A GREAT GRAPE CLASS.—The conditions attached to the great International Grape class at Shrewsbury, which will be published in the Shropshire Horticultural Society's schedule for the exhibition in August next, have, after much general criticism, been settled definitely, and the large sum of £100 has been divided into six prizes of the value of £26, £24, £20, £15, £10, and £5; but the committee will instruct the judges that, should there be exhibits beyond these of worthy nature, to make two other lesser awards, or practically to award eight prizes. These latter might suffice to cover expenses, if they did nothing else. The class is for twelve bunches, in six varieties, and each pair of bunches must be placed on single boards; then, because the table-run is restricted, the boards will have to be ranged in two tiers, the tables being specially constructed for that purpose. Besides this, for the first time at Shrewsbury in connection with a purely Grape class, small foliage plants and loose or draping foliage will be used to give pleasing decorative effects, but flowers may not be employed. In making awards, judges will be required not so much to consider flavour (as that element, so early in the season, may not be fully developed) as the evidence furnished in the bunches of superior cultivation and finish, which it is hoped will include proper thinning, size, and evenness of berry, contour of bunch, colour, and bloom; mere size or weight of bunch being of very secondary importance. Altogether this remarkable Grape class should bring together for once the finest Grapes the world can produce.

DURHAM, NORTHUMBERLAND, AND NEWCASTLE-ON-TYNE BOTANICAL AND HORTICULTURAL SOCIETY.—We are requested by Mr. J. B. REID, who has succeeded Mr. J. J. GILLESPIE, Jun., in the secretaryship, to state that the offices of the society have been transferred from Cross House Chambers, 54, Westgate Road, to Mosley Chambers, 30, Mosley Street, Newcastle-on-Tyne.

THE FATE OF AN INTERESTING GARDEN.

That enthusiastic gardener, Mr. GEORGE WILSON, of Heatherbank, Weybridge, writes:—"A very eminent scientist, who recently died at Parkstone, near Bournemouth, had been for some years a devoted and successful gardener, and had a collection of very interesting and rare shrubs, which flourished in the mild climate of the district. It was a great pleasure to see him in his garden, and at the age of 86 he remembered most of the names without having to refer to the labels. A great traveller and author, also a very successful gardener, who lives close by Ardmore, writes me, 'Dr. ALLMAN'S house and garden will soon be for sale; try and get some good gardener to buy it, it is full of rare and fine things.' To any old gardener wishing for a nice house and attractive garden in a mild climate, this would give a good chance, and to my friend a congenial neighbour."

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—The Floral Committee of this Society awarded at the meeting on November 9, 1898, First-class Certificates to Mr. Jac. C. Groenewegen, of Amsterdam, for *Chrysanthemum* Edwin Bethge, G. Madame Boudoin, C. Madame H. de Vilmorin, C. Mrs. T. A. Compton, and C. The Egyptian. To Mr. T. E.

Houtvester, of Utrecht, for C. Edwin Bethge, C. Mr. H. Tukker, C. Sarnian Gem, and C. Yellow Madame Carnot. To Mr. A. P. Bouwman & Son, of Arnhem, for C. Yellow Madame Carnot. To Messrs. E. H. Krelage & Son, of Haarlem, for Cactus-Dahlia Casilda, C.-D. Henry Ayres, C.-H. Laverstock Beauty, C.-D. Miss Finch, C.-D. Royal purple, C.-D. Stella, and C.-D. W. F. Frost. To Mr. W. C. Baron van Boetzelaer, of Maartensdijk, for Staurosis lissæchiloides. A Certificate of Merit was granted to Messrs. E. H. Krelage & Son, of Haarlem, for Cactus-Dahlia Octopus and C.-D. Pumila; and a Silver Medal was awarded to Mr. J. G. Ballega, of Leiden, for a collection of *Cattleya labiata autumnalis*. H. C. Zwirt, Secretary.

THE PRINCELY GARDENS AT SCHLOSS DYCK.—The celebrated collection of plants at this place which owed its existence to that famous and learned lover of plants, the late Prince JOSEPH SALM, has been scattered, and Herr Hernies, the gardener who had the care and management of the gardens for twenty-seven years, is to be pensioned in April next. He will be succeeded by Herr Xaver Rohde.

OUR FOREIGN FRIENDS.—In the 20th number of *Le Chrysanthème*, although dated October, is a brief report of the great Chrysanthemum exhibition at the Aquarium from November 8 to 10. M. SALÈTES, it appears, was a welcome guest, as every horticulturist, of whatever nationality would naturally be on such an occasion. M. SALÈTES expresses his surprise at the cordiality of his reception. It would greatly conduce to the advantage and pleasure of all concerned if more of our French colleagues would do us the honour of paying us a visit. They would find, that so far from entertaining any hostile feeling, the people of this country have no stronger wish than to be on good terms with their neighbours, whilst so far as horticulture is concerned, the distinctions of nationality are hardly more recognized than in the case of science, which NAPOLEON is reported to have said, has no nation. Mr. HARMAN PAYNE seems to have acted the part of a patriotic Englishman in extending the hospitality of the Chrysanthemum Society to M. SALÈTES.

BRITISH WEIGHTS AND MEASURES are used by some 113 millions of people in Great Britain and Ireland, Canada, Australia, Cape Colony, New Zealand, and the United States of America; and the time, money, and patience lost to that enormous number of human beings, most of whom esteem themselves rational, is simply incalculable. The 329 millions of people who habitually use metric weights and measures save time in all their calculations; they also save trouble through being able to perform mental calculation more easily; and the interrelation of their standards affords them a great advantage over us. *Pharmaceutical Journal*.

PRICKLY PEARS IN NEW SOUTH WALES.—A recent issue of the *Agricultural Gazette of New South Wales* contains an important paper, with numerous illustrations, by J. H. MAIDEN, on the "Prickly Pears Naturalised in the Colony." The subject is briefly summed up thus by the author:—"The principal indictments against the Prickly Pear are: 1. It frequently occupies good soil. 2. The profusion of spines of some species, which prevent cattle browsing on it, or man dealing with it, the plants thus become a harbour for vermin. 3. The abundance of seeds it produces, which, being eaten by birds and animals, are disseminated through their agency. I have heard it stated that imperfectly-ripe fruits are a far more certain source of reproduction than perfectly ripe ones. 4. The vitality of the plant. When joints are broken off they readily take root in most parts of the colony during the greater part of the year. Having said all the harsh things we can against the Prickly Pear, let us see what we can say in its favour: 1. Some species can be utilised as food for stock. 2. Some species yield fruit, of which many people are fond. They should be gathered with gloves, and the bristles rubbed off with a napkin. 3. Some species form fire-proof and cattle-proof hedges. In some parts of the United States

they are used to fence in railways. 4. They are very desirable for horticultural purposes, both for rockeries and for scenic effects in gardens generally." The various species alluded to above are *Opuntia ficus indica*, *vulgaris*, *tuna*, *monacantha*, *stricta* (inermis), and *brasiliensis*. None of them is indigenous, but having been introduced at different times, they have flourished and increased to an enormous extent, so that the mischief caused by them far outweighs their value. The importance of the question may be gathered from the rigour of the Prickly Pear Act, under the provisions of which, "a citizen failing to comply with the regulations is liable to a fine of £20." Total eradication of the pest by burning or deeply burying it is required, and has been tested; while, as an alternative, puncturing and spraying the plants with "scrub exterminator" powder has been tried. For details of these experiments reference must be made to the *Gazette*, where, in the paper under discussion many interesting facts are given of the history of the *Opuntias* in the colony and elsewhere, together with several good illustrations.

"LIVE STOCK JOURNAL AND ALMANAC" (9, New Bridge Street, Ludgate Circus).—An annual, indispensable to the breeder of horses, cattle, and stock generally.

THE PRINCIPLES AND PRACTICE OF BULB-GROWING.

(Continued from p. 422.)

A VERY interesting and useful method, which is adopted in the propagation of the Hyacinth, consists in making two or three longitudinal slits across the under-side of the bulb, i.e., in the rudimentary stem, after removal from the ground. When placed on the shelf to dry, it is not long before numbers of tiny young bulbs are formed at the margins of each slit. Another means employed for gaining from each bulb a much larger number of offspring than is produced by nature in the soil, is that of scooping the bulb on the under-side, so that a large bowl-like cavity is formed, lined with the cut transverse surfaces of the fleshy scales. At the margins of these surfaces sprout very numerous young bulbs of very small size, representing so many tiny individual plants; these are all separated and grown apart in the autumn. It is well to study the *raison d'être* and learn the biological significance of the production of young bulbs by these processes.

When a plant or part of a plant is wounded in any part of its tissues, it immediately sets to work to heal the wound which has been made; and this is effected by renewed growth on the part of the tissues immediately adjoining the injured part, so as eventually to cover over the wound by a protective callus. Some plants, but by no means all, have the power of producing, under certain conditions, offspring from nearly every organ, especially from the leaves; the instances of some Ferns, Begonia, *Curculigo* (fig. 128, p. 443), *Streptocarpus*, occur to us. If an incision be made in a detached leaf of a Begonia lying on damp soil or sand,

an entire new plant or plants will be formed at the margin of the incision. Numerous cases of natural adventitious budding will occur to us. This same power is possessed by bulbous plants. We have already seen how entire new individuals may be formed from ordinary branches of the stem in the ordinary natural method of bulb-propagation (see illustration of *Narcissus*, fig. 129, p. 443). That is a not uncommon phenomenon, for we know that very many plants have the power of forming new individuals from their branches or portions of their stems, as in cuttings. In the first-named slicing method of Hyacinth propagation, it is the stem which is chiefly affected, hence we see here a case of adventitious budding from the stem of the same nature as the phenomenon of multiplication by means of cuttings. In the second-named method, however, that of "scooping" and "notching" (see figs. 130, 131, p. 443), it is the foliar organs, the scales, equivalent to ordinary foliage leaves, which are affected, and hence we find here the same phenomenon of the production of new individuals from the leaf as in the Begonia, for the tiny bulblets are formed all round the cut edges of the scales.

Now, in all these cases of adventitious budding, as the result of wounding in some way or other, the energy which in ordinary cases of wounding is used solely and simply for the healing of the injured part by the formation of the simple callus-tissue, is in those cases which we have had under consideration, as well as in others, directed towards the building up of a new individual, with all its complex, differentiated tissues. For these cases are generally those of fatal wounding of the plant or organ, in which the possibility of renewed life and growth is precluded for ever. And then the instinct of the plant asserts itself in the endeavour to create a numerous progeny capable of continuing the thus violently interrupted life-cycle—just as the production of great quantities of spores is induced in many fungi and algæ when unfavourable outward conditions prevent a continuance of their normal vegetative growth. Very fortunate and convenient for the bulb-grower is this habit of economy and desire for offspring on the part of the plant.

This same faculty in the plant of producing new individuals from the vegetative organs by adventitious budding is seen in some of the Lilies (see fig. 132, p. 443). We used to propagate *Lilium auratum*, the beautiful Japan Lily, in part, by pulling some of the bulbs to pieces and sowing the separate scales in sand, for each scale is capable of producing a new plant from its injured basal end, when thus detached and isolated from the bulb; offering, in fact, a similar instance to that of the Begonia and *Streptocarpus*-leaf, and compensating, by this rejuvenating process for the entire destruction of the parent bulb.

The main reasons for the annual removal of the bulbs from the soil, and storing them until the planting season again recurs, are the following:—The young bulbs can then be detached and sorted from the others; the bulbs are secured thereby from the dangers of mice, and from accident from rain or drought; the decaying or unhealthy scales and roots can be removed, allowing a freer circulation of air, and freedom from infection by bacteria to the remaining parts of the bulb, and a longer rest and respite from growth is allowed to the bulb than they would get if left in the ground, and have a likelihood of their more profuse flowering next spring.

A method of cultivation of Hyacinth-bulbs,

familiar to every lover of flowers, demonstrates clearly the nature and function of the "bulb" as the storehouse of all the food substances necessary for the production of the leaves and the flowers. This is the practice of growing the bulbs in glass vases of water, so that the latter just bathes the base of the bulb, when long roots can be seen growing out and downwards through the transparent liquid. The uninitiated will sometimes wonder, doubtless, how the bulb can thus throw up leaves and flower-spikes without any soil around it, being acquainted

salts in solution which are needful for the growth of the flower and foliage. So far, however, and no further, can this pretty method of water-culture proceed. For the permanent growth of the bulb under such conditions would be impossible; because the water, unless it were specially prepared for the purpose, cannot supply all the requisite salts so essential to the plant, which are found in the soil. If sufficient skill, labour, and patience were afforded, however, water-culture would be quite possible; at least, for a certain length of time, as an

HOME CORRESPONDENCE.

ORCHARDS ON GRASS.—That there are grasses and grasses, as well as trees and trees, for orchards, is well known to experienced cultivators. It would be going too far to affirm that the selection of the grasses was of equal importance to the choice of the trees; though most growers will agree with "F. R. H. S.," on p. 377, that the character of the grass is of great moment. The grass virtually, in fact, feeds at the same table as the trees. Surface-rooting grasses thus compete for food with the roots less directly and less strongly than deeper-rooting grasses. The so-called natural grasses—that is

FIG. 132.—NEW BULBS ARISING FROM A BULB-SCALE OF LILY.

with the fact that bulbs are usually grown under the garden-mould. But to the interested grower who understands something of the common laws of plant-life, and the functions of the various organs of a plant, before commencing the attempt of the successful cultivation of an organism like a bulbous plant, the case is fairly simple, and easy of explanation. For the bulb contains within its own thick fleshy scales nearly all the nutriment necessary for the development of the aerial flowers and leaves, whose rudiments are already laid down within the heart of the bulb. The roots supply the water, which will also contain a few of the

interesting hobby and experiment; but for all practical purposes it would be useless, and is quite contrary to Nature.

In conclusion, I would say that bulbous plants, like other members of the vegetable kingdom, are to be treated under cultivation in accordance with their peculiar organisation, structure, and habits, and I am convinced that the perfection of horticulture will alone be attained when an interested and familiar knowledge of the structure and life-histories of plants is united to a thorough and practical acquaintance with their treatment in the garden under cultivation. *W. C. Worsdell.*

those which spring up spontaneously, or thrive so well under given conditions as to over-run or smother out all others—furnish useful data as to the physical characteristics and productive capacities of soils, and useful hints to the cultivator. Though, for the nonce, the planting of orchards on grass is out of fashion, this time-honoured practice may be revived, and is likely to be so when as much attention is devoted by our seedsmen to the selection of grasses for orchards as for forming garden lawns. The "velvet-pile" of the latter is far more difficult to maintain as a profitable green surface-rooting sward under our fruit trees of moderate and uniform growth. But the future treatment of the turf or grass of orchards is hardly of secondary importance to the selection of the grasses for laying its solid and lasting foundation. No one doubts the truth of the

well-worn proverb, "All work and no play, makes Jack a dull boy," and yet all taken out and nothing put in is the true epitome of the management of many an orchard under grass. A heavy crop of hay, perhaps an aftermath of considerable bulk, and besides, a crop of fruit from the trees, such is the burden year by year. In my technical lectures on "Fruit Culture," nothing seemed to astonish the audiences so much as to be told that Apples, Pears, Plums, Cherries, all fruits, needed to be fed as well as ourselves, if they were to live long in good health and in full fertility. As a result of some of these lectures, it was hopeful and yet almost pitiful to find a forkful or two of dung placed firmly against the bole of the trees as a nose-bag of corn over a hungry horse's head. Shortly after I was challenged to an out-of-door demonstration to prove that no food was wanted for fruit trees. This was in a Plum Orchard on grass, mostly Green Gages, perfect models of cleanliness, health, and fertility. The grass was green, even short, almost as that of a well-kept lawn, proclaiming itself sheep-fed to all who had eyes to see. On inquiry it was found that no one had seen this orchard under hay, nor even mown for green fodder. It was simply and constantly fed throughout the season, and there had been few days in the year when a sweet bite under the Plums could not be had for the sheep or early lambs. And the droppings of this well-conditioned flock were almost more than sufficient to feed the Plum-tree. My opponents had simply given their case away, and the top-dressings of orchards on grass began to multiply in number and expand in area. Still, with fruit trees with clear stems of 5, 6, or more feet high, and grass enough to satisfy the stock, there is nothing within the range of natural and artificial manures to equal in potency and efficiency a flock of sheep. The more in reason for a given area the better; for it is not so much the grass that injures the roots of the trees as the length of it. Hence, on no consideration should grass orchards be mown for hay; this not only impoverishes the ground, but cools, and not seldom sours it. We can compensate our orchards for the loss of our hay crops, but we cannot make up for the loss of light, air, and warmth through this overshadowing of the land by long grass; but on fully-stocked meadow land of good quality, very fine Cherries, Apples, Pears, and Plums can be grown. The great difficulty with large stock is the cost of tree guards; and another more modern difficulty is the danger to stock of spraying the trees, and, consequently, the herbage, with more or less poisonous insecticides and fungicides. When the cost and risks of both are duly considered, most planters will probably continue to prefer arable orchards of standard trees, with fruit bushes, Rhubarb, Strawberries, or light crops, say, of Lettuces, underneath the trees as being pleasanter and more profitable than those under grass. *D. T. F.*

NOTES FROM ISLEWORTH.—The season of 1898 has been remarkable for the terrible drought which began early in July, and lasted without any real break until the middle of October. The only permanent evergreens that withstood this period without showing signs of distress were the Cedars in general, *Pinus excelsa*, the Yews, Hollies, and Pampas-grasses. I believe that great injury has been done throughout this district to *Sequoias*, *Retinosporas*, and even Lawson's Cypress, and that the full extent of this damage cannot be judged until next springtime. There was generally a fine show of bloom on fruit-trees, but three days of continuous gales, snow, and rain, at the end of March, ruined the Apricots and damaged the Peaches. Blight and woolly Aphis abounded during June to an extent which I have never previously experienced. Such a season is, of course, unfavourable for any kind of gardening, and many exotic bulbs, which as a rule flower well with me in August and September, have failed to a large extent. *Lycoris squigigera* only produced about eighty flowering-spikes, or fewer than half the usual number; and *L. aurea* and *L. sanguinea* failed to produce any perfect flowers. The *Brunsvigias* were also very chary in flowering this summer, and the only genus which really did well was the *Amaryllis*. These flowered against an unheated garden wall, although I have often heard it stated that they will not flower in such positions in England except on the south coast. In the glasshouses, the year has not been very eventful. One magnificent *Crinum*, allied to *C. submersum*, flowered for the first time, but I find the whole of this section (the American "Ornææ," of which *C. scabrum* may be taken as the type) are difficult to cultivate. Among other rare *Crinums*, *C. pauciflorum*, and *C. fimbriatum* also flowered.

Placea ornata has been successfully established, and it flowered freely. *Hæmanthus puniceus* wintered unprotected at the base of the stove-house wall outside, and flowered very well about midsummer. I was also much interested in flowering the old *Hæmanthus callosus*, not that it is in any way beautiful, but because it was one of the bulbs cultivated by Burchell early in the century; and, from a gardener's point of view, there seems to be almost an historic interest in the re-introduction of these old treasures. Two small bulbs recently re-introduced to Kew from Uruguay, also flowered here this year—*Brodiaea* (*Triteleia*) *aurea*, and *Herbertia pulchella*. It is only when one possesses an ample stock that experiments are tried as to the degree of frost that will damage exotic plants. Among the *Amaryllideæ* I have found Old World species to endure several degrees more cold than those from similar latitudes in the New World. This year I left *Crinum Moorei*, *Brunsvigia* (in two species), and *Hippeastrum aulicum*, bedded out until late, and while their flowers were, in every instance, expanded, they withstood a night temperature of 32° (in the air) without any injury to the flowers expanded at the time. But this, I think, must be near the limit, because in other years I have had *Brunsvigia* in flower cut down by very few degrees of (air) frost, and *C. Moorei* also. On April 23 bedded *Cinerarias* in flower were not injured by a night temperature of 30° in the air. *Campanula pyramidalis* wintered outside unprotected and uninjured, and also several specimens of the Tree-frog from the Mediterranean regions. *A. Worsley, Isleworth, November, 1898.*

TOMATOS TRAINED SPIRALLY.—The cultivation of the Tomato is similar to all other branches of horticulture, seeing that the observant cultivator can always acquire a certain amount of knowledge regarding the best methods to be pursued with the plants. Each year brings new varieties, something new in methods of cultivation, some to be regarded as improvements, and others discarded as being useless or detrimental. My wish in the present communication is to explain some experiments made at Wrest Park during the past season with Tomato plants out-of-doors. The chief object was to show that the Tomato can be grown successfully in a garden border, or similar situation, without assistance from a wall. The plants, when trained spirally, do not grow so fast, the flow of sap being somewhat checked, and directed to the fruits. Another advantage this sort of training affords is, that towards the end of the fruiting season the cultivator will have fewer green fruits to ripen off indoors than under the old method. The two varieties experimented on during the past season were *Superam* and *Early Prolific*, both of which were raised from seeds sown at the same date, and planted out in their summer quarters on May 15, many of them being planted against the east, west, and south walls of the kitchen garden; and the remainder in the border away from the walls. Those planted in the open received support from fine stakes, and the training began with the first tying of the plants. During the summer the plants, one and all, received the same kind of treatment in regard to affording water, tying, nailing, and the pinching of lateral shoots. Towards the end of August a finer crop of Tomatos, grown in the open border, could not be desired; and those who saw the plants said that they had no idea that the Tomato was so productive without any aid from a wall, far surpassing those in the weight of the crop of fruit. *George Mackinlay, Wrest Park.*

HONOURS TO FRENCH HORTICULTURISTS.—I read in the *Gardeners' Chronicle* of November 26, that "Mr. Pinoteau has been created a Chevalier of the Ordre du Mérite Agricole for his services to horticulture, the honour coming to him upon the recommendation of the Minister of Agriculture of the Republic of France. It is the first time in history that this decoration has been bestowed upon a Frenchman whose work has been accomplished out of France." I wish to correct this mistake, as Mr. Schneider, President of the French Horticultural Society of London, obtained this decoration in the year 1896, for the same kind of services. *O. M.*

RIVINAS.—In the issue of the *Gardeners' Chronicle* for Dec. 3, Mr. H. H. Thomas, under the heading, "Some Neglected Greenhouse Plants," mentions, amongst others, *Rivina humilis* and *R. tinctoria*, and states that they would not be suitable for either house or table decoration, but for summer decoration in the conservatory. *Rivina tinctoria* I do not grow, but *R. humilis* is an excellent decorative plant for apartments and dinner-table. I grow it chiefly for

use in the winter season, and when it is not convenient to place the plant in its pot on the table, the branches are cut off and placed in little vessels filled with water or damp sand. Associated with well-coloured autumn leaves and sprays of *Ampelopsis Veitchii*, the effect is very pleasing. The plants thus cut down are grown on in the spring for forming large specimens. They are, as Mr. Thomas says, easily raised from seed; in fact, plenty will come up themselves if the mother-plants are stood on gravel or sand. Sudden changes of temperature should be avoided during growth, or loss of foliage will result. *Geo. E. Parr.*

BEGONIA GLOIRE DE LORRAINE.—I am not surprised that your correspondent, Mr. Grace, was struck with the beauty of the *Begonia Gloire de Lorraine*, exhibited by Mr. Allsop, gr. to Viscount Portman, at the Blandford Chrysanthemum show. This lovely plant will probably be a great favourite when better known. Too much cannot be said in praise of the *Chrysanthemum* as now exhibited, yet I think most persons will admit that masses of this flower shown quite unrelieved by any other, are just a little monotonous. Now this *Begonia* is just what is wanted as a contrast, and by careful management the plant will flower throughout the autumn and winter months. Nothing can exceed the beauty of the 300 plants in bloom in one large house in Bryanstone Gardens, each plant a perfect specimen, covered with graceful sprays of bright pink blossoms, relieved by the delicate green of the leaves. I have no doubt Mr. Allsop will be very pleased to show his plants to anyone wishing to see them. *H. Dudderidge, The Dorset Nurseries, Blandford.*

RAINFALL EAST AND WEST.—Anyone who has noticed the meteorological reports during the past few months must have remarked the wide difference between the rainfall in the east of England and the west. Here is the record at Penllergare, near Swansea, and at my own Vicarage in East Kent:—

At Penllergare.		Inches.	At We twell, near Ashford.		Inches.
August	4.89	August	1.38
September	2.19	September	0.64
October	7.94	October	2.07
		15.04			4.11

Of course I am aware that to a greater or less extent there is always this difference; but few, I think, are aware how great this often is. *Wild Rose.*

THE CLEANING OF TOMATO SEEDS.—Like most other things, the cleaning of Tomato seeds is simple enough when you know how. The difficulty is due to the presence of a gelatinous substance that adheres to the seeds, and prevents their sinking in water. It is this substance that fills the meshes of a fine sieve. A method which I have adopted for a dozen years is as follows:—Remove the seed from the pulp to a basin by the aid of a tea-spoon, and beat it up vigorously with the fingers. Afterwards pass the mass twice or thrice through water, and finally place it in a gravy-strainer, and remove as much of the gelatinous substance as possible, holding the seeds under a water-tap, wiping away the fluid beneath as it is pressed through. At this stage the whole is a jelly-like mass, and the seed inseparable by hand. It should now be turned out on to a piece of smooth board, and spread thinly with a knife. In a day or two the watery part of the mass will be absorbed more or less, and the seed fixed to the board. The mass, when dry, may be raised by pushing a knife under it, and the seeds separated by hand-rubbing. If fruits be left to rot in a low temperature not favourable to germination, the gelatinous part decays together with the pulp, and the seeds are readily cleaned. Partially ripe fruits have much less of this gelatinous substance. *E. J.*

LADYBIRDS AND APHIDES.—I was much interested in "H. C.'s" remarks (in your issue of the 3rd inst.) respecting the ladybird. It lives almost entirely on aphids of various kinds, a fact well known to Hop-growers. The larva also live on aphids, and was very numerous on our Chrysanthemums this year. It somewhat resembles a lizard in shape, and is about three-eighths of an inch in length. I have watched the development of the larva into the mature insect: the tail becomes shorter and more obtuse, until the body is nearly round; it then fixes itself to the leaf, and finally comes out of its covering a winged insect. The colour of the wing-case is somewhat dull at first,

but it soon attains its usual brightness. There are several more enemies of the aphid, viz., the larvæ of the wasp-fly (a formidable foe), the grub of the lace-wing fly, the Ichneumon fly, and wrens, &c. We hear a good deal of the destruction wrought by injurious insects among cultivated plants, but little is said of our insect friends. *Charles Barnett, Decker Hill, Shifnal.*

CHRYSANTHEMUMS IN SCOTLAND.—To me Mr. Brotherston makes a startling announcement on p. 409, where he says—"Generally speaking, Chrysanthemums have had a bad time of it in Scotland." At the late Edinburgh show, where the leading prizes were won by Scotch growers, they never have been so fine. On all hands it was said that this has been the best season ever experienced by the Scottish growers. At the banquet, in responding to the toast of the exhibitors, Mr. Lunt, the leading Scottish prizewinner, attributed much of his success to the favourable weather Scotland had enjoyed. Certainly, I never saw in Scotland Chrysanthemum flowers of a better colour, brighter, fresher, or with such substance in the florets, as on that occasion. No exhibit could have been staged in such prime condition as were the 1st and 2nd prize stands in the great Vase Class if the season had been as unfavourable as was implied by Mr. Brotherston. Not only was this fine quality very remarkable in the classes alluded to, but throughout the show also. Never has there been witnessed anywhere such a display of the ordinary decorative varieties shown without disbudding: no fewer than seventeen exhibitors taking part in the contest for three vases of this type of flower. Plants, too, were a great improvement on recent years, being not only larger, but more freely flowered, and better furnished with healthy foliage. The blooms themselves, too, were bright and fresh-looking, showing that the shoots were perfectly matured, without which the finest flowers are unobtainable. *F. Molyneux.*

THE PURPLE BEECH.—Whatever tastes in foliage coloration may be, we should all be thankful that the chlorophyll in the leaves of our trees is green rather than red, yellow, or some other tint. Green is by far the most neutral, restful, and pleasing hue, and, so far as I can judge, the most pleasing hue for extent. What can be more lovely than a broad expanse of verdure of lively green, over which hang in rich luxuriance trees laden with foliage of darker and diverse shades of green? Not all the cocknified variegation in the world can equal that for beauty and charm. But I am far from despising the Purple Beech when it shows really good colour. A pale or greenish-purple-leaved variety is a good tree spoiled. A tree, the foliage of which is of purplish-maroon colour, and which is also vigorous and noble, is a fine feature; but, all the same, should be sparsely found. One of the very handsomest and finest, as well as deepest coloured of Beeches I have seen is on the lawn at Dover House, Roehampton, and I have thought that growing on a dry, warm, gravelly base, that such soil helped to promote coloration. Creamy or white variegated trees soon assume a tawdry appearance, especially in windy spots or near towns. A garden largely planted with variegated trees, Golden and Silver Hollies especially, all cone-shaped, variegated Conifers, Aucubas, Euonymuses, and various other distorted-leaf trees and shrubs, is a horror from which anyone with taste soon escapes. Let us have flowering trees and shrubs in abundance, plenty of natural and graceful growth, but keep the pepper-box variegated things to delight the denizens of Brixton and Clapham. *A. D.*

TIMELY PLANTING OF BULBS.—Mr. H. W. Ward is well known as an excellent gardener—one from whom I should be glad to learn on many subjects—and he can well afford to leave alone the support of a false practice by false arguments. Indeed, some of his arguments obviously make against himself. Why has he, "with very satisfactory results," transplanted Snowdrops and Narcissi in June, unless because that is the right season, and October or November the wrong one? Bulbs planted at the latter date may flower fairly well, for as I have acknowledged, they are long-suffering subjects, and patient under ill-treatment. But both seasons cannot be best. Bulbs have other work to do besides flowering, and, as it is my habit to go not by theories, but by facts, I will give Mr. Ward a proof which he will find difficult to gainsay. In the summer of 1894 I lifted a large bed of Narcissus Empress. Three of the bulbs I replanted the first week in August, and kept three of the same size and weight very carefully until the first week in November, when they were planted in the same bed with the former three, and in the same row, a space

having been left vacant on purpose. The later-planted bulbs bloomed nine days after the others, and their flowers were good, though distinctly smaller than the earlier ones. In June both lots were lifted, when the foliage showed that the bulbs were ripe. The earlier-planted bulbs had all made fine offsets of bloomings size; the others only small and scarcely detachable offsets. Both lots were again planted separately. The earlier, which I will call A, the first week in August; the later B, the first week in October. In 1896 the same thing was once more done, A being planted the first week in August, B the first week in September. In June, 1897, both lots were lifted and weighed; the total produce of A was just 2½ times as heavy as that of B. It is to be noticed that in the second and third seasons I gradually approximated the date of B's planting to that of A. If B had every year been planted in November, its final deficiency in produce would have been still more marked. This experiment supplies the answer to Mr. Ward's confident appeal to the "grand floral displays in the London Parks." The bulbs bloom; but what becomes of them afterwards? Mr. Ward must bear in mind that it is the right practice of market-growers which is under discussion, and a market-grower who is provident, and on the road to success, will do his utmost to secure not only his bloom, but the fullest increase of his stock. The quotation from Mr. Birkenshaw, that Narcissus bulbs should be planted "about the middle of October," scarcely helps Mr. Ward, for the next words are "or earlier if possible." And surely Mr. Ward is not serious in his argument, that because well-known dealers advertise Daffodil bulbs in November, therefore this is the right time to plant. It is no disparagement of a dealer to say that he has to live, and that a large number of bulbs, like the Jew's razors, are "made to sell." Daffodil bulbs can be bought to any amount in January—is January therefore the right time to plant them, or where does Mr. Ward draw the line? As he has made use of Mr. W. B. Hartland's name, let us hear his opinion on this question:—"Bulbs that are out of the soil for five or six months cannot possibly give satisfaction. . . . I therefore impress upon my customers to send their orders in August and September, and get them to mother earth early." Mr. Hartland prefaced his catalogue with these words in 1887, and I do not suppose he has changed his mind since. Messrs. Barr state that "the best time to plant to obtain the finest flowers is September," and probably would not contradict my experience of nearly twenty years' careful observation, that for the largest increase of stock August is still better. As to the date of arrival of bulbs from Holland, I can only say that I often buy from Holland direct a thousand or two of bulbs perhaps at a time, and obtain them in August. It is merely a matter of demand and supply; buyers have only to insist upon receiving supplies at the right time to get them. A little resolute combination on the part of customers would soon produce Iris bulbs in August; indeed, I know a large cut flower market-grower who buys and plants Spanish Iris in that month. Why does Mr. Ward say that the market gardener and the (flattering epithet!) Narcissus hybridist have different objects in view? Certainly, my object is to grow every plant to the highest perfection in flower, leaf, and bulb, and if a market-gardener knows his business his object is the same. One more point: Mr. Ward hopes my Narcissus will not be damaged by frost, because their leaves are already breaking the soil. Will it surprise him to learn a fact, of which I am quite certain from the very careful observation of many years, namely, that it is the late, not the early-planted, bulbs which are susceptible of injury from frost? The reason is not far to seek: the bulb possessed of abundant, deep roots is full of strength and hardihood, and is not moved by the alternate expansion and contraction of the upper soil in frost and thaw; while the late-planted, feebly-rooted bulb has no hold of the ground, and often suffers, like a badly-anchored ship. *Geo. Engleheart.*

JUDGES AND EXHIBITORS.—The emphatic "not" at the end of "A Competitor's" note in the *Gardeners' Chronicle* (p. 372), will be welcomed by all competitors at horticultural shows, and it encourages me to go a little further in suggestions in the way of purging exhibitions of various abuses. No judge or exhibitor ought to possess any knowledge of the exhibitors, and no judge should be a competitor. Whenever the warning is given for exhibitors and their assistants to leave the exhibition tents or building, they ought to comply at once, under the penalty of having their exhibits disqualified; it should likewise be insisted upon that the secretary and com-

mitteemen who are exhibitors, or have therefore a personal interest in the awards, should also retire till the judging is finished. Our system of staging and arranging exhibits has become so complete that judges do not require anyone beside the clerks to follow them; moreover, the remarks and comments of other persons are a fruitful source of errors in judging, for notwithstanding all that has been said and written regarding the rules for judging, the cultivated mind and eye of the judges must still be concentrated on the objects shown, if an accurate judgment is to be given. *A. D. Christie, Ragley Gardens.*

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 13.—The last meeting for the year 1898 of the Committees of the Royal Horticultural Society was held on Tuesday last in the Drill Hall, James Street, Westminster. There was not a great array of exhibits, but in view of the fact that the Chrysanthemum season has practically terminated, and that Christmas was less than a fortnight ahead, the exhibition was satisfactory. Orchids constituted an important feature in the display, and there were some choice novelties shown. The collections of varieties of Cypripedium were most interesting. The exceedingly popular winter-flowering Begonia, Gloire de Lorraine, was extensively shown, and Messrs. JAS. VEITCH & SONS had a group of plants representing their B. socotrana hybrids. Zonal Pelargoniums from Swanley, Chrysanthemums from Mr. W. WELLS, Earlswood, and fine-foliage plants from Messrs. SANDER & Co. and others, were all pretty features. The Fruit Committee had very little indeed before them. Most of the members of the several committees make an endeavour to attend the final meeting for the year, and on Tuesday a good number of them were present, and the compliments of the season were freely exchanged. In the afternoon, the Rev. Professor HENSLow gave an interesting lecture upon certain plants he selected from those exhibited.

AWARDS TO NOVELTIES.

- Seldom are fewer awards granted than on Tuesday last. The Floral Committee recommended a First-class Certificate to *Asparagus Sprengeri compacta*. The Orchid Committee recommended Awards of Merit to *Lælia Digbyana purpurata* and *Calanthe revertens*. Also a First-class Certificate to *Cypripedium insigne* var. *Harefield Hall*.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. C. T. Druery, H. J. Jones, J. H. Fitt, H. B. May, C. Jefferies, R. Dean, G. Stevens, W. Howe, J. Hudson, J. Jennings, C. J. Salter, J. F. McLeod, G. Gordon, C. E. Pearson, C. E. Shea, J. T. Bennett-Poë, J. D. Pawle, C. Blick, H. Turner, E. T. Cook, and G. Paul.

Begonia Gloire de Lorraine was again capitally shown by Mr. H. B. MAY, Dyson's Lane Nursery, Upper Edmonton, who had upwards of thirty beautifully-flowered specimens. These were freely interspersed with choice Ferns, and a very effective display was made (Silver gilt Banksian Medal).

Asparagus Sprengeri compacta, for which Mr. MAY obtained a First class Certificate, differs from the type only in its dwarf habit. It is said that under any system of cultivation the growths will not become more than 18 inches in length. The growths are produced more numerous, and for some purposes the plant will be found more convenient than *A. Sprengeri*, although this is a graceful and valuable plant. Several additional seedling varieties of the plant, exhibiting more or less peculiarities, were exhibited.

Messrs. H. CANNELL & SONS, Swanley, exhibited a collection of flowers of zonal Pelargoniums in sprays, relieved with an abundance of Fern fronds. The two best novelties shown were *The Sirdar*, a very large single flowered scarlet, of good form; and *The Mikado*, also a large flower, of a shade of cerise colour. There were upwards of forty varieties represented in this bright exhibit (Silver-gilt Banksian Medal).

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, Chelsea, had a very pretty group upon the cross-table of their hybrid Begonias, obtained from crossing *B. socotrana* with a tuberous-rooted variety from the Andes. Several of these excellent winter bloomers have already been figured in our pages. The strain now includes varieties that exhibit more or less difference in habit of growth and in the shade of colour of the flowers. *Myra* is rather shorter than *Winter Cheer*, and considerably paler in colour. *Ensign* is a double-flowering variety of rather compact habit. Success shows the greater distinctness in colour, and it is a more double flower; the colour is warm pink. Messrs. Veitch & Sons also showed a plant of *Exquisite*, a beautiful yellow-flowered variety of their hybrid *Rhododendrons* (Silver Flora Medal).

From Mrs. WINGFIELD, Amptill House, Amptill, Beds (2r.), Mr. W. J. EMPSON, was shown a plant in flower of *Plumbago rosea*, a very useful and showy stove plant that should be as generally grown as the blue-flowering species, *P. capensis*.

MESSRS. SANDER & Co., St. Albans, showed some large, well-flowered plants of *Acalypha Sanderi* also plants of

Dracæna Godseffiana, *D. Sanderiana*, *Linospadix Petrickiana*, *Acalypha Godseffiana*, a most decorative plant, with green leaves, margined with cream colour (Silver Banksian Medal).

A group of miscellaneous plants was shown by C. A. PEARSON, Esq., Frenshaw Place, Farnham (gr., Mr. J. Prewett); this exhibit contained plants of *Begonia Gloire de Lorraine*, *Ericas*, *Dracænas*, *Codiceums*, &c. (Silver Banksian Medal).

Mr. W. WELLS, Earlswood Nurseries, Redhill, Surrey, made an exhibit of *Chrysanthemum* blooms. We noticed the new white Japanese Nelly Pockett, Beauty of Sholing, a yellow-flowered decorative variety, some of the florets marked red; Mrs. W. Butters, a white decorative, with singularly forked florets; Redhill Beauty (Japanese), a soft pleasing shade of yellow; Snowflake, a new white somewhat reflexed Japanese, a very late bloomer, and having moderately short florets of good width; Sunset, buff Japanese; Madame Phillip Rivoire, white Japanese; M. Veillard, yellow Japanese; Madame H. de la Rochette (Cordonnier), a Japanese, with incurving florets of a very delicate shade of pale green; Julia Scaramanga; Georgina Pitcher, Japanese incurved, yellow; and Sam Caswell, a small flower, with narrow pink-coloured florets (Silver Banksian Medal).

Mr. W. J. GODFREY, Exmouth Nurseries, Devon, showed blooms of three varieties of *Chrysanthemums*, Queen of Pink, Christmas Favourite (white), and Winter White, all promising decorative varieties.

Several varieties of *Primula sinensis* were shown by Mr. ECKFORD, Wem, Salop.

A bloom of the singular *Narcissus viridiflorus* was shown by A. KINGSMILL, Esq., Harrow Weald. The blooms of this species are very small, and consist of a perfectly green perianth, with a green cup in centre.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. Ballantine, H. Little, G. W. Law-Schofield, Elijah Ashworth, H. J. Chapman, W. H. Young, W. H. White, H. M. Pollett, E. Hill, T. B. Haywood, T. W. Bond, and Sydney Courtauld.

The last meeting of the year was graced by an unusually fine and bright display of Orchids. The most extensive group, extending over some 25 feet run of the stages, was from Sir TREVOR LAWRENCE, Bart., Burford, Dorking (gr., Mr. W. H. White). The principal feature of this exhibit consisted of the fine sets of the Burford hybrid *Calanthes*. A number of well-bloomed plants of the handsome *Calanthe* \times *Burfordensis* well displayed its bright carmine-crimson tint. Of the same class of rich bright carmine-crimson colour, the new *C. x revertens* was also shown, and secured an Award of Merit. Its parentage is not determined, but the flat, peculiar ovate form of the lip of *C. labrosa* is evident, and it has taken part in the production at some stage of its history. Other handsome varieties were *C. x versicolor*, white, with reddish-rose eye; *C. x bella*, rose, with white eye, bearing a dark blotch; *C. x amabilis*, pink, white centre; *C. x Victoria Regina*, creamy-white, tinged with pink; and *C. x Veitchi splendens*, one of the brightest of the carmine-crimson class. The group also included some fine forms of *Cypripedium* \times *Leeanum*, a good plant of that form of *C. x Ceres* known as *fascinatium*; a plant of the curious *Odontoglossum* \times *Coradinei flavidum*; and a home-raised hybrid *Odontoglossum*, supposed to be between *O. triumphans* and *O. crispum*. It has a light yellow ground, marked with reddish-brown spots, and resembling *O. x Wilckeanum* (Silver Flora Medal).

A Silver Flora Medal was also awarded to R. I. MEASURES, Esq., Cambridge Lodge, Camberwell, for a very fine group of Orchids, including a very interesting series of varieties of *C. insignis*. Two of the best of these were the charming *C. i. Sanderæ*, and the stately *C. i. Ernesti*, which is a clear yellow form, showing much white on the upper sepal, and indistinct traces of spotting, proving it to be of the *C. i. violaceo-punctatum* type. Also remarkable were *Cypripedium* \times *Wottoni* (*bellatulum* \times *callosum*), and a similar variety said to be obtained between *C. Godefroyæ* *leucichilum* and *C. callosum*. This plant was interesting, as it was from seed sown in January, 1896. Other good *Cypripediums* were *C. x Allenianum* *superbum*, *C. x Behrensianum*, varieties of *C. x Leeannum*, *C. x Milo*, *C. x Zeno*; and of other plants, *Masdevallia pachyura*, *M. x Measuresiana*, the singular black and silver *Pleurothallis punctulata*, *Cattleya* \times *Miss Harris*, and *Lælio-Cattleya* \times *Schilleriana*.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, showed a very important group, in which were some remarkable hybrids. Of these the finest was *Lælia* \times *Digbyana*-*purpurata* (*Digbyana* δ , *purpurata* ϕ). The plant is evidently intermediate between the parents, though the flower in form closely approached a fine *L. purpurata*, and, contrary to the case of *L.-C. x Digbyana*-*Mossie*, but little fringing is as yet perceptible on the lip. The sepals and petals are bluish-white, and the front of lip large, and of a purplish-crimson colour (Award of Merit). Other remarkable hybrids were *Lælia* \times *Omen* (*autumnalis* ϕ , *purpurata* δ), like a much-enlarged *L. autumnalis*; *Lælio-Cattleya* \times *Frederick Boyle* (*C. Trianae* ϕ , *L. anceps* δ), in form like a very large *Lælia* *anceps*, but with *Cattleya*-like lip; sepals and petals bright light rose, lip yellow at the base, veined purple, and purplish crimson in front. *L.-C. x F. Boyle* var. *amena* (*C. Trianae* ϕ , *L. anceps* *Veitchiana* δ), with the middle area of the lip cream-white; the fine *L.-C. x Semiramis*, *Cattleya* \times *Ariel* (*Bowringiana* ϕ , *Gaskelliana* δ), *L.-C. Andreae* var. *Agnes*; *Phalanopsis* \times *Hebe* (*rosea* ϕ , *Sanderiana* δ), *Lælio-Cattleya* \times *Decia*, *Lælia* \times *Novelty*, *Ipidendrum* *Endresio-Wallisii*, and a very fine set of *Cypri-*

pediums, including *C. insignis* *Sanderæ*, *C. i. Sanderiana*, &c. (Silver Banksian Medal).

Among the dozens of varieties of *Cypripedium* *insigne* shown, the noble *C. insignis* *Harefield Hall* variety, shown by ELIJAH ASHWORTH, Esq., Wilmslow (gr., Mr. H. Holbrook), stood out as a giant in proportions, and it is exquisite in form and marking. The noble plant, for which a First-class Certificate and a Cultural Commendation was awarded, has been grown in the Harefield Hall collection since early in 1894. The plant bore a number of perfectly-formed very large flowers, and is doubtless the finest form of its class. A distinguishing characteristic is the great size of both upper and lower sepals. The superior one was pale yellowish-green on the lower half, spotted with distinct and evenly displayed dark blotches, the upper half being pure white.

Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire (gr., Mr. A. Chapman), sent a fine collection of cut *Cypripediums*, among which were the large clear yellow *Cypripedium* *insigne* *Dorothy*, and other good forms; *C. x Niobe*, and *C. x Niobe* *superbum*; a number of good forms of *C. x Leeannum*, including *C. L. giganteum* and *C. x L. superbum*; a number of *C. Spicerianum*, of which one very dark and one pale form were distinct; a fine spike of *Cymbidium* *Traceyanum*, *Lælia* *anceps*, &c. (Silver Banksian Medal).

HENRY LITTLE, Esq., Baron's Hall, Twickenham (gr., Mr. Howard), staged a pretty group, especially strong in *Cypripediums*, among which were *C. tonsum*, *C. Stonei*, *C. Chamberlainianum*, *C. Spicerianum*, and other species. Also a number of good hybrids, including *C. x Lathamianum*, *C. x Behrensianum*, &c. (Bronze Medal).

Messrs. HUGH LOW & CO., Clapton, staged a good group, in which the central figure was the pretty clear-yellow *Cypripedium* *insigne* *Laura Kimball*; around it were some fine forms of *C. x Leeannum*, *C. x Chas. Canham*, and other hybrids; *Lælio-Cattleya* \times *Apollonia*, *L.-C. Wolstenholmia*, *L.-C. x Aurora*, the pale purple-tinted *Dendrobium* *Phalanopsis violaceum*, quite a novelty in colour; and at the back the dark-coloured *Cymbidium* *Traceyanum* *superbum* (Silver Banksian Medal).

Messrs. F. SANDER & CO., St. Albans, staged a group in which were *Cypripedium* \times *Leeannum* *superbum*, *C. x L. giganteum*, *C. x Madame Margaret Hye*, a large flower of the *C. x Leeannum* *giganteum* class; *C. x Albert Hye*, *C. x nitens* *superbum*, *C. x Titus*, *Sander's* var.; *C. x callosoliriatissimum*; a good series of the "montanum" type of *C. insignis*, including *C. i. giganteum*, &c.; *Oncidium* *varicosum*, *O. Forbesii*, &c.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke) showed *Odontoglossum* *Ruckerianum* *platycheilum*, a pretty variety of a creamy-white colour, tinged with rose, and profusely spotted with dark red. A peculiar feature was its flat, ovate, serrate lip.

Sir WILLIAM MARRIOTT, Down House, Blandford (gr., Mr. Denny), showed a fine hybrid obtained between *L.-C. x elegans* and *C. Warscewiczii*, and which is identical with *L.-C. x Henry Greenwood* (*L.-C. x elegans* \times *C. x also a Hardyana*); hybrid between *C. Mandeli* and *C. Warscewiczii*.

Captain G. W. LAW-SCHOFIELD, New-Hall-Hey, Rawten-stall, Manchester (gr., Mr. Shill), showed *Cypripedium* \times *Norma* (*Spicerianum* \times *Niobe*) of fine quality.

F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, showed the curious *Lycaste* *lasioglossa*, reddish in colour, with singularly hairy lip (Botanical Certificate).

W. C. WALKER, Esq., Winchmore Hill (gr., Mr. Geo. Cragg), showed a fine plant of *Dendrobium* *aureum*, covered with flowers (Cultural Commendation); and *Lycaste* *cruenta*.

G. C. ROBERTS, Esq., Nottingham, sent a fine spike of a variety of *Cymbidium* \times *Winnianum*.

Fruit Committee.

Present: Philip Crowley, Esq., chairman, and Messrs. Geo. Bunyard, J. Willard, Jos. Cheal, Jas. H. Veitch, A. F. Barron, T. J. Saltmarsh, Alex. Dean, C. Herrin, W. Pope, J. W. Bates, Geo. Wythes, W. J. Empson, H. Balderson, G. H. Sage, F. Q. Lane, Jas. Smith, Geo. Reynolds, G. Norman, and Robt. Fife.

Mr. W. SHINGLER, gr., Melton Constable, East Dereham, Norfolk, showed a bunch of Grapes, said to be a cross from Lady Hastings and Gros Colman. It was thought by the committee to be undistinguishable from Gros Colman.

There were several seedling Apples shown, including a nice-looking variety from Mr. Ross, Welford Park Gardens.

Messrs. BRETON, Forest End, Sandhurst, showed several heads of Cardoon, a variety of the Globe Artichoke, that furnishes thick fleshy leaves like Celery, not commonly cultivated in England (Vote of Thanks).

An interesting exhibit was made by Mr. C. HERRIN, The Gardens, Dropmore, who had some very nice tubers of *Oxalis crenata*, an edible vegetable, in the nature of a small Artichoke, and said to be much easier of satisfactory cultivation than *Stachys tuberifera*. *Oxalis crenata* was introduced some forty years ago (Vote of Thanks).

WARGRAVE AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

DECEMBER 7.—An ordinary meeting of the above Society was held on the above date, when Mr. J. W. GROVES F.L.S., gave the second of his course of lectures on Botany, the subject being "Stems."

The lecturer first recapitulated his previous lecture by showing a series of lantern-slides, and then passed on to the subject for the evening. He gave the definition of a stem,

and showed how it was built up of groups of cells. The various parts composing the stems of dicotyledonous and monocotyledonous plants were fully described. The means of leaf insertion and the continuity of protoplasm from cell to cell, was made exceedingly clear. The various means by which stems are supported, their many shapes and kinds, the manner in which injuries are repaired, why a leaf falls, the best methods of pruning, budding and grafting, were all explained. Microscopic preparations in illustration of the lecture were shown at the close. A fine group of *Cypripedium* *insigne* and *C. insignis* *Maulei* were exhibited by the chairman, gr. to J. P. WHITE, Esq., and a good collection of *Chrysanthemums* by Mr. W. Greenaway, gr. to S. V. COOTE, Esq. H. Coleby, Hon. Sec.

PUTNEY, WANDSWORTH, & DISTRICT CHRYSANTHEMUM.

DECEMBER 12.—Nearly a hundred members of this enterprising Society were present on Tuesday last at the annual dinner. It was held at the Spread Eagle, Wandsworth, and the proceedings were enthusiastic and enjoyable. Advantage was taken of the event to publicly present the handsome Challenge Cup (value 25 gs.) to Mr. G. J. HUNT, Ashstead Park Gardens, Epsom, whose absolute property it has now become. Several other valuable special prizes were similarly presented.

The recent exhibition held in the Town Hall, Wandsworth, was a success. Notwithstanding that more expenses have been incurred during the past year than heretofore, the Society has a satisfactory condition of finance, there being a balance on the right side of £10.

The Hon. Sec., Mr. J. F. McLeod, in responding to the toast of the Society, intimated that it was proposed to encourage the exhibition of *Chrysanthemum* blooms in vases by including a class for them in the next year's schedule, and offering a 1st prize of £10 in cash, with valuable 2nd and 3rd prizes also. The Secretary declared the intention of the committee was to make the Society's exhibitions (so far as regards the county of Surrey) second only to those of the National *Chrysanthemum* Society.

The show next year will be held in Putney, and presumably in 1900 it will be again transferred to Wandsworth.

NATIONAL DAHLIA.

DECEMBER 13.—The annual meeting of this Society took place at the Hotel Windsor, T. W. GIRDLESTONE, Esq., M.A., the President, in the chair, there being a large attendance of members, and especially of growers from the country.

The Secretary Mr. J. F. HUDSON, submitted the annual report, which set forth that the season of 1898 was remarkable for the severe and long-continued drought, which so affected the development of the Dahlia in some districts that some cultivators could not exhibit, whilst others could do so only sparingly. The season was also remarkable for the length of time the Dahlias continued in bloom, remaining in flower in many localities quite up to the middle of November. The annual exhibition at the Crystal Palace in September was affected by the incidence of the season, and though the entries—300 in number—were up to the average, the show generally was not so large as is usual. The show and fancy Dahlias especially did not display their usual finish, but the Cactus varieties were very fine, and the varieties continue to increase with remarkable rapidity. The single varieties were also well represented, and they appear to be rising in popular favour. Though new varieties were numerous, and especially in the Cactus section, Certificates of Merit were sparingly awarded, and only to those of the highest excellence.

During the past season the Society issued a catalogue of Dahlias, the president taking the leading share in compiling it. A goodly number of copies have been disposed of, and there is a demand for it from non-members of the Society who are cultivators. A movement is on foot in favour of the affiliation to the parent Society of Dahlia Societies in the provinces, which appear to be on the increase. Reference was made in the report to the death of Mr. W. H. Cullingford, by whom the Cactus Dahlia *Juarezii* was introduced to this country. The report concluded with an expression of thanks to the donors of special prizes.

The financial statement showed that the receipts from all sources had amounted to £292 2s. 7d., including a balance in hand of £21 1s. 1d.; and the entire expenditure, including the payment of all prizes awarded at the Crystal Palace Show and the cost of issuing the catalogue, amounted to £186 18s. 10d., leaving a balance in hand of £105 3s. 9d. The cost of printing the catalogue was £21, but this expense was to a considerable extent met by advertisements in and the sale of the same.

Mr. T. W. GIRDLESTONE was elected President, Messrs. T. Hobbs, R. M. Hogg, and F. W. Sharp, were added to the Vice-Presidents; and Messrs. W. Treseder and G. Gosney were added to the committee; Mr. G. Mawley was elected Treasurer, and Mr. J. T. Hudson, Secretary. The list of True Cactus-Dahlias, annually published in the Schedule, was revised; several of the older varieties, such as *Delicata*, *Earl of Pembroke*, *Gloriosa*, *Iona*, *Juarezii*, *Mary Hillier*, *May Pictor*, *Mr. H. Cannell*, *Robert Canuell*, and *Violet Morgan*, were struck out, as superseded by varieties of improved form; and the following were added to the list:—*Antelope*, *Countess of Lonsdale*, *Lucius*, *Magnificent*, and *The Clown*, all Certificated by the Society; and the following also—*Viscountess Sherbrooke*, *Bridesmaid*, *Ranji*, *Laver-*

stock Beauty, Falka, Stella, Casilda, and Ebony. It was also resolved to give exhibitors freer choice in the exhibition of Cactus varieties than has hitherto been the case.

DEVON AND EXETER GARDENERS' ASSOCIATION.

CHEMICAL MANURES APPLIED TO GARDEN CROPS.—In connection with the Devon and Exeter Gardeners' Association, Mr. F. W. E. Shrivell, F.L.S., Thompson's Farm, Golden Green, Tonbridge, Kent, lectured in the Guildhall on November 24, on "Further experiments with Chemical Manures applied to garden crops." Mr. W. Mackay presided over a large attendance.

Mr. Shrivell said everyone knew what they were doing at Golden Green. They were testing the economical value of chemical manures as compared with dung. They wanted to know really if it was possible to grow market produce more cheaply by the aid of small quantities of chemicals and dung than with large quantities of dung alone. This was their fifth year of working, and with the advance of each year the reports became more interesting. Their system had been to add chemicals to the land to as far as possible take the place of dung. Dung was made up of four principal constituents—potash, phosphoric acid, ammonia, and lime. They were, therefore, putting these four chemicals into the ground in suitable proportions, and with a judicious use of that mixture they were getting marvellous crops, and at a much cheaper rate than could be produced by the aid of dung alone. Mr. Shrivell gave the results of the experiments:—

A		B	
25 Loads of Dung.		25 Loads of Dung.	
1 cwt. nitrate of soda		2 cwt. nitrate of soda	
6 cwt. basic slag, or		6 cwt. basic slag, or	
4 cwt. superphosphate of lime		4 cwt. superphosphate of lime	
Cost, £6 10s. per acre.		Cost, £7 per acre.	

C		D	
Chemicals only.		25 Loads of Dung.	
4 cwt. nitrate of soda		4 cwt. nitrate of soda	
6 cwt. basic slag, or		6 cwt. basic slag, or	
4 cwt. superphosphate of lime		4 cwt. superphosphate of lime	
Cost, £3 per acre.		Cost, £3 per acre.	

E		F	
75 Loads of Dung.		50 Loads of Dung.	
Cost, £5 per acre.		Cost, £10 per acre.	

Dealing by the aid of his large diagram (in which all the results were calculated upon a per-acre basis) with some of the most interesting crops, the lecturer first took—

Asparagus (First Year's Cutting).		
	Bundles per Acre (50 sticks).	Weight per Bundle.
F Plot ...	103	17 ounces.
E " ...	637	17½ "
D (Salt) ...	104	21½ "
D (Kainit) ...	1,158	20½ "
C (Salt) ...	622	17½ "
C (Kainit) ...	803	21 "

Second Year's Cutting.		
	Bundles per Acre (50 sticks).	Weight per Bundle.
F Plot ...	1,109	18 ounces.
E " ...	1,111	17 "
D (Salt) ...	1,132	19½ "
D (Potash) ...	1,351	2½ "
C (Salt) ...	990	19 "
C (Potash) ...	1,023	21 "

Tripp's Onions (two years' average).—F Plot, 9 tons; E, 7 tons; A, 9 tons 7 cwt.; B, 9 tons 5 cwt.; D, 10 tons 15 cwt.

This Year.—F Plot, 12 tons 12½ cwt.; E, 14 tons 11½ cwt.; A, 15 tons; B (Potash), 19 tons 1 cwt.; D, 17 tons 14½ cwt.

Strauberris (three years' average).—F Plot, 1 ton 7½ cwt.; E, 1 ton 12 cwt.; B, 1 ton 19½ cwt.; C, 1 ton 3 cwt.

Fourth year's crop.—F Plot, 2 tons 12 cwt.; E, 4 tons 4½ cwt.; B, 4 tons 7 cwt.; C, 2 tons 9½ cwt.

Brussels Sprouts (four years' average).—F Plot, 282 sieves; E, 257 sieves; D, 321 sieves; C (Kainit), 305 sieves; C (plus salt), 267 sieves.

The relative value of the produce and the cost of manuring worked out as follows:—

Plot	Sieves.	Cost of Manure.	Produce, ls. fd. per sieve.
E ...	257	5 0 0	19 5 0
F ...	282	10 0 0	21 3 0
C ...	305	3 2 0	22 17 0
C (plus salt) ...	267	2 17 0	20 0 0

Califlowers (four years' average).—F Plot, 15 tons 2 cwt.; E, 12 tons 8 cwt.; D, 15 tons 9 cwt.; C, 14 tons 8 cwt.

Broccoli (three years' average).—F Plot, average weight, 2 lb. 5 oz.; E, 1 lb. 14 oz.; A, 2 lb. 4 oz.; B, 2 lb. 6 oz.; D, 2 lb.; C, 2 lb. 7 oz.

Fourth Year, 1898.—F Plot, 2 lb. 8 oz.; E, 2 lb. 4 oz.; A, 2 lb. 6 oz.; B, 2 lb. 12 oz.; D, 2 lb. 6 oz.; C, 2 lb. 12 oz.

Spring Cabbages (three years' average).—F Plot, 16½ tons; E, 15½ tons; B, 17½ tons; D, 16½ tons; C, 18½ tons.

Fourth Year, 1898.—F Plot, 16 tons 5½ cwt.; E, 13 tons 11½ cwt.; B, 16 tons 14 cwt.; D, 19 tons 5½ cwt.; C, 17 tons 6½ cwt.

Where salt, kainit, or potash is mentioned, it has been used in conjunction with the other chemicals referred to. The amount of kainit and salt employed being at the rate of 4 cwt., and of potash (sulphate of potash) at the rate of 1 cwt. per acre. *Western Time*, November 24, 1898.

LAW NOTES.

DAMAGES AGAINST A SEEDSMAN.

His Honour, Judge Stravenson, has now given judgment in the Carlisle County Court, in an action brought by Mr. McLaren, a hotel-keeper of Wetheral, against the defendants, Messrs. Clarke Bros., seedsmen, of Carlisle. The plaintiff claimed damages in connection with a purchase of grass lawn-seeds, which he alleged contained a large quantity of Yorkshire-fog, or white-top. The judge found for the plaintiff for £18.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.		BRIGHT SUN.		
	ACCUMULATED.					(More +) or less (−) than Mean for the Week.	No. of Rainy Days since January 2, 1898.	Total Fall since Jan. 2, 1898.	Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 2, 1898.
	Above (+) or below (−) the Mean for the week ending December 10.	Above 42° for the Week.	Below 42° for the Week.	Above 42° difference from Mean since January 2, 1898.	Below 42° difference from Mean since January 2, 1898.

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

MARKETS.

COVENT GARDEN, DECEMBER 15.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.		s. d. s. d.	
Arums, 12 blooms		9 0-12 0	
Azalea indica, white, 12 sprays		1 0-1 3	
Carnations, pr. doz. blooms		2 0-2 6	
Chrysanthemums, white, 12 blooms		6 0-9 0	
— yellow, 12 bms.		4 0-6 0	
— per dozen bun.		6 0-9 0	
Eucharis, per dozen		4 0-6 0	
Gardenias, per doz. blooms		2 0-3 0	
Hyacinths, Roman, per doz. bunches		6 0-8 0	
Lilium Harrisii, per dozen blooms		9 0-12 0	
— lancifolium, per dozen blooms		8 0-10 0	
— longiflorum, per dozen bunches		12 0-15 0	
Lily of the Valley, dozen sprays		1 6-2 6	
Maidenhair Fern, per 12 bunches		6 0-8 0	

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.		s. d. s. d.	
Adiantums, p. doz.		4 0-12 0	
Aspidistras, p. doz.		12 0-30 0	
— specimen, each		5 0-15 0	
Chrysanthemums, various, per doz.		9 0-24 0	
Dracanas, each		1 0-7 6	
— various, per doz.		12 0-24 0	
Ericas, per dozen		12 0-21 0	
Evergreen shrubs, in variety, p. doz.		6 0-24 0	
Ferns, small, per dozen		1 0-2 0	
— various, p. doz.		5 0-12 0	

FRUIT.—AVERAGE WHOLESALE PRICES.		s. d. s. d.	
Apples, King, per sieve		2 6-3 8	
— Gold Knobs, bush.		4 0-5 0	
— Wellingtons, bush.		5 0-8 0	
— Sourings, per bushel		5 0 —	
— Blenheim, per bush.		5 0-7 0	
— Large cookers, per bushel		4 0-5 0	
— Nova Scotia, Bienheims, Ribstons, Kings, and other various sorts, per barrel		10 0-20 0	
— Californian, New Towns, per case		9 0-10 0	
— Baldwins, &c., per case		8 6-10 0	
— Canadian, various sorts, Baldwin, Ben Davis, Greenings, &c., per barrel		10 0-20 0	
Bananas, bunch		7 0-10 0	

VEGETABLES.—AVERAGE WHOLESALE PRICES.		s. d. s. d.	
Artichokes, Globe, per doz.		3 0-4 6	
— Jerusalem, per sieve		1 6-2 0	
— Stachys, or Chinese, p. lb.		0 5 —	
Beans, Dws., Channel Islands, lb.		10-1 3	
— French, lb.		0 4-0 6	
— Maderia, bkt.		2 0-2 6	
Beetroots, per dozen		0 6-0 9	
— bushel		2 0 —	
Brussels Sprouts, per sieve		1 6-1 9	
— per bushel		2 0 —	
Cabbage, doz.		1 0-1 3	
— Coleworts, per bushel		1 6 —	
— Savoys, p. doz.		1 3-1 9	
— per tally		6 0-8 0	
Cardoons, each		1 0-1 3	
Cauliflowers, English, per dozen		1 6-2 0	
— per tally		7 0-10 0	
— Italian, baskets of 18		2 9-3 6	
Celeriac, per dozen		1 6-2 0	
Cress, doz. punnets		1 6 —	
Carrots, washed, in bags, fine		3 0-3 6	
— unwashed		2 0 —	
— Surrey, bunches		2 0-2 6	
Celery, Red, dozen bundles		8 0-18 0	
Chicory, per lb.		0 3-0 4	
Chow Chows, doz.		2 0 —	
Cress, doz. punnets		1 6 —	
Cucumbers, per doz.		6 0-12 0	
Endive, French, per dozen		1 4-2 0	
Garlic, per lb.		0 3 —	
Horseradish, New English, bundle		2 0-2 6	

POTATOES.
Beauties, Saxons, Giants, Up-to-Date, &c., according to sample, 60s. to 80s. per ton; D'Albar Main Crops, 90s. to 95s. *John Bath*, 32 and 34, Wellington Street, Covent Garden.
REMARKS.—On Saturday last green vegetable trade was brisk—quite a good finish. Only a few Brussels Sprouts come good. Cabbages are a slow trade. Pines are advanced slightly in price. There are on sale now some of that old and the best of all Oranges—the St. Michael. Mistletoe in evidence, but little Holly at present.

SEEDS.

LONDON: December 14.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., describe to-day's seed-market as quite idle, all business in grass and Clover seeds being apparently postponed until the new year. For Rye there is an improved inquiry. Tares meantime show no change. Hemp, Canary, and Millet seeds move off slowly at last week's rates. For Blue Peas and Maroon Beans, former terms are asked. Californian Butter Beans are in good request, whilst choice samples of new Scarlet and White Runners are still offering at very mod. rate prices. The market for Mustard and Rap

seed keeps steady, but Linseed is dull. The Board of Trade Returns give the imports of Clover and grass seeds into the United Kingdom for the eleven months of this year, ending November 30, 1898, as 299,301 cwt., value £572,589, as against 250,862 cwt., value £499,461, for the corresponding period of 1897.

FRUIT AND VEGETABLES.

GLASGOW: December 14. — The following are the averages of the prices recorded since our last report: — Apples, per barrel: Canadian—Kings, 25s. to 26s.; Baldwins, 21s. to 22s.; Greenings, 19s. to 20s.; various, 16s. to 18s.; Spies, 20s. to 21s.; American—Californian Newtown Pippins, 9s. to 10s. per case; Lemons, Messina, 8s. to 14s. per case; do., Palermo, 6s. to 10s. do.; Grapes, home, 1s. to 1s. 9d. per lb.; Guernsey, 6d. to 9d. do.; Oranges—Jaffas, 9s. to 9s. 6d. per case; Valencia, ordinary, 42s. 7s. to 9s. do.; do. large, 10s. to 12s. do.; do. extra large, 12s. to 15s. do.; do. large, 714's, 7s. 6d. to 8s. 6d. do.; Bananas, large bunches, 7s. 6d., 9s., and 11s., per bunch; Pears—Californian Winter Nelis, 16s. to 17s. per case; do., Californian Easter Beurré, 14s. to 16s. do.; Dates, Halawai, 16s. per cwt.; Mistletoe, 12s. to 14s. per crate; Onions, Valencia, 4's, 6s. 6d. to 7s. 6d. per case; do., 5's, 9s. to 10s. do.; Tomatoes, Scotch, 5d. to 8d. per lb.; do., English, 5d. to 7d. do.; do. Tenerife, 5s. and 5s. 3d. per case; Cabbages, 1s. 2d. to 1s. 8d. per dozen; Cauliflowers, 1s. 6d. to 2s. 6d. per dozen; Parsnips, 3s. to 4s. per cwt.; Leeks, 1s. 6d. to 2s. 6d. per dozen bunches; Parsley, 1s. to 1s. 6d. per stone; Potatoes, best, 5d. to 6d. per stone; Carrots, 3s. to 3s. 6d. per cwt.; Lettuce, Cabbage, 1s. 3d. per dozen; Horseradish, 1s. 9d. to 2s. per bundle; Beetroots, 6d. to 7d. per dozen; Brussels Sprouts, 1s. 6d. to 2s. 6d. per stone; Turnips, 3d. to 4d. per bunch; Celery, Scotch, 9d. to 2s. 6d. per bundle; do., English, 1s. to 2s. 6d.

LIVERPOOL: December 14. — Wholesale Vegetable Market: — Potatoes, per cwt., Giants, 1s. 10d. to 2s. 3d.; Main Crop, 2s. 6d. to 3s.; Bruce, 2s. 2d. to 2s. 6d.; Turnips, 6d. to 8d. per doz. bunches, and Swedes, 1s. 1d. to 1s. 3d. per cwt.; Carrots, 6d. to 8d. per doz. bunches, and 2s. 9d. to 3s. 3d. per cwt.; Parsley, 6d. to 8d. per doz. bunches; Onions, English, 5s. 6d. to 6s. 6d. per cwt.; do. foreign, 4s. 9d. to 5s. 3d. per cwt.; Cauliflowers, 1s. 3d. to 3s. 6d. per dozen; Cabbages, 6d. to 1s. per dozen; Celery, 8d. to 1s. 6d. per dozen. *St. John's*: — Potatoes, 10d. to 1s. 2d. per peck; Grapes, English, 2s. to 3s. 6d. per lb.; do., foreign, 4d. to 8d. do.; Pines, English, 5s. each; Cob-nuts, 8d. per lb.; Mushrooms, 1s. 6d. per lb. and 1s. 6d. per basket. *Birkenhead*: Potatoes, 8d. to 10d. per peck; Filberts, 10d. per lb.; Grapes, English, 1s. 6d. to 3s. do.; foreign, 4d. to 8d. do.; Pines, English, 5s. to 10s. each; foreign, 3s. to 5s. do.; Mushrooms 1s. to 1s. 6d. per lb.

CORN.

AVERAGE PRICES OF BRITISH CORN (per imperial qr.), for the week ending December 10, and for the corresponding period of 1897, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1897.	1898.	Difference.
Wheat	s. d. 33 9	s. d. 27 6	— 6 3
Barley	26 0	28 6	+ 2 6
Oats	16 6	17 3	+ 0 9

TRADE NOTICE.

We learn that the business hitherto carried on by M. Charles Van Geert, in Antwerp, under the title "L'Etablissement d'Horticulture et de Pépinières Charles Van Geert," was, on October 17, turned into a company entitled "Firma Société Anonyme hortico-le de Calmthout," with M. Charles Van Geert as manager, and M. Antoine Kort as director, and it will be carried on in the same style as heretofore.

NOTICES TO CORRESPONDENTS.

ADIANTUM FARLEYENSE: A. S. A lower temperature by 5° at night, a light position, less shade given in sunny weather, and more air afforded when the weather is mild, will probably prevent the maladies you deplore. It is wrong practice to stand the pot in a saucer of water, although to stand it over a vessel containing water would tend to good health in the specimen, and counteract the alleged occasional dryness of the air of the house.

BOOKS: W. H. Newbrook. *Hardy Ornamental Flowering Trees and Shrubs*, by A. D. Webster, published at the Gardening World office, 1, Clement's Inn, Strand, W.C. — *Amateur. The Vegetable Garden*, by MM. Vilmorin-Andrieux; English edition published by John Murray, Alber-

marle Street, Piccadilly. — W. F. Stanley. *Handy Book of Fruit Culture under Glass*, by David Thomson; published by Blackwood & Sons. The same gardener also wrote *A Practical Treatise on the Cultivation of the Grape Vine*, which was issued by the same publishers. A more recent work on the Vine is Mr. A. F. Barron's *Vines and Vine Culture*, 3rd Ed., published at the *Journal of Horticulture* office, 12, Mitre Court Chambers, E.C.

CATTLEYA PSEUDO-BULBS BORED INTO BY INSECT: Antwerp. Next week.

CHRYSANTHEMUM SPORT: G. A. King. It is evident that the sport is hardly fixed as yet, and its value therefore cannot be appraised. Cultivate liberally cuttings from this plant next season.

DRESSINGS FOR SCALE ON THE PEACH: Amateur. These are various. You might use clean water, at a temperature not less than 140° Fahr., which kills old as well as young. Gishurst's Compound Soap, at the rate of 4 oz. to 1 gallon of water, should not be employed in houses after January. Petroleum emulsion, as bought of the nurserymen and florists, to be used as directed by the makers. Home-made petroleum emulsion is another, and consists of soap-suds, made with 4 oz. of soft-soap in 1 gallon of rain or soft-water, to which a wineglassful of petroleum is added. This last can be made into an adherent paint by mixing clay and cox-dung with it. See also article in present issue dealing with the use of cyanide of potassium.

HOTWATER-PIPES, AND WOOD-WORK TOUCHING THEM: Winter. No danger whatever.

MELON-RAISING: *Anxious One*. The door placed under the hotwater-pipe, with upright boards at the sides and ends, seems to supply a likely method of getting the Melon-seeds to germinate. The bottom-heat should be about 80°, not higher. We would advise the sides and ends to be made 15 inches rather than 9 inches, as you propose having them; and round the pipe, and at the bottom of the box, to place broken stone and rough cinders, and over these coarsely-sifted leaf-mould (half-decayed leaves) instead of soil. The seed should be sown two in a pot (60's or 48's), using loamy soil. If it can be managed, the top-heat should be kept at about 70°. The difficulty will be the prevention of spindling, due to great distance from the glass. Cannot you make a hot-bed in which to raise and cultivate the young plants? Sow seeds forthwith.

MILDEW ON STRAWBERRIES: *Agricola*. The plants should be placed in a sunny open space a distance away from plants the natural hosts of mildew, and they should not be crowded, but exposed to sunshine on all sides. We would advise the use of sulphide of potassium at the rate of ½ oz. to 1 gallon of water rather than that of flowers-of-sulphur, and it should be so used as a preventive. Mildewed fruits should not be retained on the plants, and the sulphide had better not be employed on the plants when in bearing.

MOLES IN THE GARDEN: X. Y. Z. We cannot recommend methods of poisoning: it is too dangerous to other animals about a place. You should trap them, or appoint some one with good eyesight to watch for them when working in their runs, and with a spud throw them up above ground. They do more good than harm.

MUSHROOM-BED A FAILURE: Jno. Checkley. The place is too cold; the bed has been insufficiently protected from the influence of cold, and has parted with its own warmth as a consequence, and this low temperature has arrested the growth of the Mushrooms, and the spread of the mycelium. The bed moreover should have been spawned at 98°, with a declining heat—not at 85°. The place is too cool for the Mushroom in winter, as attempted in flat beds. You would do better another season to make pyramidal banks, of any length, as for out-of-doors beds—base 5 feet with 4 feet slopes, such a mass of prepared stable-manure keeping its warmth and moisture much longer, and needing less water. Be sure the spawn you make use of has vitality.

NAMES OF FRUIT: A. F. Rochester. 1 and 2, Beurré Clairgeau; 3 and 5, Beurré Diel; 6, Beurré d'Anjou; 4, Much bruised. — John Wood. Apple, Hanwell Souring.—Ashby. Apples, Burr-Knot, a variety very subject to the production of suckers, and these make good stocks for grafting. The variety is only of second-rate quality.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult

the following number.—E. H. C. *Hakea laurina*—A. B. *Euonymus europæus*, common Spindle-bush.—A. M. *Cassinia fulvida*, alias *Diplopappus chrysophyllus*, New Zealand Composite.—Dr. H. M. 1, *Abies magnifica*; 2, *Abies Lowiana*; 3, *Abies Nordmanniana*; 4, *Pinus*, doubtful, perhaps *monticola*; 5, *Pinus inops*; 6, *Abies grandis*; 7, *Abies Lowiana*; 8, *Abies grandis*.

SILVER LEAF DISEASE: *An Old Subscriber*. Unfortunately, no remedy is known for this disease, nor has the cause of it as yet been discovered.

TOBACCO: G. G. B. Having dried the leaves, they must be slightly moistened so as to make them pliant, and then packed in little bundles tied together at the stalk ends in a clean cask to ferment; for unless this be done, the peculiar aroma and narcotic properties are not brought out. The fermentation should last till this aroma has developed, and the leaves taken out of the cask, and dried sufficiently to ensure no further risk of fermentation when they are finally stored in bulk. The fact of fermentation being necessary, obliges the grower to have a considerable quantity of the leaves.

TOMATO FROM THE CANARIES: G. M. The Tomato-plant is attacked by two distinct diseases—(1), the knots on the root are caused by the "root-knot eel-worm," *Herodermia radicola*; (2), a parasitic fungus—*Sclerotinia sclerotiorum*. The spawn of the fungus lives in the tissues of the stem, and when the plant is dying, numerous small black bodies, called sclerotia, are formed in the pith and rind of the stem. If the plants are allowed to lie and rot on the ground, the sclerotia present produce fruit after a period of rest, and inoculate a new crop of Tomatoes. It is obvious that both animal and fungus parasites are present in the soil, and the safest course to pursue is alternation of crops. Do not again plant Tomatoes on infected ground for three years, and in the meantime endeavour to rid the soil of the pests by the use of lime. All diseased plants should be collected and burned, otherwise the disease will spread rapidly. Take care not to convey infected soil to other parts not yet infected, as on too's, cart-wheels, shoes, &c. G. Massee.

VIOLETS IN FRAMES DAMPING-OFF: T. W. We assume that your garden is situated in the London area, and the damping-off to be due to fog, partial absence of sunlight, and the sulphurous-acid, the product of the consumption of coal present in the air in large quantities in the winter months. This substance varies in amount in the month of November per 100 cubic feet of air, from 4.73 to 39.96 milligrammes. Many species of cultivated plants are injured by fog, &c., and we may instance *Cattleya Trianaei*, *Vandas*, *Calanthes*, *Phalænopsis Schilleriana*, and *Angraecum*, among Orchids, whose blossoms drop off, disarticulate wholesale; *Bouvardias* suffer in blossoms and foliage, the latter becoming cupped; *Begonias* that bloom in the winter, *Cucumber-plants*, *Poinsettia* (*Euphorbia*) *pulcherrima*, whose bracts and leaves suffer; *Violas*, &c. The thinner the leaves, and consequently the cuticle, the more rapid the action of the London fog. *The Journal of the Royal Horticultural Society*, vol. xvi., 1893, part 1, contains a report by Professor F. Oliver (with the assistance of Professor F. E. Weiss and Miss M. F. Ewart), which throws much light on the action of urban fog on cultivated plants. We would advise you to read this report if you would combat in some degree the conditions prevailing in the London area.

IMPORTANT TO ADVERTISERS. — The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE Gardeners' Chronicle.

SATURDAY, DECEMBER 24, 1898.

THE ANCIENT VINEYARDS OF ENGLAND.

IN an interesting volume on *Monasticism*, by F. J. Feasey, on p. 79, I find the following remarks on the above subject:—

"The culture of the Mulberry and Vine—the latter never now attempted—was brought by them (the monks) to a remarkable success. A vineyard, or winegarth, was an usual adjunct of a convent, and British wines attaining a creditable repute, the Vine was cultivated with profit." In a note, the author states that a vineyard was an adjunct of the monastery at the following places:—St. Albans, St. Edmunds, and Glastonbury. And Dugdale's *Monasticon* gives reference to vineyards at Abingdon, Gloucester, Hantun for Eversham, Muchelney, Pershore, Rochester, and Thorney (Westminster); at Warden, Beds.,* at its dissolution, there was a "great vineyard" and a "little vineyard."

Then, on p. 80, the author writes:—"William of Malmesbury speaks in glowing terms of the excellence of the wine produced from the vineyards in the rich vale of Gloucester, which he compares with English wine in general, which was usually so sour as to twist the mouth of the drinkers." Finally, on p. 118, he says:—"At the dissolution of religious houses, a vineyard of 5 acres was scheduled as part of the possessions of Barking nunnery." Now, sour wine can be made out of the best vineyards.

There are two arts in wine-making: (a), the art of growing the Vine so as to produce fine-flavoured, ripe Grapes; and this is dependent on the soil, the cultivation, the climate, and the favourable seasons; and (b), the art of making good wine, not only out of fine Grapes, but also out of comparatively inferior Grapes. The latter is, perhaps, a more difficult art than that of growing the Vine. Sour wine can be made everywhere. On one occasion I lived eighteen months in Florence. I tried hard to come across a wine there that was not sour, but I did not succeed in finding it. I was directed from this "cantina" to that "cantina." A "cantina" is a wine-cellar attached to a palace, and to a palace is usually attached a vineyard, in the outskirts of Florence.

Well, I tried several of those "cantinas" in quest of a good wine, but invariably found that the Florentine wines were more or less sour. The fact was, that Italian wines all over the peninsula had been considered inferior wines, because the Italians, with their love of *dolce*

far niente had, up to that time, never taken the trouble to make good wines. The "Barolo" of Piedmont is not sour, but the new wine is so astringent that it gathers one's mouth into a purse! The old Barolo, however, is very good. It must not be supposed that in Florence they have not in summer heat enough to mature the Grape. The heat there in summer is so great that all the wealthy people run away to the Apennines, and those that remain fan themselves with a hand-fan most part of the day. The breast-high stone wall on the Lung'arno becomes so hot, even at sundown, that I could not bear to keep my hand on it.

Everybody knows that champagne is a "doctored" wine. It is made out of the ordinary white wine called *vin brut*. It is fermented in barrels, and bottled before the fermentation is completed; then, after a time the bottles are opened dexterously by experts, the sediment is extruded, and liqueur, syrup, and choice old brandy is added, in accordance with the kind of champagne that is intended. The bottles are then re-corked and wired, and stacked in tunnels dug out of the chalk rock, where the temperature never varies, summer or winter.

Out of this *vin brut*, two sections of champagne are manufactured: one for England, which is sourish, and called dry champagne; the other is for the Continent, where they prefer a sweetish champagne.

If the monks, with their rude mode of cultivation, could produce an excellent wine in the rich vale of Gloucester, I firmly believe that the same vale could produce a better wine with the modern modes of cultivation. In Worthing, about two miles north of Broadwater, there is a hill marked on the Ordnance-map "Vineyard Hill." I have not seen this hill, but I have been told that it is the likeliest place for growing and ripening Grapes.

Of course, wine-making, all the world over, depends not only on soil, climate, and management, but also on the "meteorology" of the seasons. Wine-merchants on their lists mark the years of the crack vintages, which means that, in the intercalary years, indifferent wines were produced. Now, why is it that Vine-culture in the open, and wine-making, have ceased in this country, when we are told that excellent wine was produced in monastic times?

One might ask—Why have the abbeys and monasteries been destroyed? And why has the sugar from Sugar-beet driven out the sugar from the sugar-cane? It would be well for some antiquarian to search out the cause of the vineyards of monastic times not having been continued, and why they have never been taken up again in later times. One cause may be suggested. Now-a-days everything is undertaken for money, and if 30 or 40 per cent. cannot be obtained for the outlay, the industry is left severely alone; while the monks cultivated their vineyards for love, and for filling their cellars with good and cheap wine.

Let us see, in conclusion, what is said about this point in the book on *Monasticism*, on p. 72. In those days manual labour was considered fit only for slaves. "But an abbot, mayhap a great man in the world, with the seed-bags on his head, and his monks, not a few of the princes of the earth, carrying manure on their shoulders, and going out to their daily labour in the fields," presented a new spectacle to the astonished world, and one which could not be gainsaid—the spectacle of

voluntary labour, willingly and cheerfully endured. E. Bonavia, M.D.

[Our correspondent omits to allude to the production of wine in the Marquis of Bute's vineyards near Cardiff. About once in five years the produce is so excellent, and fetches so high a price, as to cover the expenses of the indifferent seasons. Ed.]

PALMS OF LORD HOWE'S ISLAND.

The following notes are taken from a paper on the "Vegetation of Lord Howe's Island," by Mr. J. H. Maiden, in the *Proceedings of the Linnean Society of New South Wales*:—

"The mountain roads, or rather tracts, through the Palms extend for miles, and words cannot describe the exquisite beauty of the scenery. After the first few hundred feet of ascent, the Palm in greatest abundance is Curly Palm (*Kentia Belmoreana*), and apart from the beautiful mountain and marine scenery, the marvellous profusion of Palms of all sizes, their overhanging foliage frequently meeting overhead, made an impression on me that will never be effaced from my memory.

Collection of Palm-seeds.—The collection of Palm-seeds (fruits), or 'seeding,' as it is commonly called, is the staple industry of Lord Howe's Island. Seeding is performed by climbing the trees, work which is now mainly done by the boys of the island or hired boys (usually lads indentured through the Charitable Institutions Department of New South Wales). They buckle a leather strap (or strap extemporised from Palm-leaves), pass it over both ankles, and by its aid can 'shin' the tree with a minimum of fatigue. When the spikes of seeds are reached, they are jerked off by a smart downward pull; all the spikes are placed in one hand, and thus carried down to the ground. The fruits (seeds or 'nuts') are then removed from the spike by holding the spike firmly in one hand and pressing each fruit off by the thumb of the other.

The average load down the rocky mountain paths is 1½ bushel for strong boys of, say, fifteen years of age, and perhaps 2 bushels for an ordinary man. The maximum load is 3 bushels, but this is only carried by the strongest young men; and, perhaps, the carrying of so heavy a load has something of bravado in it, for when they arrive at the coast-level they are usually pretty well tired out. The seeds are put into gunny-bags, and all bags are conveyed down the mountain in the 'cubby,' a kind of knapsack arrangement borrowed from New Zealand, for it is a Maori device for carrying their children. The cubby is a sort of parallel braces, and by its use the carrier of a load can have both hands free. A load having been fixed up in the cubby, it is placed on sloping ground, and the bearer lies on his back, places his arms through the knapsack loops, and raises himself to an erect position.

Palm-seed if planted when just changing colour will germinate more readily (Edward King says three months earlier) than those which are dead-ripe. A drawback to dead-ripe seeds is the readiness with which they are attacked by weevil. It is recommended to ship Thatch and Umbrella Palm-seeds when yellowish, as they carry best at that stage.

Thatch Palm.—The leaves of *K. Fosteriana* are, as is well known, used for thatching purposes; the stems, cut to four, were at one time largely used for battens; but now they are rarely put to such use, as the trees are too valuable as seed-yielders. The largest trees of this species are on the Boat Harbour flats, on the south-east side of the island. There they attain a diameter of 18 inches or 2 feet, and a height of 60 feet. This species grows in belts all over the island.

This and the other two Palms (the Curly Palm alone excepted) take twelve months to mature the seeds after the flower appears. The seeds of the Curly Palm are greenish-black when ripe, those of the other three species are red.

Curly Palm.—*Kentia Belmoreana* will not grow,

* I suppose Beds. means Benedictines.

on the coral, sandy ground; it is always found on basalt. This species takes three years to fully mature its seeds after the flower appears.

Umbrella Palm.—*Hedysepe* (Kentia) *Canterburyana* is the largest-fruited Palm of the island. It is called 'Umbrella Palm' owing to its rounded top. It does not descend below 900 feet, and forms a blunt all round Mts. Lidgbird and Gower. Aware that the spathe was unknown, I made diligent search and found one at the foot of a tree, while a boy 'shinned' the tree for fully 50 feet, and brought me the inflorescence in perfect condition. Because of its delicate nature I took a sketch of the spathe on the spot, and also made the notes which follow. I regret my efforts to preserve the inflorescence were not attended with success. My attendant conveyed it tenderly down the mountain, and very few flowers became detached. It was raining, and the air near the coast was laden with saline matter in addition, so that ordinary methods of plant-drying were out of the question. I was destitute of appliances, and decided to plunge it into boiling water, and hung it from a rafter to drain; but the continued damp weather never permitted it to dry, and in spite of all I could do, I was unable to land it in Sydney in good condition.

Mountain Palm.—*Clinostigma Mooreanum*, F. v. M., is exclusively confined to the tops of the highest mountains, where it is subject to considerable cold. Its maximum height is 10 feet.

Uses of Palms.—I have alluded to thatch and battens under *K. Fosteriana*; Palm-leaves are eaten by cattle, but only the tips of the leaf-segments; stock never cropping them close to the rhachis except in cases of extreme hunger. Palms are used for wind-breaks, and are planted for that purpose."

ORCHID NOTES AND GLEANINGS.

"LINDENIA."

THE third and fourth *livraisons* for October and November are issued together. They contain coloured plates and descriptions of the following species and varieties:—

ODONTOGLOSSUM CRISPUM, Lindl., VAR. *RAYON D'OR*, L. Linden.

A very beautiful form of medium size, with broad undulate segments of a rosy-lilac colour. The lip is white, and together with the base of the perianth-segments has a blotch of golden colour traversed by short, radiating, purplish lines; t. 633.

ODONTOGLOSSUM CRISPUM THE CZAR, L. Lind.

A large stellate variety, with lanceolate, undulate segments, white, with a large central chocolate-coloured blotch. The lip is lance-shaped, coloured like the segments, and yellow at the base; t. 634.

MASDEVALLIA CHIMERA.

Discovered by Roez in 1871, but successfully introduced by Wallis; t. 635.

ODONTOGLOSSUM CRISPUM, Loddiges; VAR. *GRANDIFLORUM*, hort.

A species from the Organ Mountains of Brazil, with large, circular, flat flowers, the broad, undulate segments of which are of a rich brown colour. The variety shows these characters to an extreme degree. The plant is difficult to cultivate, or, rather, the cultivator has not yet discovered the suitable treatment for it; t. 636.

CATLEYA TRIANEL, Lindl., VAR. *VILLEGONIERIÆ*.

The name of Madame la Comtesse Marie de Villegontier is connected with this beautiful form of Trianel. Its flowers are of large size, rosy-lilac; the lip, two-lobed in front, has a violet-coloured blotch in front of the yellow throat; t. 637.

CYPRIPEDIUM GOWERIANUM ×, hort.

The result of a cross between *C. Laurenceanum* and *C. Curtisii*. It is a very handsome form, with spotted leaves and large flowers. The standard is

broadly ovate-acute, white, traversed with numerous purple convergent veins. The greenish petals spread at right angles, and are marked on the edges with hairy warts. The lip is large, cylindrical, green, flushed with brownish-purple; t. 638.

LYCASTE DEPPÆI, Lindl., VAR. *PRÆSTANS*, L. Lind.

The variety is remarkable for the size of its flowers, whose outer segments are oblong-acute, greenish, thickly speckled with minute purplish spots; petals much smaller, whitish, enveloping the column. Lip small, included within the petals, three-lobed, anterior lobe lanceolate, lateral ones suborbicular, all yellow, with reddish-brown spots; t. 639.

COCHLIODA NOETZLIANA, Rolfe, VAR. *SUPERBA*.

An unusually richly-coloured variety, which has tasked the describer to give an accurate word-picture. Fortunately, the artist laboured under fewer difficulties, and his plate shows that this variety must be superb in its colouring; t. 640.

A NEW FRUIT.*

A BUMPTIOUS traveller once told the late Dr. Lindley that there were many splendid edible fruits in the Tropics he had visited. "Oh, yes," said the

with a dash of Melon thrown in, and when I say that it is to most others good fruit what *Stachys affinis* tuberifera is to most other good vegetables, my meaning will be pretty clear.

Having read of the *Salpichroa* or *Withamia*, fig. 133, as a new fruiting-plant last spring, I went to a good deal of trouble to get plants, but the result is not very encouraging. The plant belongs to the Solanaceæ, and so is a relative of the Potato, Tomato, Chili, &c. As to growth, the treatment usually given to Tomatoes indoors suits it very well, and we find it fruits most freely when pot-bound or starved a little, and the fruits set most freely in the open air, or when flies and bees obtain access to the flowers.

I send you fresh specimens showing flower and fruit, also a sketch of a flowering and a fruiting-spray.

After having obtained plants from Italy, as well as from a London nursery, I was a little surprised to find that the plant had been growing in a corner of the garden for at least the last twenty years. Once or twice indeed it spread so much that we had tried to dig it out, but its roots and stolons spread so fast that it always re-appeared. As thus rampant on a deep rich border, however, the plant runs all to stalks and leaves, and but rarely has flowers or fruits, but this year a few fruits were produced, owing

FIG. 133.—*SALPICHROA RHOMBOIDEA* IN FLOWER AND FRUIT.

Doctor, tartly, "and very few of them are worth eating, I suppose." Be this as it may, in such cases no one is really convinced without actual trial, and an actual trial of the much talked of "Œufs de Coque," fig. 133, convinces me that it is just worth tasting now and then, but that as a useful fruit it will, in British gardens, at any rate, rank a long way down below the Gooseberry, or even the wild Blackberry of our own hedgerows and fields or lanes.

It is a native of the Argentine, where it forms spreading masses on the bare hot ground, and fruits very freely. The plant forms a straggling, prostrate, bushy mass, its flexuose stems being set with soft small-rounded or ovate leaves, and in the axils of the upper branchlets little white, solitary bell-shaped flowers are produced, not unlike those of the wild Lily of the Valley in form and colour. The flowers are visited freely by flies and bees in our gardens here at home, and are followed by ovoid fruits about the size of a small Olive, the skin being, when ripe, pale yellow, and filled with soft pulp and seeds. The flavour of the soft, ripe fruits is, by some, very much liked, though others do not care for them. To me, they taste like a combination of Nectarine and Pine-apple,

doubtless to the hot season. It is just worth cultivation as a botanical curiosity, but so far as I can see its fruit will never become of any serious economic value. [Agreed! Ed.] F. W. Burbidge.

LAWSON, AND HIS WORKS.

(Concluded from p. 435.)

It is remarkable that Lawson betrayed a consciousness of the reason why a leaf falls; and though he did not put it in practice, a clear perception of the value of root-pruning. It was his desire that every seventh year the orchard should be surface-dressed with a thick layer of rotted manure. Neglect of this dressing he thought to have been the "chief cause why so many orchards are evilly thriving." A lengthy list of annoyances with their several antidotes, furnish a whole chapter. Things have changed since then, for mention is made of "Deere, Goates, Cattell, Horse," as well as "Bullfinch," and "Canker," and, perhaps worst of all "A careless master, and an indiscreet, negligent, or no keeper!"

Another chapter is devoted to the demonstration, by a series of curious arguments of the certainty of trees of all kinds continuing in a fruitful condition for not a few years only, but for many centuries; the Apple for at least ten! Remarks on gathering fruit

* *SALPICHROA RHOMBOIDEA*—Miers, in *Hook. Lond. Journ. of Bot.*, iv., 1845, 321 (Solanaceæ).

are to the point: "Apples are known to be ripe partly by their colour, growing towards a yellow, except the Leather-crat and some Peares and Greening." "No keeping-fruit" is to be gathered "before Michael-tide. Hard winter-fruit and Wardens longer."

does not despise vegetables nor Saffron and "Lycoxas;" but these do not fulfil his ideal of an orchard. "Methinks, hitherto we have but a bare orchard for fruit, and but halfe good so long as it wants these comely ornaments that should give beauty to all our

we descend to the humdrum language of *The Country Housewife's Garden*, which is a sort of addendum to *A New Orchard*, and forms a very short contribution to the current gardening literature of the first James. Its first chapters are merely paragraphs containing little of interest. Several rude knots are engraved, but these disappeared from the later editions. There was a flower-garden and a winter or kitchen-garden, but these displayed very slight distinctive features the one from the other. Many Herbs found a home among the flowers, and in like manner flowers overflowed into the vegetable ground, all the plots of which were edged with flowers, such as Daisies, Pinks, Lavender, &c. The taller plants, of which Hollyhocks and *Malva crispa* are examples, were cultivated in side borders.

A large number of kitchen-garden herbs were aromatic, many of which are not now grown, as in the case of "Alexanders" which have been supplanted by Celery. Cabbages are mentioned in two sorts. "Of this herb, called Cole, our country housewives give their pottage their name, and call them Caell," a dish which Scotchmen and the natives of the north of England will not fail to recognise.

"Of Peny-royall, or Pudding-grasse" it is de-

FIG. 134.—ANOTHER NEW FRUIT:—FEIJOA SELLOWIANA: FLOWERING SHOOT.

FIG. 135.—FRUIT OF FEIJOA SELLOWIANA: YELLOWISH-GREEN, RICHLY PERFUMED.

clared to be good for the pot, or "hacket meate, or haggas pudding." The "great chieftain o' the pudding race" is generally considered a dish purely Scottish, and indulged in by Scots on great occasions only. But the above and other references show it to have been a not uncommon part of the menu in all parts of England, except perhaps near the metropolis. On very insufficient grounds, it has been recorded a French introduction.

A chapter of general rules closes this brief commentary on small gardens; and the remaining portion is occupied by an essay on "The Husbandry of Bees." R. P. Brotherton.

ANOTHER NEW FRUIT.*

To our distinguished friend, M. Ed. André, the editor of the *Revue Horticole*, we are indebted for specimens showing the foliage of this tree, and for the opportunity of tasting the fruit. From the material supplied by M. André, and from the coloured plate in the *Revue Horticole*, we have prepared our illustrations (figs. 134, 135). The *Feijoa Sellowiana* is a South Brazilian Myrtaceous plant, with thick, leathery foliage, covered with fawn-coloured down on the under surface. What the flowers and fruit are like may be judged from our illustrations; but to attempt to convey any description of the flavour of the fruit in

"Gather the stalks with all; but not the stumps that must beare the next fruit; nor leaves, for moisture putrifies."

In the seventeenth chapter "Ornaments," which I have touched upon in a previous communication—Lawson is at his best. He is grateful for fruit, and

labours." By degrees, the orchard he began to plan has culminated in a garden enclosed where the pleasures of the simplest and purest nature were provided. It was full of "all delights," and an honour to the aged Englishman who planned it.

From the deliciously quaint English of "Ornaments"

* *Feijoa Sellowiana*, Berg., in *Linnaea*, vol. xxix. (1858), p. 258; André, in *Revue Horticole*, vol. lxxv. (1898), p. 264, c. c. colour; Hook. f., in *Bot. Mag.*, t. 7620; *Garden*, 1898.

words would be futile. Suffice it to say, that it is—well, it is “fruity,” acid, aromatic, spicy—we will add only one more adjective—delicious.

The plant was introduced by M. André himself from Uruguay, and the specimens sent to us were ripened in his garden on the sunny shores of Golfe Juan. The residents of that enchanting district therefore have, thanks to M. André, another attraction to the many they had before. In this country a warm greenhouse treatment would suffice, and the method of cultivation required for *Eugenia Ugni* would probably be quite suitable in this case. The petals are hooded, fawn-coloured externally, purplish-crimson within. It would be a valuable introduction into most of our sub-tropical or warm temperate colonies, and will, we trust, secure a more lasting appreciation on the part of the public than has been the case with the *Eugenia Ugni*. Unlike other Myrtaceous plants, the stamens are straight, and not coiled up or twisted in the bud.

“THE ARISTOCRAT” ONION.

As a cross between Ailsa Craig and Rousham Park Hero, “The Aristocrat” will be welcomed as a great acquisition, as much for its large size and handsome appearance as for its long-keeping qualities and delicate flavour. It has been carefully selected for the past four years, and comes very true to type, which is a deep flat—in fact, approaching to a globe-shape. In colour, it is a light straw; neck, very small; shoulder, well up; very solid in texture. It will also prove valuable for ordinary spring sowing, from its great solidity and good keeping qualities. It can be grown to 3 lb. in weight. The bulbs in our illustration (fig. 136, p. 453) averaged 2½ lb., with a girth of 18 to 20 inches. We are indebted to the kindness of Mr. Deverill, of Banbury, for the photograph from which the figure was taken.

MARKET GARDENING IN THE CHANNEL ISLES.

THE development of traffic between the Channel Islands and the ports of Southampton and Weymouth, must be seen to be thoroughly understood. To say that steamers run backward and forward every day, conveys but little to our stock of knowledge, and the bare statement soon slips from the memory; but to see the vessels arrive at Weymouth, freighted with their numerous packages, and to observe the empties as they are unloaded at Guernsey and Jersey, is such a suggestive sight, that the recollection of it cannot easily be effaced, nor the interest and pleasure soon forgotten.

It was on Tuesday, August 23, when standing on the quay at Weymouth, about 5 P.M., that the Great Western Railway Company's steamer *Lynx* entered the harbour. Some fifty men were quickly at work; the officials superintending the unloading, the men handing out the baskets, of which there were nearly 18,000, each weighing from 10 to 14 lb. apiece. These baskets had been carefully packed mostly with Tomatos, and came chiefly from Guernsey. As the baskets were handed over the vessel's side, they were placed on the quay and sorted for the different towns to which they are directed, and straightway were packed again in the luggage-vans of the Great Western Railway trains, that are run on rails right along the landing-stage. There were packages destined for no fewer than sixty-five different towns in this particular cargo, the large towns in the Midlands and the North of England taking by far the larger portion; such places as Manchester, Liverpool, Sheffield, Birmingham, having one or more trucks exclusively. The scene was a lively one, as each man endeavoured to keep to his allotted duty, and hand on his package as rapidly as he could. Beside the baskets filled with Tomatos, there were many large boxes containing fruit; these are lifted out by the cranes and packed into the trucks to which they are specially consigned. The entire cargo is soon unloaded and on board the train, so that in most cases the goods will be delivered the following morning. The bustle and activity of one such boat is repeated every day, sometimes

twice a day; the special cargo vessels bringing, of course, larger consignments. Similar busy scenes may be observed at Southampton.

GUERNSEY.

A few days afterwards I took passage by the G.W.R. steamer, *Ibez*, had a most pleasant trip across the Channel, and after a run of just four hours, arrived at the harbour of St. Peter's Port, Guernsey, where the first halt is made. Here the first thing that struck one on landing was the large stacks of empty baskets, and the number that were being taken from the vessel just in. Here the baskets, tied together in fours, are sorted, and placed in heaps, and during the daytime they are carted away to their respective owners, ready for packing again.

In the evening I strolled into the town, and one of the things that arrested my attention was a tall stalk, some 18 feet high, with shoots 3 feet in length, fastened just outside a tobacconist's shop. This was really a Jersey Cabbage-stalk. This I was given to understand was an exceptionally fine stem. The average height is about 10 feet, as I had plenty of chances of observing a few days later, when visiting Jersey. As is doubtless well known, these Cabbages are grown chiefly for the cattle, and the leaves are constantly being stripped off, and given as forage to the cows tethered in the meadows, as they are here. The Cabbage continues to grow in height, and when a height of 8 or 10 feet is reached, they are pulled up and dried, then cut into lengths, dressed, varnished, and mounted, and sold by hundreds as walking-sticks—and useful articles they are, many visitors taking back with them bundles of sticks, retaining or distributing them among their friends, as souvenirs of their visit to the Channel Islands.

I find that during the first week in August one vessel, the *Dora*, arrived at Southampton from Guernsey with over 19,000 baskets of Tomatos, &c., and another with 1,000 packages of Grapes and plants; the *Lydia* with 9,000 packages of plants, fruit, and Tomatos from the same island. While to Weymouth the Great Western Railway boat, *Lynx*, brought over 16,000 packages from Jersey and Guernsey, and the *Gazelle* carried over 25,000. This will give some idea of the regular traffic, and besides those boats already mentioned, there are others trading to Weymouth and to Southampton.

The Tomato industry of Guernsey is now a well-established and most important one, and the culture of Grapes would seem to be almost on a par with it, whilst early Beans form a most valuable crop, and as might be expected much attention is now given to their culture. Guernsey devotes, doubtless, more space and labour to these specialties than is the case at Jersey; there the conditions are much more favourable to fruit growing, and as a consequence, Grapes and Pears are grown in a manner and in such quantities that it is a great pleasure to see them. The aspect and surroundings of the town strike one as being somewhat curious, scarcely foreign, yet different to what one has hitherto been accustomed. The inhabitants are a busy, thrifty race, always on the go, steadily pursuing their labours, with a considerable air of independence about them. That the natives have made great advance in the culture of these products, have added house to house, until in some districts almost every available spot seems covered with glass erections, will strike the casual observer as he journeys just only a little distance from the esplanade; but to see the extent and the working of the business, one must pass through the various establishments, and without asking too many questions observe the methods, ways, and practices, and make a note whenever practicable. Many, however, are quite willing to impart information, and I am indebted to them for the privilege of passing through their extensive premises. I visited many, and if all names are not mentioned, it is no intentional discourtesy.

There is great similarity in the methods of the many growers, and a description of one will often be just what one would like to have said of the next one visited. The number of glass-houses on the island is very large, and fresh ones are being con-

stantly erected; for it would seem there are fair returns and satisfactory results in Grape and Tomato growing even yet. One day I was taken to one of the pioneers in Grape and Tomato culture, Mr. Martin. Some of the houses here would now be considered small, as they are but 100 feet × 16 feet, a lean-to; or 150 feet × 40 feet span; 100 feet × 30 feet, 210 feet × 30 feet span-roofs; and others of similar dimensions. The size of these houses is, of course, regulated by the space of ground that can be set apart for them, for all growers have not the unlimited area that some of those of more recent development possess. From this place, during the season, some 2 cwt. of Grapes are sent away almost every day; some of the houses had the crops all gathered, and in others a good portion was cut; later houses were coming on, and here fine crops were hanging that were quite up to the top-mark. Fine bunches of Black Alicante and Gros Colmar, large berries, and colouring well.

TOMATOS.

Of Tomatos, there are also very large quantities grown; and if the houses here are somewhat less in size to many others, the method of culture pursued here is just that what is adopted in almost all others. Houses some 200 × 36 feet will have a path trodden right through the middle from end to end; then on each side, there being no stages, the ground is well dug and enriched, and generally twelve Tomato-plants are put in from path to wall, and a similar number on the opposite border—thus, twenty-four plants reach right across the house. These rows are 3 feet apart, leaving sufficient space to pass along to attend to the plants, watering, &c. As the plants grow, they are secured to strings fixed to the roof, and fastened by a peg in the soil, so that each plant is kept to its separate support. The plants are allowed to run up some 6 and 8 feet, all side-shoots are picked off, and every encouragement is given, with sun-heat, manure-water, and fertilisers, to develop strong plants and healthy foliage. Clusters of fruit quickly form on the lower part of the stems, and growth advancing rapidly, the fresh clusters appear, and the first fruits will begin to colour.

When a number of such houses are devoted to the Tomato, the gathering of the fruit, the grading, packing, and dispatch to the steamer's side is a busy and most important part of the day's duties. The weight from one house I was informed had been no less than 6 tons, and from the earliest consignments in May right up to the late autumn the same processes are carried on.

The fruit outside follows immediately that grown under glass, and though not uniformly so large, is nevertheless good marketable produce.

Into another establishment I wended my way, and found the whole of the houses, which are of great length and width, occupied with Tomatos. In some, the crop was cleared out completely, and preparation would soon be made for Potatos; in others, a late batch of Tomatos were planted, and were just setting fruit. From 22 to 23 tons of Tomatos, I was told, had been sent out in one season from this place.

BEANS, ETC.

A profitable part of the business now, and one that fills most advantageously some spare time, is the growing and dispatch to the mainland of Runner Beans; but Sutton's climbing Bean, Canadian Wonder, and Zebra, are sorts very often mentioned. These are grown like the Tomatos, running them up on strings, and bringing them into a bearing condition as rapidly as possible. These are started very early in the spring, and occupy the houses for three or four months as the case may be, and from 1 to 4 tons during the season is by no means an exceptional quantity to gather on a place not considered one of the largest. The prices obtained for these early Beans would warrant an even greater quantity being grown; but as it is, where the house can be spared even for a short time only, a sowing will be made, and a crop secured. It is singular to notice the fondness with which many growers cling to their special variety of Beans and Tomatos; of the latter the large round being the favourite, and when of

one's own saving, why then, of course, so much the better.

In another establishment I found that Beans and Tomatos were the principal items, with large quantities of Chrysanthemums in pots, also breadths planted out for the supply of cut flowers for export.

On the following day I was permitted to inspect some houses 300 feet by 40, where Grapes are grown in splendid style, the greater portion of the goods from this particular firm being consigned to Mr. G. Monro, Covent Garden. Beans and Tomatos also in their respective houses, and Chrysanthemums in pots and beds occupying much room. From another I gathered information that leads me to believe that the proprietor, who rejoices in a thorough Lancashire name, is rather more diverse in his energies and labours, for in his place 30 tons of Tomatos, 7 tons of Grapes, 4 tons of Beans, besides Cucumbers and Melons, are grown in houses, many of which are

well-shouldered, berries of large size, and finely coloured. This house is just a model.

From this I passed to a lean-to vinery, 700 feet by 18 feet, in which just 456 canes were planted twenty-two years ago. No special preparation had been made in the border outside, where all were planted in the ordinary soil, and brought into the house through small holes in the front wall, which is about 18 inches high, from which the rafters rise to the back wall. This house is unheated, no pipes being fixed anywhere, so the canes start into growth about February, and come on gradually, the various processes of thinning, tying, &c., are carefully attended to, each operation, as may be imagined, taking a considerable amount of time. To look through this house, with its wonderful crop, which will run to five tons and more, is a sight not soon forgotten. Everyday consignments are sent to London, for as soon as the crop is fit the cutting commences, and is

might say fields, devoted to their culture. Tens of thousands of sort after sort are now being planted in quarters specially prepared. This industry is increasing every year, and bulbs of the finest varieties are grown to a large extent; whilst the heaps of bulbs in the sheds and cold vineries is astonishing. As quickly as the ground can be prepared, they are taken out and planted.

CHRYSANTHEMUMS.

The thousands of choice Chrysanthemums in pots, uniform in height, stout, and vigorous, are also a very important item in the business of this firm, for every good thing that can be assured of quick sale is grown in quantity and in excellent style. Show blooms are not grown, but good market flowers, plenty of them, from October onward, as long as can possibly be managed. Large quarters are planted with Chrysanthemums, and were 3 feet high, carefully secured by stakes and strings.

FIG. 136.—A DISH OF THE "ARISTOCRAT" ONION: THE BULBS AVERAGING $2\frac{1}{2}$ LB. IN WEIGHT (SEE P. 452).

300 feet long and 45 feet wide. A grand lot of Black Alicante was being cut and sent away every day; these would be followed by a heavy crop of Gros Colmar, colouring splendidly, without the aid of fire-heat—or but a small amount, if the nights should prove to turn in cold.

GRAPES.

At the Longfield Nursery I was fortunate in meeting Mr. A. T. Hansford, who has vineries that this season have done remarkably well. This place is in good keeping, there being some nice flower-beds, very gay, with capital Palms, Dracænas, &c., planted in beds and borders. I first entered a house 65 feet by 40 feet, full of Black Alicante; these were planted six years ago, and now are in splendid bearing condition. The house, which is span-roofed, has forty canes on each side, and according to the rate of space already cleared, just a ton and a half is the weight that will be taken from this roof. Here the crop hangs in superb condition, many of the bunches being fit for the exhibition-boards—regular in size,

continued till finished. The first bunches in this house were cut on July 26, and by the end of September all would have been cleared away.

Three more establishments were visited, where houses of 100, 200, and 300 feet by 40 were utilised for Grapes, Tomatos, and Beans, each following one another as rapidly as possible.

DAFFODILS, ETC.

Besides the articles mentioned, there are the Daffodils, Iris, and Freesias, the former in large beds and fields, the work of planting now proceeding; the Freesias put in boxes, a hundred or more boxes at a batch, whole pits and frames filled with them, in which thousands are already well up, making strong growth—many of these would be stood on the vinery floors, and bloom will soon make an appearance.

A visit was also made to Mr. Weeton's, where an immense quantity of Daffodils is grown, choice sorts by the thousands; Sir Watkin, Empress, Emperor, and others, even more rare, have large beds, one

A large portion of these would flower where they were, the flowers being of fair size and substance.

TRAVELLING GREENHOUSES.

A new departure in buildings is being adopted here, viz., travelling greenhouses (see *Gardeners' Chronicle*, May 26, 1894, fig. 83). These are 60 feet by 25 feet, and as structures appear to be all that could be desired. When building operations commence, the space to be utilised is first set out, when stout low pillars are built, on which a strong iron rail is fixed, the whole of the structure rests on these rails, on stout grooved wheels, and the ends, in which are the doors, are stoutly boarded, and so are stronger than if glass were used. I was assured they can be moved along quite easily, and have proved to be most serviceable. For bulb culture, and the hastening of flowers for cutting, the plan is to draw the house over one portion, and hasten the crop on this part, then, when this is finished, to draw the cover along to another part full of plants, which were planted

between the rails, and hasten and secure this second lot, and then draw it on to a third piece. If a house is, say, 60 feet in length, the piers and rails will run for, say, 180 feet, by which means three spaces of equal length can be utilised; of course, it remains to be seen whether the plan is profitable enough to warrant still further adoption. Some houses have boiler and pipes fitted, which travel with the houses, these under notice have none at present. The Horticultural Travelling Structures Co., Ltd., would seem, by their prospectus, to be willing to erect these houses anywhere, and adapt them for any purpose. *Our Special Commissioner.*

(To be continued.)

THE HARDY HEATHS.

(Continued from p. 432.)

E. ciliaris.—Belonging to the same section of the genus as *E. Tetralix*, this species may, however, be readily distinguished by the leaves alone. These are borne three together (not four) in a whorl; they are ovate, and broader, and the margins are less revolute. The plant does not grow much more than a foot in height, but has long, wiry, straggling stems. The flowers are borne in an often elongated raceme at the end of the stem, the corolla large and rosy-purple. The species is a native of Britain, but is not common; it has been found in Cornwall, in Dorset, and in Galway. It flowers at the same time as *E. Tetralix* (July onwards), but near London is a less satisfactory plant under cultivation; this, however, is probably owing to its sensitiveness to smoke and fog, for in the neighbouring counties it thrives admirably, and is a beautiful plant.

E. cinerea.—Some of the loveliest colours to be found among the hardy *Ericas* occur in the varieties of this species, whose flowers range from pure white to rich purple and red. It is a British plant, and is widely spread over the kingdom. I have seen it, although never in large masses, on the Yorkshire moors, also in Devon and Somerset, where, on the contrary, it is very plentiful. On Exmoor it grows along with the dwarf Gorse (*Ulex nanus*), the two often growing together, and forming one close, cushion-like tuft. Flowering at the same time, they make a delightful combination of purple and gold. Near Porlock and Dunster, one may walk for miles and never be out of sight of these charming plants, which are at their best in August. *Erica cinerea* is a glabrous plant 6 to 12 inches high, with tiny dark green leaves often only one-eighth of an inch long, and borne in whorls of three. The flowers appear in dense racemes 1 inch to 3 inches long, and are typically of a bright reddish-purple. There are some half-dozen colour varieties offered by nurserymen, every one of which is worth growing. The best of them perhaps are atropurpurea and atropurpurea. A curious variety was discovered in 1897 by Mr. E. M. Holmes. In this the corolla is cut into several segments, sometimes almost or quite to the base, making it polypetalous. We propose to call it var. *polypetala*. The species is quite hardy, but with us it is not so strong and thriving under various conditions as the spring-flowering *E. carnea* is.

E. lusitanica (*E. codonodes*).—The species with which this is most likely to be confounded is *E. arborea*, both having hairy stems, and much the same general appearance. It may possibly be a geographical form of that species. It differs in the following particulars:—The wood is not so hairy as in *E. arborea*, the foliage is denser, and the individual leaf finer and more slender, whilst the corolla is not only larger, but more truly bell-shaped than the globular one of *E. arborea*. It has been known to attain a height of 10 to 12 feet in Sussex, but owing to its being unable to withstand our hardest winters, it is only in the most favoured localities like the Sussex coast and Cornwall that it ever gets so large. The flowers are white, with sometimes a tinge of pink, and have a slight vanilla odour. It flowers from February to May. The wonderful profusion of its blossoms, together with their purity and grace, make this one of the loveliest of early-flowering shrubs; especially in mild localities. It comes from Spain and Portugal.

E. Mackaii (Mackay's Heath).—This plant is very nearly allied to *E. Tetralix*, but differs in the following characters:—The leaves and sepals are both ciliate, as in *E. Tetralix*, but are quite devoid of down; its stems are more inclined to branch near the top; the corolla (of a pale rose) is shorter, and broader. The arrangement of the leaves and flowers is the same. By some authorities this is made a variety of *E. Tetralix*. It was first found between Roundstone Bay and Clifden, in co. Galway, Ireland, and has since been collected in Spain. It is a variable plant, and some of its forms closely approach *E. Tetralix*, but it is always charming, and succeeds admirably under cultivation.

E. Maweanæ ×.—Like the better-known *E. Watsoni*, this is supposed to be a hybrid between *E. ciliaris* and *E. Tetralix*. It has the ciliate leaves of the former, with their glaucous under-surface, but is a sturdier plant. The flowers are large, purple-crimson, and produced in dense cylindrical racemes. Whilst, of the supposed parents, *E. Watsoni* more nearly approaches *E. Tetralix*, this leans towards *E. ciliaris*. It is a very beautiful plant, evidently rare, and discovered in 1882.

E. mediterranea.—The specific name of this Heath appears to have been given to it by Linnaeus under a misapprehension, for, according to Moggridge—the author of the *Flora of Mentone*—it is never found on the shores of the Mediterranean. It is, rather, a Biscayan plant, being a native of south-west France (Gironde, &c.), and Spain. A form of it is also found in the west of Ireland (counties Galway and Mayo). It is as hardy as any of the South European Heaths, and gets to be 5 to 6 feet high; Loudon notes a specimen at Sion which was 10 feet high prior to the great winter of 1837–38, but was then killed to the ground. It is quite glabrous, and its leaves are in whorls of four or six. The flowers are borne in the leaf-axils near the ends of the shoots, making a crowded terminal raceme; they are pitcher-shaped, and bright rosy-red. There is a fragrant white-flowering variety (*alba*), and another, very distinct, with glaucous foliage (var. *glauca*). The species and these two varieties flower from March to May.

Var. *hibernica* (syn. *E. hibernica*), is the form alluded to above that is found in the west of Ireland. It differs chiefly from the Continental type in its shorter, wider corolla, and in being less tree-like in habit—it is from 1½ to 5 feet high. It is also rather later in commencing to flower.

Var. *hybrida* (or *E. hybrida*).—Some authorities, acquainted, I should imagine, with dried specimens only, have considered *E. mediterranea* and *E. carnea* to be the same species. No doubt they are closely allied—David Don placed them, along with *E. vagans* and *E. multiflora*, in a separate genus called *Gypocallis*, because of the exerted stamens and other characters—but a connecting link between them is furnished by this variety. From the name one would conclude it was a garden hybrid, but if so, I have not been able to find by whom it was raised. Possibly it is a wild form intermediate between the two, although it flowers much earlier than either. In any case it is a most beautiful and useful Heath, worth growing in large masses for winter effect. It is a stronger and taller grower than *E. carnea*, but still dwarf. It is generally nicely in flower by early December, and continues in beauty till April and May. This season some of its flowers were open in the first days of November. *W. J. Bean, Arboretum, Kew.*

(To be continued.)

THE WEEK'S WORK.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Newly Planted Trees.—The mild weather has been in favour of all recently-planted fruit trees, but severe frosts come in the months of January and February, so that all transplanting should be now completed. Standard fruit trees should be securely staked, in order to prevent wind-waving, for, if allowed to rock about, a water-holding receptacle forms at the collar, and when the water freezes, much damage is done to the trees. The best form of support for

standard trees consists of two stout stakes, one on each side of the tree, driven into the soil about 9 inches from the stem, and reaching as high as the lowest branches, and a cross-piece is nailed to them about 2 inches below the tops, and the stem is secured to this with tarred cord, a piece of india-rubber hose being wrapped round the stem to prevent injury to the bark. Sometimes hay and straw serve the same purpose, but these things harbour insects, and are therefore objectionable. The lower ends of the stakes should be charred, and then dipped into boiling tar or creosote to increase their durability. Some secure protection against hares and rabbits and cattle should be placed to all fruit trees in orchards and fields, using against the rodents wire-netting placed 3 feet high around the stem, and let into the ground 4 inches. If left 2 inches clear of the stem it will serve for several years; more room than this would allow rabbits or hares to jump inside and gnaw the bark. When brought 4 feet up the stem it is a protection against sheep. To ward off other animals it requires wooden or iron tree-guards, which add much to the cost of planting orchards, and it is well to find other quarters for the animals. The soil round about trees recently planted should be mulched off before it gets frozen, with partially-decayed litter from the stables or cow-sheds, and, failing this, half-decayed leaves may be used instead.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorset.

Odontoglossums.—At this season many of the species of *Odontoglossum*, namely, *O. crispum*, *Halli*, *triumphans*, and *hystrix* show their flower-spikes, and if slugs and snails exist in the house it is very necessary that the gardener search for them at night when they are feeding, otherwise many flower-spikes will be damaged or lost. In most collections are some valuable *Odontoglossums*, and of all these should be stood on flower-pots inverted in pans filled with water, and even then a constant watch is necessary, for slugs may lurk in the potting material. A piece of wadding may be wrapped around the base of the spike as a further defence against these marauders. *Odontoglossum citrosimum* in its cultural requirements and in its mode of flowering differs from other *Odontoglossums*; and it demands, when in full growth, to be hung up in a very light and airy position in the Cattleya-house, but at this season, growth being at an end, the plant is the better for a slightly more moderate degree of heat, and a comparatively drier air. In order to successfully bloom the plant a long period of rest is needed. Hang the plant in the full sunlight, and as the pseudo-bulbs mature afford less and less water, until the supply ceases. The pseudo-bulbs will soon shrivel, but shrivelling does not affect the welfare of the plant. Sometimes a few of the plants will start to grow again in the winter, but if they are treated similarly to the other plants at rest such growth will scarcely advance at all, and will seldom fail to produce flower-spikes at the right time. *O. Reichenheimi* and *O. laeve* should also be afforded a long rest after the swelling of the new pseudo-bulbs is finished, but these must not be allowed to shrivel greatly. Plants of *Laelia autumnalis*, *L. alba*, *L. majalis*, and *L. Marriottiana* should, now that their new growths are fully ripened, be hung close to the roof at the warmer end of the cool-house, and not be afforded any water unless the pseudo-bulbs commence to shrivel, which they rarely do, owing to the moist conditions maintained in this division.

Masdevallias.—Amongst *Masdevallias* which bloom at this season, the white *M. tovarensis* stands out conspicuously, with flowers arranged compactly and without stiffness on the top of a stem varying in length from 4 to 8 inches. These spikes, as is now well known, if not cut below the scape from which the flowers spring, will produce flowers the following year; but it is not advisable to retain these old flower-spikes, as without doubt their retention tends to weaken the plant. To do this it is necessary to cut the flowers with so short a stalk as to render them almost useless. Being a compact-growing plant, and throwing its spikes of three or four flowers well above the foliage, this *M. tovarensis* is a valuable decorative plant. Unfortunately, for this purpose the plant suffers from the aridity of the dwelling. In an intermediate, airy house the flowers last in perfection for five or six weeks. *M. tovarensis* may be grown well in pots, which must be properly drained with crocks and charcoal, brought up to within 1 inch of the rim. Over this a layer of sphagnum-moss should be laid, and the plant fixed

in a conical mound of equal parts of fibrous peat and fresh sphagnum-moss, many of the heads of the latter being kept at the surface, so as to form a living mat of moss. Avoid potting the plant tightly. As regards temperature, that of the cool Odontoglossum-house, or a shady frame form suitable places from April till October, and the intermediate-house from October till April. During the time the plant is in the intermediate-house, it should be kept near the glass on the shady side, and receive air on all favourable occasions.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Zonal Pelargoniums.—The double and semi-double flowered varieties open their flowers more satisfactorily when afforded a somewhat higher temperature than is found necessary with the single-flowered varieties; a temperature 5° higher is found quite sufficient. Plants that have been kept in a greenhouse may now be afforded 55° of warmth. With the present damp and close weather ventilation is very essential, dampness being very injurious, and must be counteracted by the use of the hot-water pipes, together with a modicum of air afforded by the upper openings. Weak manure-water afforded occasionally, and a little artificial manure sprinkled on the soil assist the plants considerably.

Palms.—Work in general not being now so pressing, a good chance is afforded the gardener to thoroughly overhaul his Palms, most of which will have become infested with white scale. It is well, as has been said in an earlier Calendar, to syringe the plants a few hours previously to commencing with a weak petroleum emulsion, which is made by adding a wineglassful of the oil to a strong lye made of soft soap, as this renders the dirt and scale easy of removal. The cleaning is best effected with a bit of sponge, a tooth-brush being found useful for cleaning parts the sponge cannot reach. Where *Seaforthias* and other intermediate-house species are grown with those requiring more warmth, the plants should be closely examined for Thrips, as these, if not destroyed on their first appearance, soon disfigure the leaves. *Kentia Fosteriana* and *K. Belmoreana* will stand more rough treatment than most other Palms. *Phoenix rupicola* makes a handsome vase plant, but it is slow of growth in the early stages. *P. reclinata* and *P. dactylifera* are useful species, growing to a large size if afforded the necessary root space. *Cocos Weddelliana*, *C. plumosa*, *Geonoma gracilis*, *Areca lutescens*, *A. crinita*, and *Latania borbonica* are all good and beautiful decorative Palms. No repotting of Palms should be performed before May, unless the state of the soil is very bad.

Abutilons.—The flowers of the different varieties are of use in table and other decorations, and the yellow ones especially so; and in order to have some of them soon some healthy specimens may be placed in the intermediate-house, where they will soon show flower, and continue to bloom for several months. If *Abutilons* can be planted out in a cool house in the summer, and afforded gentle warmth in the winter months, they yield a large quantity of flowers over a long period of time. Cuttings of *Panicum variegata*, *Selaginellas*, the creeping *Tradescantias*, *Pittonias*, *Pilea muscosa*, and *P. muscosa nana* should be struck in quantity for indoor decorative work.

Libonia Penrhosiensis.—Where large plants are desired, cuttings should be rooted early, and if two or three plants are cut back slightly and placed in the stove, shoots fit for making cuttings will soon be obtainable.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford, Kent.

Aquilegias.—These hardy perennial plants are worthy of a foremost place in the border, and not being particular as to soil. The foliage of the *Aquilegia* is of an ornamental character, the flowers are exceedingly beautiful, light, and graceful, and especially useful when cut for filling vases, &c. *A. californica* grows from 2 to 3 feet high, possesses flowers of a shade of scarlet; those of *A. glandulosa* are of a rich blue, with a white corolla, a very fine variety; *A. chrysantha* has flowers of a golden yellow tint, the spikes of the bloom being of considerable length. It reaches a height of 2 to 3 feet; and when plants are left undisturbed for some years, they form bushes sometimes 3 feet in diameter. *A. alba* is the white-flowered variety. In *A. coerula* we have violet, blue, and white flowers abundantly produced

A. Skinneri is a dwarfier plant than the others, and the colours in the flowers are red and green. *Aquilegias* may be planted, provided the clumps are strong, at this season, otherwise early in the month of March is a better date. Small plants reared in pots may be put out in the borders in April. Slugs are very partial to the young plants, but do no harm to old clumps.

Anemone japonica.—This is a good border plant, looking equally well on a rockery, or a clump on the lawn. The plant in all its varieties spreads fast by means of underground rhizomes, and needs, therefore, ample space. It does not like removal, and knowing this, a good preparation of the soil is very necessary, especially deep digging and manuring, and if a good proportion of peat and leaf-soil be added to the staple, the results will be the more satisfactory. There are rose, red, and white varieties, and a few double-flowered varieties, but none is so pretty as the white single-flowered one. In good soil they reach a height of 3 feet.

Delphiniums.—A loamy soil of good quality, enriched when necessary with manure or leaf-mould, and the plants left undisturbed for years, suit the requirements of these best of all hardy blue-flowered perennials. The pale blue-coloured varieties, when planted in large clumps, make a splendid display; and all are useful in the garden. The varieties may be dug up and divided and planted at this season; a succession of bloom may be obtained by dividing and planting at different times. After planting mulch with leaf-mould or short manure. *Delphiniums* produce seed freely, which may be sown in beds in the open air. Rare species and varieties may be struck from cuttings of the succulent shoots taken when they are 6 inches long, and struck in pots filled with sandy soil, or in beds under hand-glasses or cold frames.

General Remarks.—In some parts of the country the mowing-machine will be required to give the lawn a smooth appearance. Leaves should be swept up and wheeled to the leaf heap; but when collected among shrubs in any quantity, it is a good practice to sprinkle soil over them, so that the wind cannot remove them. They will then form good manure for the shrubs. See that the transplanting and planting of all kinds of deciduous shrubs and trees are finished at an early date in March and April.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Vegetables growing in Pits and Frames.—It is very essential that the glass should be kept clean at this dull season, so as to admit all the sunlight possible. Beyond this much care is required in affording water, and while taking care that the plants do not suffer from lack of moisture in the soil, no more of it should be applied than is actually necessary, and that in the forenoon. The more tender kinds of vegetables in frames should be protected at night if frost be imminent. If hot beds are in use, the heat must be maintained by linings of warm dung prepared in readiness. Cauliflower plants in cold frames and pits should be freely exposed to the air at all times when it does not rain or freeze.

Forcing Department.—Continue to place roots of *Asparagus*, *Seakale*, and *Rhubarb* in heat, in quantity sufficient to meet the demand. By whatever method *Seakale* is forced, the degree of warmth should be kept steady at 60° to 62°, with aerial moisture in moderation, and total darkness maintained in the structure, be it Mushroom-house, hot-water pit, or a simple excavation in the ground. The same holds good of *Rhubarb* when forced, excepting that for the present 58° to 60° is a more suitable degree of warmth. Let the heads of *Seakale* be removed when 5 to 6 inches high. The pits or frames containing *Asparagus* should have a top heat of 65° and a bottom heat of 75°, the soil of the bed being afforded tepid water when it approaches dryness. *Seakale* and *Asparagus* shoots should be cut before they become drawn, and if not required for immediate use they may be stood in trays filled with water until wanted. Another lot of French Beans may be sown in small pots, or in a bed in a heated pit, following former directions. Cover thickly Mushroom-beds built in the open air or in unheated sheds. Keep up the supply of Tarragon and Spear Mint, by placing in a warm, moist house or pit, boxes or pots filled with the roots.

Spinach.—It is a good plan to place frame-lights or glazed Pea-protectors over a few rows of Spinach,

shifting them to other rows when the finest leaves are gathered. Our Spinach is dying wholesale. [See answer in Notices to Correspondents on this subject. —Ed.] Had it not been for Zealand Spinach, of which we have a good supply, we should have been almost without this useful vegetable.

Roots in Store.—On wet days the gardeners should be set to sort the stores of Onions, Shallots, Garlic, Potatoes for seed, and for kitchen use, removing those which are decayed or diseased.

Potatoes and other Roots in Pits.—Sufficient soil to prevent the entrance of frost and moisture should be heaped on the outside, and should hard frost occur this covering should be supplemented with straw or bracken.

Cabbage.—A few rows may be planted now; should the weather be open for a few more weeks, they will quickly root, and turn in use fully in early summer. Red Cabbage for pickling should now be cut.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of SALISBURY, Hatfield House, Herts.

The Cucumber-house.—The mild weather enjoyed of late cannot but have been favourable for the growth of the bine, and the fruiting of the plants. It has rendered the maintenance of a genial atmosphere less difficult than it would have been if the weather had been frosty. The range of the temperature may be from about 65° by night, to 70° or 73°, allowing with sun-heat a rise of 5° to 10°. If the days promise to be sunny, let the bine be syringed in the morning, but at other times it will be enough to damp the floors and the walls several times in a day. Keep the soil moderately moist. The ordinary routine must be followed in all other matters. Those plants which the gardener manages to keep in a clean and healthy condition until the middle of January, will start at about that time into a more vigorous growth, showing fruit freely; and when at length their energy is exhausted, their place will be taken by young plants. If greenfly infest the plants ever so little, use means to get rid of the pest without delay.

Musas.—Although the fruits of the commone varieties of Banana are imported into this country in large quantities, the plants may be grown where large stoves exist with but little labour, their requirements being equally met whether the plants are planted in big pots, tubs, or in brick receptacles. By the first and second methods the plants can be made to serve as decorative material; but it is when planted in borders or brick-chambers that the finest clusters of fruit are produced. The chief requirements of the *Musa* are heat, full sunlight, plenty of moisture at the root and in the air, a rich loamy soil, and good drainage. *Musas* may be grown at the back of a lean-to-house, or in the central part of a span-roofed-house, where the height is not less than 10 feet. In this country it is mostly *Musa Cavendishi* that is generally cultivated, although in tropical countries its fruits are considered of very little account. The natural mode of increase is by means of suckers, which, emitted from the root-stock about the time the bunch of fruit shows, should be detached when they have made sufficient roots to support them. If necessary, these may be potted or planted out forthwith, whichever method of culture be pursued. When in active growth, manure-water is beneficial if afforded at every third or fifth application of moisture, but during the ripening of the fruits no water ought to be afforded, but the plant should be treated like a Pine-apple plant carrying ripening fruit. As the plant is naturally short-lived, there is no need to afford it a distinct period of rest. The *Musa*-plants that are bearing or showing fruit, should have the number of suckers reduced to one or two at the most, and the stem that has borne fruit should be cut off at the ground-level when all of the best fruits have been removed. About 10 inches of the extremities of the bunch should be removed as soon as it is seen what the length will be, as the fruits at that end seldom attain to more than half-size.

PLANT PORTRAITS.

HYPERICUM MOSERIANUM. Garden, December 17.
IRIS JUNCEA and *I. JUNCEA* VAR. *NUMIDICA*. Garden, December 10.

LIATRIS ODORATISSIMA, Carolina Vanilla plant, herbaceous perennial Composite, with loose panicles of purplish flower-heads. *Meehans' Monthly*, December.

PEAR BEURRE PICQUET, a Pear with the flavour of the Napoleon. Season, September. *Bulletin d'Arboriculture*, &c., December.

ROSE, BERTHE GEMEN, H.P., white, sent out by Gemen & Bourg, of Luxembourg; it is a seedling from Marchioness of Dufferin. *Le Moniteur d'Horticulture*, December 10.

EDITORIAL NOTICES.

CHRISTMAS CLOSING.—We would remind our readers that our offices will be closed from 1 P.M. on Saturday, December 24, till 9.30 A.M., Wednesday, 27th. Communications through the post will be received as usual.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

THURSDAY, DEC. 29 { Continental Plants, Carnations,
Hardy Climbers, Roses, Dutch
Bulbs, &c., at Protheroe &
Morris' Rooms.

FRIDAY, DEC. 30 { Imported and Established Orchids,
at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—37.6°.

ACTUAL TEMPERATURES:—

LONDON.—December 21 (6 P.M.): Max., 43°; Min., 36°.

PROVINCES.—December 21 (6 P.M.): Max., 47°, Isle of Man; Min., 36°, Cromer.

The History of the Potato, &c. How our unfortunate forefathers got on without Potatoes it now passes the wit of man to conceive. They had Onions, flavoursome bulbs, no doubt, but in no way taking the place of the "noble tuber" as an article of food. When, at length, the Potato was introduced, it was a long time before it was adopted generally. In this matter it formed no exception to the general rule. So strong is the prejudice against innovations in articles of diet that those who make the attempt to introduce something new, no matter how good it may be, have to encounter the most discouraging apathy, if not actual resistance. Still, if an article is really good, and can be grown without undue trouble or expense, it will sooner or later, later rather than sooner, be adopted. It was so with the Potato, and with Rhubarb. Within our own time, the use of the Tomato has increased a thousand-fold. An article in another column will give some notion of the enormous quantities that come from the Channel Islands; the Canaries furnish vast supplies, whilst our market gardens near the large towns grow them by the ton. And yet a quarter of a century has not elapsed since a raw Tomato was considered nasty, and those who introduced the practice of eating them uncooked were looked upon as guilty of affectation.

The use of the so-called Chinese Artichoke, *Stachys tuberifera*, the cultivation of which was introduced from France, is slowly spreading among us, and we may hope that the culture of so excellent and productive a vegetable, and one so easily cultivated, may speedily be developed on a large scale. At present it is only used in soups, or boiled and served with white sauce; but a French cook would find a score of ways of dealing with it, and for our own parts, we find it in the uncooked state preferable to Radishes, in being less coarse. In this taste, however, we have at present but few sympathisers—at least, so far as we know.

Another vegetable-tuber that it was once thought might be used to supplement, if not to supplant, the Potato, is the Oca, or tubers of *Oxalis crenata* (fig. 137). Forty years ago this was introduced by the Royal Horticultural Society, and commented on in our columns.

At rare intervals since that period we have seen and tasted these tubers, which were once more brought under the notice of the horticultural community by Mr. HERRIN at the last meeting of the Royal Horticultural Society. Mr. HERRIN grows them without any special culture in the open quarters of the kitchen garden; so that if, hitherto, they have failed to find favour, it is not by reason of any difficulty in their cultivation.

The Potato has secured such a hold upon us, that none of the plants—yams, oca, Apios, or others—proposed as substitutes has any real chance of success till the land gets Potato-sick, or till the crowding together into one area of Potatoes, and nothing but Potatoes, fosters the development of contagious disease from fungus-spores, or destruction by eel-worms, wire-worms, or any other predatory members of the animal kingdom.

This being so, any literature concerned with the Potato is sure of attentive consideration,

FIG. 137.—*OXALIS CRENATA* TUBERS.

and will be perused by the gardener almost with as much avidity as in the case of the Vine. For this reason we are glad to bring under the notice of our readers a standard work in the French language by M. ERNEST ROZE.*

It forms a large octavo volume of four hundred and fifty-six pages, with table of contents, index, and one hundred and fifty-eight illustrative woodcuts, and one coloured plate. The book is well arranged in two parts, and seven chapters, and is easy to consult. The first part is devoted to the wild Potatoes, their introduction into Europe, and especially into France. In the second part the life-history of the plant is dealt with, and the diseases to which it is subject are enumerated. Details relating to cultivation follow, whilst the last chapter is devoted to the various uses to which the Potato is put as an esculent, or as yielding spirit or dextrose.

In the forefront of the work is placed a coloured reproduction of the Potato, with

* *Histoire de la Pomme de Terre, traitée aux points de vue Historique, Bibliographique, Pathologique, Cultural et Utilitaire.* Par ERNEST ROZE. . . . (Paris: J. ROTHECHILD.)

foliage, flowers, and two tubers, which now-a-days we should call small and mis-shapen. This drawing is the earliest document we possess relating to the introduction of the Potato. It was executed in 1589 by or for PHILIPPE DE SIVRY, who in the previous year had sent two tubers and a fruit from Vienna to CLUSIUS (CHARLES DE L'ESCLUSE). The original drawing if still preserved in the Musée Plantin at Antwerp. JOHN GERARDE (1596) was the first to cultivate the plant in England, and the frontispiece to his *Herbal* (1597) shows the botanist with a flowering spray of the Potato in his hand. It was from DRAKE that GERARDE received the tubers, which were cultivated at that time in Virginia. GERARDE, in his turn, communicated the tubers to CLUSIUS.

M. ROZE goes into detail respecting the early history of the tuber, and the countries from which it originated—details into which we need not follow him, as the subject was pretty fully dealt with in our columns at the time of the most instructive Potato Conference held at the Aquarium in 1886, and on the occasion of Mr. ARTHUR SUTTON's lecture, November 2, 1895, at the Royal Horticultural Society, as well as in the writings of Mr. J. G. BAKER, M. ED. ANDRÉ, M. ALPHONSE DE CANDOLLE, and others. Nevertheless, the details given by M. ROZE relating to the connection which CLUSIUS of Arras had with the introduction and dispersion of the Potato, are full of interest for those concerned in historical research. The general result is, that the native country of the Potato is pronounced to be Chile, and that as to the identification of particular species of tuber-bearing *Solanums*, there is the usual difference of opinion among botanists—a difference which the variation in the plants themselves amply justifies.

The dissemination of the Potato throughout France and the continent of Europe is largely treated by M. ROZE, but has naturally less interest for us than the corresponding details relating to its introduction into this country in the days of the Virgin Queen, when SHAKSPEARE was producing his immortal dramas.

How vast have been the changes in the Potato since that time is shown by the catalogue of MM. VILMORIN, in which six hundred and thirty varieties are enumerated. Our growers have lately naturally turned their attention towards the production of varieties with greater power of resistance to the onslaught of disease. To effect this, selection has been made of early varieties to ripen before the usual period when the disease may be expected, and efforts have been made by cross-breeding to secure greater robustness of constitution.

In dealing with the diseases of the Potato, M. ROZE lays great stress on the occurrence of a slime-fungus (*Pseudoommiss vitis*). In the disease known as curl, M. ROZE could find neither fungus-spawn nor bacteria, nor micrococci. What he did find was the existence of reddish-brown patches, similar to what had been observed in Beet, and which also occur in the Vine, being the cause of that once mysterious disease, "browning," which attracted so much attention at Chiswick and in the vineries of Mr. BLACKMORE. These patches are caused by the presence of a parasite which exists either in the form of a slimy or mucous "plasmodium," not enclosed in any cell-wall, and which feeds on the tissues of the leaf, or in that of large cells or cysts, as when the plant enters into a state of comparative inaction.

SUPPLEMENT TO "THE GARDENERS' CHRONICLE," DECEMBER 24, 1898.

HYDRANGEA HORTENSIS IN THE AZORES.

This parasite is by no means peculiar to the Potato or the Vine, but has already been recognised in some seventy or eighty other plants. M. ROZE has succeeded in cultivating the Pseudo-commis, and entertains no doubt that it is the cause of the disease in Potatoes known as curl. It should be stated, however, that some vegetable pathologists have not hitherto been able to agree with M. ROZE's conclusions.

The disease called scab is attributed by M. ROZE to a micrococcus, whilst dry gangrene is said by him to be due to a fungus, *Fusicyrtium solani*, and wet gangrene to the presence of a bacillus or micrococcus. The Potato disease proper, due to a fungus, *Phytophthora infestans*, is, of course, treated at considerable length, and credit is given to CHARLES MORREN for his discovery, in 1845, of the source of the mischief. It is curious to find that MORREN recommended an admixture of lime and copper-sulphate to be applied to the surface of the soil for the purpose of killing the fungus-spores, thus anticipating the now famous Bordeaux Mixture. We cannot follow M. ROZE in the ample historical details that he gives, nor discuss the share that particular botanists have had in the elucidation of the history of the parasite from MONTAGNE and BERKELEY to DE BARY. Those who desire to gain in small compass an account of the nature and development of the fungus, and of the controversies to which it gave rise, may be counselled to peruse M. ROZE's impartial summary. The sixth chapter is devoted to the cultivation of the Potato, including the subjects of hybridisation and grafting, and is marked by the same thoroughness that characterises the other chapters.

The space at our disposal forbids us from mentioning at further length the contents of this very valuable treatise. It is full of information, clearly arranged, and due credit is given to the various naturalists, of whose observations the author has availed himself. Considering the voluminous nature of the literature on the subject, we can but congratulate M. ROZE on the skill he has exercised in seizing what is essential, and in leaving aside that which is now seen to be unimportant or incorrect. Misprints are rare. HENSLEY should, however, be HEMSLEY; and CRUKSHANKS should be substituted for CRUCKSHANDS.

*** * OUR ALMANAC.**—According to our usual practice we shall shortly issue a *Gardeners' Chronicle Almanac* for the Year 1899. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and allied Societies, or any of our correspondents, will send us immediate intimation of all fixtures for the coming year.

HYDRANGEAS IN THE AZORES.—In our issue for Nov. 5 last, we reproduced a photograph, kindly furnished us by Dr. MORRIS, which gave an extensive view of some of the magnificent hedges of *Hydrangea Hortensia* that grow in the Azores. The Supplementary Illustration to our present issue will give a better idea of the wonderful height to which the plant grows, and illustrate the free-flowering habit the species appears to possess in any country. The photograph was taken towards the end of July by a member of the family DABNEY, which has represented the United States as consul for the Azores for three generations. The district where these particular hedges may be seen is the high pasture land of Fayal. As the *Hydrangea* was introduced to the Azores only some thirty years ago, the effect it has had upon the landscape, as shown by the photographs, is certainly remarkable.

"THE GARDENERS' MAGAZINE."—The Christmas number contains an almanac with a coloured

border of Penzance Briars, and a series of seasonable articles, which are fresh and bright, though dealing with worn subjects. We tender our congratulations to our contemporary.

MEETING OF BELGIAN HORTICULTURISTS AT GHENT.—At the meeting on Dec. 5 of the *Chambre Syndicale des Horticulteurs Belges*, the following awards were made:—Certificates of Merit for *Dieffenbachia Leonia*, for *Maranta major*, and for *Peperomia metallica* to M. Rigouts; for *Odontoglossum crispum* var. *Paulina*, to M. G. Vincke-Dujardin (*à l'unanimité*); for *Cattleya St. Legeriana* (*C. intermedia* × *C. Walkeriana*), to M. Vincke-Dujardin; for *Cattleya labiata* Madame G. Vincke (*par acclamation et avec félicitations du jury*); also for *Azalea Madame V. Vermeersch*, to MM. Vermeersch & De Baerdemaeker; for *Anthurium Andreanum* (hybrid), to M. C. Petrick; for *Poinsettia pulcherrima variegata*, to M. L. De Smet-Duvivier; and for *Lomaria* (*L. gibba* × *Blechnum brasiliense*), (*à l'unanimité*), to the same exhibitor. Cultural Certificates were awarded to M. A. Rigouts, for *Croton Madame De Smet-Duvivier*, for *Anæctochilus petola*, and for *Croton George Lesueur*. Honourable Mention was allotted to MM. Vermeersch & De Baerdemaeker, for seedling *Dracæna*; and Honourable Mention for Cultivation to M. Alloncius, for a collection of *Cocos Weddelliana*. The jury expressed the hope of seeing, at a later meeting, *Oreopanax Sanderianum*, shown by M. A. Rigouts, and *Kentia Dumoniana* from MM. E. Praet et Cie.

CARROTS IN INDIA.—We are sorry to learn that the efforts made at the time of the recent famine to cultivate Carrots on a large scale in India have not proved successful. We recorded at the time the success achieved by Messrs. CARTER & Co. in the prompt collection and despatch of an enormous quantity of the seed; but the results were unsatisfactory. It was not sown till 2½ months after the usual time for sowing, and the cultivation of imported seed, says *Indian Gardening*, is more suitable for the minute skill of the market-gardening classes than for the broader style of work displayed by the ordinary cultivator.

COS LETTUCES.—It is not generally known that *laitues romaines*, or Cos Lettuces, were introduced into France by RABELAIS. We do not find any statement of the kind in VILMORIN'S *Plantes Potagères*, but it is made by M. GIBAUT in a paper in a recent number of the *Journal de la Société Nationale d'Horticulture*.

THE LATE DR. PATERSON'S LIBRARY.—On the 14th inst., the Medals, &c., and the library of the late Dr. PATERSON, Bridge of Allan, were disposed of in DOWELL'S Sale Rooms, Edinburgh. These formed the last portion of the effects belonging to the estate of the late Doctor, the antique furniture, curios, &c., having been sold at previous sales, at which the largest prices were realised for ancient firelocks, which ranged in prices from about £20 to £80. The books on gardening were fewer in number than one would have expected, and of these not a few were presentation copies. The *Orchid Album*, vols. i. to v., brought the largest price of any, a dealer purchasing it for £9. Sharpe's *Monograph of the Alcedinidae* was £5; Bauer's *Genera Filicum*, 25s., and other works under £1. The curious old Atlas the Doctor was so fond of exhibiting to the numerous visitors who went to see the famous Orchids at Fernfield, was sold for £3 10s. The oldest work on gardening in the collection was the second (1721) edition of Reid's *Scots Gardner*.

MESSRS. HURST AND SON'S ANNUAL DINNER.—The annual dinner of Messrs. Hurst's employees took place at the Holborn Restaurant on the 17th instant, the spacious Venetian Hall being filled by the numerous company, including several visitors, among them Messrs. T. McKenzie, a member of the House of Representatives of New Zealand, W. G. Innes, G. Townsend, and others. Mr. N. SHERWOOD, V.M.H., presided, supported by his sons, Messrs. W. and E. SHERWOOD, and with few exceptions the

whole of the staff were present. The cordiality existing between the employer and employed was manifested in an unmistakable manner during the evening, especially when Mr. Sherwood in sympathetic terms proposed the health of the representatives, heads of departments, and general staff; but the enthusiasm was greatest when Mr. Hugh Aiton, one of the principal representatives, proposed the health of Messrs. W. & E. Sherwood. After the loyal toasts had been given, Mr. Mackenzie proposed "Success to the firm of Hurst & Son, and said that though there had been a falling off in the export trade of this country, this could not be said of the seed trade, and especially of the firm under whose invitation they had met that evening. He thought success had resulted largely from the personality of the firm, and the able staff by whom Mr. Sherwood was supported. Mr. Sherwood met with a perfect ovation. He said that he had learned this fact in business, that success depended upon the confidence reposed in the firm, and without such confidence they could not hope to succeed. He was justified in saying that their export trade in seeds had shown a decided increase. He had such confidence in his employees and their devotion to his interests, that he hoped all, from the highest to the lowest, would remain in his service. Later in the evening, when proposing what he termed the toast of the evening, "The Representatives and Staff," the Chairman warmly thanked all, from the youngest to the oldest, for their assistance in carrying on the work of the establishment. One present that night had been in the employ of the firm for thirty-four years, another for thirty years, and several between twenty and thirty years. He was looking forward with great hopefulness to his two sons, who were now taking part in the business as assistants in the work devolving upon the head of the firm.

TURNFORD HALL NURSERIES WORKMEN'S INSTITUTE.—The annual supper of the members and friends of the Workmen's Institute in connection with the Turnford Hall Nurseries took place on December 17. The proprietor, Mr. TH. ROCHFORD, occupied the chair, and was well supported by a number of honorary members and friends representing many of the business houses with whom the firm have dealings. The large dining-hall was beautifully decorated with Palms, Pandanus, Codæums, Begonias, and Orchids. Some 180 members and friends sat down to a capital repast. A miscellaneous concert followed, and was much enjoyed. At the close of the concert, the health of the proprietor was drank with ringing cheers, and in his reply Mr. ROCHFORD expressed the pleasure he had experienced in presiding on the occasion, and the enjoyment he had in meeting under such favourable circumstances so many of his workmen and friends. The Institute in which the company were assembled had been erected by him for the moral and material welfare of the men employed by him, and he was much gratified in the manner the young men appreciated the advantages placed within their reach. He hoped he might for many years enjoy the pleasure of meeting his friends on such occasions. Mr. G. PAUL replied to the toast of "The Visitors," expressing the pleasure he had in accepting the invitation to be present, and also bore testimony to the many advantages the Institute offered to the young men of the district. The young men themselves constitute the various catering, entertainment, and management committees and there is general satisfaction.

BARON FERDINAND DE ROTHSCHILD.

THE notice of the death of this gentleman will be received with as much regret by the horticultural community as by any other. The Baron's tastes were varied and refined. His garden and its contents afforded him the keenest pleasure, and being a Rothschild, it is needless to say that he was a strong supporter of our charities. "It was not right," he said, at the dinner of the Gardeners' Benevolent in 1897,

"that those who derived gratification from their gardens should forget the gardeners, to whom they owed so much."

The formation of his famous garden at Waddesdon was described in our columns on June 27, 1885, and July 18, 1889. Well-chosen, indeed, is the eminence on which Waddesdon Manor stands, and doubtless for centuries before it was placed there many a wealthy man had cast longing eyes on it for the site of a residence; but the necessity of scarping the crown to form a sufficiently large level surface, and the labour and cost of taking up the materials deterred them. These difficulties had not the slightest weight with the late Baron Ferdinand de Rothschild, whose artistic eye could see in the beauties of the surrounding valleys, and in the adaptability of the hill itself to artistic gardening, a more than equivalent benefit for the cost and labour incurred.

Consequently, the present princely mansion, a fitting casket for the priceless art-treasures contained therein, was built, and on its completion the country was searched for large Oaks which, at great cost, were taken up and planted to form an avenue running from the central hall to the immense white marble fountain on the other side of the plateau. The hill-side was cleverly laid out, its winding walks disclosing separate gardens, each one giving quite a new view of the surrounding country. In quiet nooks cool rockeries were arranged, and in planting trees and shrubs the late Baron always arranged that each of the main subjects should be planted in clumps of sufficient size to show their individual characteristics, and studiously avoided mixed planting, a proceeding which he rightly held gave a garden a monotonous appearance from end to end.

The fine block of plant-houses, with their central rockeries and rock-bordered corridors, contains a fine set of Orchid-houses, for the Baron cultivated the showier rare and handsome Orchids for two principal reasons—first, because he really liked them; and, secondly, because their flowers were of inestimable value in making those gorgeous displays in the mansion when entertaining, as he often did, the highest personages in the land. Cattleyas, Lælias, Odontoglossums, and such-like things, were grown in quantity, and of each kind only the best varieties were purchased. *Miltonia vexillaria* was also a favourite, and with it, on the occasion of a visit from her Majesty the Queen, Mr. Jaques, the gardener at Waddesdon, made, at the Baron's suggestion, what most of the guests present considered the finest and most chaste indoor decoration they had ever seen. In the matter of these decorations as with all things coming under the eye of the Baron, it was required that everything must harmonise, and if anything struck him as being incongruous it had to be removed.

That he loved his garden, and that he acquired rare and handsome plants because he loved them, and not merely because his wealth gave him opportunities for getting things which less fortunate beings could not afford, was evident; and the interest which he took in the plants shown at the Royal Horticultural Society, and at other exhibitions (for he invariably looked in at a flower-show wherever he might be), and the appropriate remarks which he always made about the subjects on view, clearly demonstrated the fact that not only did he like plants, but that he had acquired a considerable knowledge of them—a trait which is characteristic of all the Rothschilds.

ROUND THE MARKET.

COVENT Garden, with its modern extensions, where at this season all the various home-grown and exotic fruits and vegetables can be obtained, is now, as always, worthy of an inspection by the visitor to the metropolis. In no other market in the world are such immense masses of produce dealt with, and considering its rather restricted area, and congested street traffic, with so little confusion and delay. The early morning is the best part of the day, that is, in winter, from 4 A.M. till 6 A.M., to visit the market, so as to form an idea of the magnitude of the business done. Excellent Asparagus has been obtainable in

the market at any time these last six weeks, and delectable Seakale is fairly abundant and cheap. Saladings from France now take the lead, that of English growth being nowhere in comparison, either in quantity or quality. Those consumers of roast beef who like the warm pungent aroma of English Horseradish, must insist on getting it, there being much continental stuff on sale, which is sadly deficient in this respect, although of good usable size. Celeriac is the continental substitute for blanched Celery, which is fairly abundant just now. The buyer should be careful to eschew the tempting very big tubers, these being mostly hollow, and consequently wasteful in preparation for the table. Mushrooms are good and plentiful, and greenstuff of all kinds abundant and well flavoured, considering the drought the plants endured in September and October, which is not conducive to mildness of flavour. Cauliflowers and Early Broccoli were never finer at so late a date.

The flower market is very pleasing, and it is one of the sights of London, but few visitors see its beauties, owing to the market authorities closing it at 9 A.M. This market is at all seasons well supplied with flowers, and plants in great variety, some being very choice, so that a visit paid between five and six o'clock in the morning would astonish anyone unacquainted with the great proportions of this trade.

In the market proper can be seen on sale all the varieties of seasonable fruits, of fine production, many from far distant countries, including the bright coloured fruits of the Persimmon, or Kaki, a native of Japan, and now grown in the south of France. In form, a Persimmon fruit is like a good-sized smooth Tomato, but more spherical, with just a tiny point at the top. It has a thin skin, and is all pulp, and when thoroughly ripe or bletted, has an agreeable fruity flavour. Whether it will come in large quantities and become popular time alone will show. Lychees from China, a small brown nut-like fruit; Custard-Apple from Madeira; from the Canary Islands, Chow Chows, Yams, Mangos, Oranges, Tomatos, Bananas, and new Potatoes. Of Grapes, first there are those of home-growth, well to the front, consisting of Black Alicante, Grös Colman, and Muscat of Alexandria, some of the black Grapes having fine large berries. There are also Belgian and Channel Islands black Grapes, and that well-known good old kind, the Almeira, from Spain and Portugal. St. Michael Pine-apples are fine in appearance, and weigh from 4 to 6 lb. California sends us fine Apples, such as New Town Pippins, Baldwins, Blenheim Orange, &c. These American Apples are wrapped separately in paper, and packed in layers in boxes holding about 40 lb. Of Pears, there are Easter Beurré, Glout Morceau, Magnifique, and Barrys, which are likewise wrapped separately in paper, and packed in layers, some in one layer only. The Californians also send us Oranges, of which they have several varieties, such as Jaffa, Jamaica, Lisbon, St. Michael, Teneriffe, Tangerines, &c. From Canada there are at the present date Apples, Baldwins, Ben Davis, Greenings, &c.; and from Nova Scotia, King of Tomkins County, a showy-looking fruit; Ribston Pippins, Greenings, &c. These Apples are, without exception, packed in barrels holding three bushels. Nuts are in great variety, with Dates, dried Figs, and other fruits, and all the vegetables forced and otherwise in season.

Holly and Mistletoe, both well berried, with Christmas trees and other plants for decoration, are in great plenty.

CHRYSANTHEMUMS.

THE SEASON'S NOVELTIES.—Continuing my notes on the new Japanese varieties, commenced on p. 425, I find that the novelties in this section are more numerous than for some years.

Haawell Glory is one of Mr. Seward's English-raised seedlings, and belongs to the Japanese incurved section. It has pointed petals, and the flower is full and deep. The colours, chestnut and gold, are pleasing.

R. Hooper Pearson has been properly described as

a yellow-flowered Mutual Friend. It closely resembles that variety in everything but colour, which, in the novelty, is rich orange-yellow. As a market variety, this Japanese should be useful, as it blooms so freely. I regard this as one of the best of the year, and a credit to the raiser, Mr. H. J. Jones.

L. Humphrey is another of Mr. Jones' seedlings. The petals are of medium width, and the colour is pale red or terra-cotta.

Dr. Hope is a warm brick-red colour, with gold reverse. The florets are a trifle too erect and stiff to be graceful. It, however, promises to make a full, solid bloom.

Fair Maid is lilac-rose, with silvery reverse, which is plainly seen, as the centre petals incurve at the tips—a promising variety.

Lord Aldenham is a golden sport from Edwin Molyneux, naturally retaining the character of that popular variety. Whether it is good enough to maintain a leading position among yellows, which are so numerous, remains to be seen.

Fred Joy, one of Seward's seedlings, has rather stiff, broad petals. The colour is warm terra-cotta, with golden reverse.

Mrs. Seward is much like M. Chenon de Leché in form of flower and petal. The colour is rich red or crimson, with golden-chestnut reverse.

James Dare and Helen Seward are both from the same raiser (Seward); the former is magenta-claret, with stiff petals, and the latter red suffused with purple.

M. Fatzer is one of the most promising in M. Calvat's latest batch; the loosely incurving blooms measure fully 8 inches in diameter. The colour is rich yellow.

Mr. T. Carrington promises to become one of the best of the incurved Japanese section. The blooms are large, shapely, and devoid of coarseness. The inside of the florets are purple, the reverse silver, but of a darker shade than Australia, which it somewhat resembles. It is a distinct advance on that variety (Mr. W. Wells).

Nina Dabbs has full, broad, lance-shaped, yellow-coloured florets, which curl slightly at the tip.

Secrétaire Fierens has long drooping florets, bronze-red.

Swanley Giant produces large, closely-incurving blooms, lilac, pink, and white (Messrs. Cannell & Sons).

Master Jas. Epps has long drooping curly florets of deep yellow colour.

Surpassé Amiral is a large heavily-built bloom, just a trifle rough in the petal. The colour of centre is golden yellow, paler at the base, and occasionally flushed with red.

C. F. Payne is a good yellow-flowered variety, with broad florets.

Madame G. Bruant is a full-centred Japanese, with long flat florets, which curl slightly at the tips, until finely expanded. The colour is clear rose.

Souvenir de Madame F. Rosette is reddish-purple on the surface, with silver reverse.

Madeline Davis is one of Mr. Davis's seedlings, and is full of promise. The colour is white, lightly tinged pink. The florets are irregularly twisted. A full, deep variety.

Madame A. Rosseau is white, blotched with purple or lilac, full and large.

Mr. F. Brewer has petals of the style of Ella Curtis, pale yellow.

Le Grand Dragon, orange-yellow colour, with somewhat short petals.

Belle Mauve, a lovely tint of mauve, with incurving florets.

The following varieties have been raised by Mr. Weekes, Thrumpton Hall Gardens, Derby, and are distinctly creditable examples of English-raised Chrysanthemums:—

Mrs. Barkley has broad petals which curl at the tips; the colour is rose, with silver reverse.

Lady Crawshaw bears a close resemblance in the form of flower to Madame Carnot, but the florets are perhaps a trifle less in length. The colour is white, flushed faintly with blush. This variety should be noted by intending growers for exhibition.

W. Cursham belongs to the semi-incurving Japanese section with curled tips; the florets are narrow, bright, terra-cotta rose in colour, with gold reverse.

Annie Prevost resembles Etoile de Lyon in style of floret. It is rose-magenta in colour, tipped with silver.

Mrs. Coombes is one of Mr. N. Davis' seedling-raised varieties, with narrow, flat petals, the palest of lilac colour. *E. Molyneux*.

excellent decorative subjects; and next to them come the Pômpons. In both cases the blooms last for a long period in a fresh condition when removed from the plants.

In lifting the roots the stems should be cut off within 6 inches of the ground, and the roots dug up on a day when the soil is not unduly moist. Let the roots be placed in a cold vinery or a shed for a few days, and when dry let them be stored in a cool shed, cellar, or even under the stage of the greenhouse,

ment and loss of foliage. The first signs of aphid, black or green, should incite the gardener to take measures against these foes, either fumigating with tobacco, or vaporising with "XL all," never waiting till the plants are badly infested before acting. Fumigation on two successive nights will kill the aphides better than aught else. On the morning following a fumigation, the plants should be carefully syringed, in order to clear off the dead and sick insects and dust.

The Celery-leaf miner-fly (*Tephritis onopordinis*) is at times very destructive, disfiguring the leaves, and giving a check to the plants. The larvæ of this species of fly can easily be seen between the two skins of the leaf, and may be readily killed by nipping it, or in bad cases by the removal of the leaf.

The plants should now be standing in a house where they will be safe from injury by frost. A low span-roofed house, or a pit capable of being heated when necessary, suits them. The three chief points in winter-culture are freedom from frost, abundance of air, and a position close to the glass, so that growth will not become drawn, and fire-heat only made use of when absolutely necessary. In warm southerly localities the Cineraria is wintered in cold pits, and the little frost experienced is warded off by means of coverings. A cool, moist floor, upon which to place the pots is of importance. Those plants which have filled their pots with roots may be afforded weak manure-water occasionally, and plants in small pots for flowering at Christmas may be afforded half-a-tea-spoonful of sulphate of ammonia to each 6-inch pot, sprinkling it on the surface just before water is applied. Care must be taken when giving this stimulant that the soil is not dry, or injury to the surface-roots may be done. A safe method of applying sulphate of ammonia is to dissolve 2 oz. of it in 3 gallons of weak liquid-manure, and afford this alternately with clear water. Where cow's or sheep-dung can be obtained, nothing is better than this, and soot, mixed with water and applied in a clear state alternately with clear water. Plants intended to flower in March and April should be repotted, using a light, fibrous, loamy, rough (unsifted) compost, not made over-rich with manure. Except such plants as are growing in relatively small pots, Cinerarias do not require much water at the root at this season. Large specimens required for spring-flowering, if inclined to grow tall, and ill-furnished at the base, should have the point of the stem pinched out as a corrective. *E. M.*

A STORM-TOSSED VETERAN.

It may evoke some pleasant reminiscences at this season to lay before our readers a portrait of a *Pinus Cembra* (fig. 138) which has made a brave if futile effort to withstand the wintry blasts, the lightning flash, and the scores of other hostile contingencies which the trees on the slopes of the Alps have to contend against. The Matterhorn in the background forms a contrast striking but hardly real, for this great pyramid, which might be taken as an emblem of stability, is subject to the same fate, and the time will come when its rocky precipices will also present a picture of destruction and disintegration. The plasm of the tree and the rock of the mountain are both subject to continual change; and although we cannot conceive of their utter annihilation, yet the form they will ultimately assume must be something very different from what it now is. An account of the growth of *Pinus Cembra* in the forests of Zermatt was given in our columns, p. 236, September 24, 1898.

SCOTLAND.

FLOWERS IN SEASON.

FLOWERS are becoming year by year a more pressing requirement during Christmastide in Scotland; this is very largely because that festival is now more frequently observed than formerly. Churches and private chapels call for a large supply, and it is fortunate that we have Chrysanthemums to help in meeting these. White flowers are to be desired before all others

FIG. 138.—A STORM-TOSSED VETERAN.

FLORISTS' FLOWERS.

DAHLIAS.

In consequence of the mild weather experienced up to November 22, when several degrees of frost occurred in the south, and at Loughborough in Leicestershire, 12° were registered on the grass, Dahlias of all sections continued to bloom up to that time. Nothing would be gained, however, by allowing the roots to stay longer in the ground.

Dahlias of all types are now so numerous in variety, that none but the best should be grown, and the present is a good time to discard inferior varieties. The Cactus varieties are finding much favour, being

where water will not reach them. The chief points to be aimed at are freedom from injury by frost, and coolness without excessive dryness. The latter condition is best insured by covering them with sand, half-decayed leaves, or finely-sifted coal-ashes. As the spring comes round, and the roots exhibit signs of growth, a sharp look-out must be kept for the ravages of slugs and snails, which devour and gnaw the succulent growths.

CINERARIAS.

These will now require a good deal of the gardener's attention, or the heads of flowers will be poor. Green-fly is very troublesome, and particularly in mild weather, infesting the leaves, and causing disfigure-

but, fortunately, they are not indispensable; and for dimly-lighted edifices bright yellow flowers show better than any others. Mons. Pankoucke, Edith Tabor, Modestum, Noces d'Or, and Libby Allen, are among the best Christmas yellows we have. Niveum, Miss Margaret, Western King, and Souvenir de Petite Amie, are very good in whites. Of coloured varieties, in fine condition at this season, there may be mentioned Etoile de Lyon, J. B. Dibden, Silver King, and Souvenir de Madame Buller, the last-named a very fine and floriferous variety, of a dull crimson shade of colour.

A friend has written me recommending Mrs. Field as a late-flowering Mary Anderson, but for large churches, nothing at this season surpasses Chrysanthemums. I have used them repeatedly as pot-plants to embower the pulpit in an edifice it is my duty annually to decorate for Christmas. Large blooms are incomparably superior in their effect to small ones; and, as a rule, perhaps always, it is preferable to mass colours than to break them up in mixtures. For a small private chapel where only the finest flowers are admitted, Chrysanthemum niveum and S. de Petite Amie are the two best varieties, Arum Lilies, Roman Hyacinths, rose and white Van Tholl Tulips, and Calanthes with Palms, variegated Pandanus, Maiden-hair Ferns, &c., are the plants generally employed. For vase furnishing either Arum Lilies, Eucharis, or Chrysanthemums are used. Candle-brackets are lightly entwined with sprays of Ivy, with Holly intermixed. I know that there is a sentiment against Ivy. But as a matter of fact, previous to the Reformation, Holly and Ivy were the two sole members of the vegetable kingdom that furnished material for Christmas decoration in churches. In large buildings long sprays of Ivy can be used more effectively than any other material. Holly, when well-berried, is, of course, indispensable. I also use Box, which, however, is a plant that has been at no time in any great repute for the purpose. Rushes, not to strew on the floor, as in bygone days, but to use with Broom, Pampas-grass, browned Bracken-ponds, and any other suitable hardy material is of much value when used with discretion. Smilax is of the utmost value for screens of fine workmanship; but I think that on all permanent decorative work, only the slightest possible amount of material should be employed. It is the highest art in all kinds of floral decorations to know just when the correct quantity and quality has been reached, and there to stop. In nothing is this more apparent than in the floral decoration of churches.

With regard to house decorating, there is generally a stereotyped method which is repeated year after year in the same houses, and it is well not to attempt alterations where such is the case. Holly is, of course, the pre-eminant material, but the dark green leaves may be much lightened by the employment of the best variegated forms, such as Silver Queen and Golden Queen. For pictures, mirrors, and staircases the shoots are best when strung in single thickness on a string, but Ivy with small foliage is much better than Holly for these purposes.

For dressing the Christmas dinner-table, though we have not so far north the true Christmas Rose in flower till early in the year, yet *Helleborus latifolius* variety is a good substitute. Generally there is also a few blooms of the true *H. angustifolius*, which is very like *H. niger*. We have also *H. odoratus*, greenish-yellow, and this year *H. atropurpureus* has been flowering throughout the whole of the present month. A very pretty arrangement is consequently admissible with these flowers alone. But we have also Ivy in flower, and these are employed along with a very few sprays of the finest-berried Holly. Rosemary came into use about 1620, and sprays of this are used. B.

PROGRESS IN THE TOWN OF LEICESTER.

It is doubtful if there is any town in the United Kingdom which has progressed so rapidly [in some particulars. Ed.] as Leicester has done in the last

twenty years. Till then the principal streets were narrow, crooked, and badly paved, and without modern buildings of any pretensions, and much of the surrounding land was an unhealthy, swampy waste.

But in a comparatively few years this ancient borough has been revolutionised, not merely by being brought up to date as regards ordinary requirements, such as municipal buildings, post-office, hospitals, hotels, and one most convenient railway-station; but many of the streets have been widened, and properly planted with suitable trees.

The latest scheme is to bring an abundant supply of pure water from the hills of Derbyshire. Notwithstanding the great outlay incurred in improving the town in recent years, the health and the amusement of the inhabitants have received the greatest consideration. Convenient recreation-grounds have been laid out in various parts of the town; beautiful parks and pleasure-gardens have been planted with the most suitable trees and shrubs in great variety; special mention may be made of the fine collection of Hollies in Abbey Park, which are in luxurious health, in the midst of a busy part of this smoky town. There are other parks as extensive in the course of being laid out, and several miles of avenue are being carefully planted with trees. The entire management of the town-parks, gardens, and recreation grounds is entrusted to Mr. Burns. The unique method of bedding-out, and the attractive sub-tropical plants, have already been described in these pages, but it may not be amiss to mention the fine Bamboos and Mufas that were seemingly uninjured by the frosts and gales experienced at Leicester towards the end of November.

Notwithstanding the many demands on Mr. Burns personal attention, his energy and his determination to keep pace with the times, and make the places under his charge attractive the whole year, cause large quantities of plants to be cultivated. And of these Chrysanthemum plants fill three large span-houses. The flowers were in grand form at the end of last month, and might have been seen in a variety of forms, pyramids and standards bearing three or four flowers, big bushes unthinned of blooms, down to modest spring-struck plants growing in 5-inch pots bearing one fine flower. The varieties included the most modern of Japanese, and other sections.

The flowers on these plants were in many instances quite up to exhibition form, while the Pompon and single varieties were kept dwarf for placing near the walks. As showing how popular gardening is, and especially the cultivation of the Chrysanthemum, among the Leicesterians, it may be mentioned that the number of visitors on one Sunday numbered 12,000. J. H. Goodacre, Elvaston.

A MONSTROUS CARROT.

MALFORMED roots of all kinds are common enough among gardens, the aberrations from the normal shape being sometimes most grotesque. Thus we have Potatoes resembling the human hand, Beetroots forked like the human biped, and furnished with arms, and sometimes a caudal appendage. These monstrosities in roots are commonly due to the young root having met with hard, impervious impediments to its downward course, in consequence of which it has deviated in several directions, perhaps enclosing the impeding objects within its tissues. At other times, as in the case of several separate entities springing from one seed, as occurs sometimes in the seeds of Mangold Wurzel and Beet, there may be coalescence from the time of germination, the several individuals continuing united through life. The root shown in our fig. 139, was grown at Batheaston by Mr. Lennox, and exhibited at the Widcombe Horticultural Show this year. It was a transplanted Carrot, used in filling up a gap in a row.

HOME CORRESPONDENCE.

EXHIBITION COXCUMBS.—In a report of a flower show at Sandy, mention was made of some fine Coxcombs exhibited by Mr. T. Lockie, The Gardens,

Diddington Hall, Huntingdon, and an approximate estimate was hazarded as to their dimensions, but it fell short of their actual size, as they were subsequently measured, and it was found that the length of comb was 26 inches, and the breadth 16 inches; the four specimens were counterparts of each other, so finely and evenly had they been grown. Mr. Lockie states that the seeds which produced these remarkable plants had been saved from a very fine strain, and were sown at the end of February, and raised and grown on in a temperature of 70°, having the advantage of a mild bottom-heat. Mr. Lockie finds a Melon-frame the best to raise seeds in, and as soon as the plants are large enough to handle and are well-rooted, the best are potted singly and kept near the glass, and shifts are given as soon as the pots become filled with roots, the greatest care being taken not to allow them to become pot-bound, or starved for lack of attention; they are syringed every evening with tepid soft water, which is valuable for keeping away red-spider, which is very prone to attack the young plants. As soon as the combs begin to show themselves, those of a good shape and colour are selected, and transferred to the flowering-pots, usually those from 7 to 8 inches in diameter. When raising seedlings Mr. Lockie uses a very fine compost, but for advanced plants, and especially for those to be grown on as specimens, the compost is made up of good loam, some well-decomposed manure from a Mushroom-bed, leaf-soil, a good sprinkling of coarse sand, and some bone-meal; the drainage of the pots is bones broken to the size of a quarter of an inch. Treated as directed, the magnificent plants Mr. Lockie is accustomed to show are produced, and he has an excellent record as a prize-winner, for he is able to state that, having grown and exhibited Coxcombs in various counties for nearly thirty years, he has been beaten in competition only once. The strain which Mr. Lockie grows is one he has selected and cultivated for many years; in colour the combs were of a rich, glossy, wine-purple. It is the constant attention the plants receive which leads to such satisfactory results. Many who grow Coxcombs sadly neglect them, and it is want of attention which leads to so many failures. Somehow, the new colours in Coxcombs the German and other florists have produced, do not appear to be greatly appreciated in this country. Our growers still stand by either a rich ruby-crimson colour, or else the dark purple-crimson shade Mr. Lockie grows with so much success. Yellow, grey, white, and orange tints are not seen upon the exhibition-table. R. D. [The extra dwarfness of these plants is obtained by cutting off a portion of the tap-root at each successive potting, no strain of Coxcombs being naturally as dwarf as the best-grown plants; the wounded stump is placed in almost close contact with the cracks. Ed.]

CACTUS DAHLIAS.—Now that the season has closed a remarkably fine Dahlia time, the present moment is opportune for inviting attention to these flowers. There still remains in relation to them the old complaint, that the plants do not carry their flowers much above the foliage—an old-time fault with all Dahlias. More or less breeding and selection have in a certain degree corrected this, and it is to be hoped that the fault will be corrected in the case of the Cactus section. It is not enough that this section gives us fine blooms for cutting, we want also good garden decorative plants. Certainly there was no lack of varieties originally termed "Cactus," but now largely expunged by florists from the section that are effective plants in the border, but then they have not the true and much-prized Cactus form. Thus, whilst only the most perfect of flowers will satisfy their admirers, yet with many of these the habit of growth in the plant is not of the best. It has been a pleasing feature of the annual exhibition of the National Dahlia Society that a list of true or admitted Cactus varieties is published in the schedule, and as that of the passing year numbers forty-seven, it is obvious that selection was wide enough, as the classes for them do not, as a rule, call for more than twelve varieties. During the passing year about a dozen new varieties have been granted certificates, thus admitting them to the select list. It is naturally a matter of interest to learn what the executive will do in such a case, whether they will retain the entire list and adding the new ones, or delete from the year's list a certain number of inferior varieties, and by that means keep the Cactus list really select. I think that a selection of fifty varieties is enough for all purposes. Of course, were such a limitation of recognised Cactus varieties made by the society, it would practically compel all trade members of that

body to prune their lists accordingly, as it would be misleading for any member-trader to describe in his catalogue as Cactus varieties that were not recognised as such, and therefore not admissible to the shows of the National Dahlia Society. Florists should be grateful for such limitation of varieties, their lists being too extensive as it is. Still, these lists do not jar against common sense to so great an extent that the published lists of Chrysanthemums do. A. D.

TOXICOPLHŒA SPECTABILIS.—This handsome compact plant is now flowering here. Although somewhat out of its flowering season at present, it is a plant rather seldom seen in our gardens, and one that certainly deserves better respect generally. For its cultivation in pots the soil should be composed of about two parts loam, one part peat, and a good portion of sharp sand. Propagation is effected by layers and cuttings. P. Bolt.

THE OFFICIAL YEAR OF THE ROYAL HORTICULTURAL SOCIETY.—It is a noteworthy circumstance that there are to be two meetings of the Royal Horticultural Society during January. Hitherto there has been but one meeting. But there is to be, for some doubtless good reason, a second meeting in the ensuing month, therefore the year of the existing committee will not expire until the second meeting, which will, I presume, be on January 24. It is interesting that the Royal Horticultural Society should find it needful, in its operations, to extend the number of its meetings in this way; certainly they are not remarkable in mid-winter for extent, but generally they are extremely interesting and pleasing. It may be early to suggest that greater justice would be done to the very public-spirited and enterprising persons who send beautiful exhibits, no matter at what season of the year, to the Drill Hall, were the meetings more widely advertised in the daily papers, but something more should be done in that direction as the spring advances. It is surprising that, with so many thousands of Fellows, a greater number, especially of the new ones, do not attend. But there must be hundreds of flower lovers in London who would gladly pay a shilling to see the Drill Hall shows did they know of them. A. D.

LAPAGERIAS IN THE OPEN AIR.—I was interested in "R. B. L.'s" communication on this subject (p. 423), and if these plants can be well grown in the climate and environment of Dulwich, a new sphere of usefulness, and perhaps profit, may probably be in store for these beautiful plants over very much larger areas of country. While I have met with and heard of Lapagerias in very cool greenhouses, where the plants have been exposed to frost at all times, and in warm parts of the country, I do not remember seeing or hearing of it so near London before in the open air. Neither have I ever seen the white variety of the species in the open air. A general opinion prevails that *L. rosea-alba* is more delicate than the coloured species, and it must be admitted that it is not always so successfully grown; but it is doubtful how far the belief in the greater tenderness of mere white varieties of Lapagerias or other genera or species rests upon any solid basis of scientific fact. [It is merely a sport from *L. rosea*. Ed.] There would probably be found some special objections to the commercial culture of white Lapageria in the open air. The pollutions of the foggy climate of London must needs mar their spotless purity. Your remark, Mr. Editor, that the blooms from outdoors were of a deeper tint of crimson, was interesting. The same thing is noticed in Bougainvilleas, Tacsonias, and Passiflora, and many readers of the *Gardeners' Chronicle* would be glad to know the reason why. D. T. F. [We believe it to be due to the greater intensity of the lights. Ed.]

TIMELY PLANTING OF BULBS.—The Rev. Geo. Engleheart asks (p. 445) why I have "with very satisfactory results, transplanted Snowdrops and Narcissi in June, unless because that is the right season, and October or November the wrong one?" I merely referred to the satisfactory results attending the transplanting of the bulbs before the foliage had died down, by way of reminding your correspondent that success in bulb-culture out-of-doors is not dependent upon the bulbs being planted in September or October. The practice of transplantation in June is to be recommended when the bulbs can be transplanted from one part of the garden or grounds to another without delay; the bulbs will then complete the ripening of the foliage in their new positions. There is no doubt but Mr. Engleheart is quite right in planting out his bulbs as soon as they have ripened off their foliage, if not shortly before. Nevertheless,

the system cannot be carried out in general practice, owing to the fact of growers having to wait the arrival of supplies from the wholesale growers. I have always advocated in the *Gardeners' Chronicle* the early autumn transplantation of fruit trees, &c.; I mean the transplanting of trees from one part of the garden or orchard to another, so as to enable the trees to make fresh roots before they shed their leaves, and have thus been by no means unmindful of the good results attending the "timely planting" of all trees and plants, including, of course, bulbous plants. Mr. Engleheart's experiments in the planting of Narcissus Empress are interesting, the bulbs in this case having been lifted in June three years following. Your correspondent having reminded me "that it is the right practice of market growers which is under discussion," I will ask him, what would have been the result, in point of size, of bulbs A and B had they been left undisturbed in the ground for three years before being lifted? Does he think there would have been any difference in the size of the said bulbs if taken up two years after planting? Or, would there be any noticeable difference in the floriferousness, size and substance of flowers, and date of opening, the second year of flowering? My own opinion on these points is an emphatic No! Your able correspondent (whose contributions to the

FIG. 139.—A MONSTROUS CARROT. (SEE P. 460.)

Gardeners' Chronicle I always read with pleasure, and I hope, profit), will please remember that flower, farmers do not lift their bulbs annually. On the contrary, they leave them in the ground undisturbed for years, to increase in size and numbers annually. Mr. Engleheart says (truly enough) "Daffodil bulbs can be bought to any amount in January," and then asks, "Is January therefore the right time to plant them, or where does Mr. Ward draw the line?" January is certainly not the right time to plant bulbs, but had I taken a fresh house and grounds where there were no Daffodils in December, I certainly should not hesitate to make plantings in January, and I should expect (assuming the bulbs to be well preserved) to obtain as good, if not better, results fourteen or fifteen months later from these January-planted bulbs as from bulbs planted nine or ten months later. I beg to remind Mr. Engleheart that although my original letter was penned about the middle of the second week in October, I did not then say that this was the best time to plant bulbs, but that "the present is a good time to plant most kinds of bulbs." H. W. Ward, Rayleigh, Dec. 17.

THE LUCOMBE OAK.—I see you question the age of the Lucombe Oak here, which is given at 120 years in your special commissioner's report, p. 416. I

believe it is quite correct, as I repeatedly heard Sir T. D. Acland, the tenth baronet, say soon after I came here, that it had been planted eighty years. It is believed to have been planted by Mr. John Veitch, the founder of the present firm of Jas. Veitch & Sons, great grandfather to the present head, Mr. Harry Veitch. John Veitch was the Land Steward here at that time, and commenced as nurseryman on Budlake Farm, which adjoins the gardens here. The estate was very much improved by the planting done under his management, and I have often heard the late baronet speak in the highest terms of his taste and ability as a landscape gardener. Some of our largest Lucombe Oaks are grafted on the Turkey Oak, and throw out shoots below the union. Loudon gives 1735 as the date when the Turkey Oak was introduced into this country. John Garland, Killerton, Exeter.

AMPELOPSIS VEITCHI.—For many years I have been accustomed, when writing about this plant, to style it *A. tricuspidata*; now I see it called *Vitis inconstans*. Which is correct? If it is now a *Vitis*, why so? From information I got at Kew long ago, I had an impression that there was something about the glands of the climbers which separated *Vitis* from *Ampelopsis*. W. T. T. [If you prefer to keep *Ampelopsis* distinct from *Vitis*, then *A. tricuspidata*, Siebold, is the correct name. (See Masters, in *Gardeners' Chronicle*, 1869, p. 833.) If you think *Ampelopsis* not worth keeping separate from *Vitis*, then you must call the plant *Vitis inconstans*, as is done in the *Index Kewensis*. Lastly, if you think it most convenient to retain the provisional garden name, and continue to call it *Ampelopsis Veitchi*, there is nobody to gainsay you—*utrum horum mavis accipe*, Latin Grammar! Ed.]

HARDY HEATHS (p. 432).—Everything written by Mr. Bean is worth reading, and I have read his account of the hardy Heaths with much interest. But I should like to correct one statement he has made, which may deter many from growing the hardy Heaths. He says, "These Heaths will thrive in any good moist soil that is free from calcareous matter." My soil is full of lime and magnesia, but I grow most of those he mentions, and they thrive very well. Henry N. Ellacombe.

OLD BOOKS ON GARDENING.—I have read with much pleasure Mr. Brotherston's admirable account of that wise old writer on gardening, William Lawson. Another writer on the same subject, and of about the same period, or a little later, Ralph Austen, is also well worthy of notice and commendation. His small 4to, *A Treatise of Fruit Trees*, my copy of which (2nd edition) bears date 1657, is known to most collectors of books on gardening. But I have an 8vo volume by this author, *A Dialogue: or, Familiar Discourse and Conference between the Husbandman and Fruit Trees in his Nurseries, Orchards, and Gardens*, Oxford, 1676. I believe this book to be extremely scarce. The late Dr. Hogg, when looking at it in my library told me, that till that moment he had believed there was only one copy in existence, and that was in the Bodleian Library. Here are two brief extracts:—"An Invitation and Encouragement to a Conference with Fruit Trees. *Husbandman*: Come my Friends, let us walk into this pleasant Garden, and have some further Discourse with those innocent harmless companions, the Fruit Trees; they will bid us welcome and are still ready and at leisure to confer with us, and will be sure to teach us one good Lesson or another. But we must not forget what hath been often said concerning the way and manner of their Discourse with Men: That it is not audible to the outward sense of hearing, in the sound of words; but always to the inward sense, the mind, and understanding, and thus they will Discourse with us as long as we please, and they always speak Rationally and Religiously," &c. "*Husbandman*: It is undoubtedly true that cider, in general is the most wholesome drink, in reference both to health and Long life; though made of ordinary and common Fruits. But there are certain peculiar Fruits (now of late time) found out, and known, which makes cider far beyond (and better, than) the common Cider: As the Redstrake, the double Red-redstrake; gannet Moyles; and some other kinds that might be named: and so long as health and long life is in esteeme with men, so long will Cider be in esteeme also; as the chief meanes to attaine these Ends; Learned and judicious Physitians do also concur therein, and commend syrupum de Pomis; vinum Pomaceum; vinum

Britanicum, &c.; See London Dispensatory; composed by a College of Physicians pa; 38: &c." I wonder if any of your correspondents know of any other copy or copies of this book. Wm. Paul, Waltham Cross, Herts.

CHRYSANTHEMUMS IN SCOTLAND.—Mr. Molyneux obviously misinterprets my remarks. They did not refer to exhibition blooms, but to those for home use and for market, and the period embraced was that during which the blooms opened, and not to the whole season. There was undoubtedly a great stride forward evident in the training of those plants shown by Mr. Thomson at Edinburgh, but none in the quality of the individual flowers, which, in my judgment, were generally much inferior to those shown last year. I quite agree as to the high quality of the cut blooms. R. P. Brotherston.

PERSIMMONS.—I am told that these are now sold in the City as Cape-grown. I should like to know whether these Cape-grown fruits have seeds. Mine have none; but I know they produce seeds in the Riviera. Mine have been a great success this year. I have had plenty, many of them 9 in. round in the longest, and 7 in. by the shortest circumference. When thoroughly soft, the flavour is excellent, reminding one of the best Apricot-jam, with a suspicion of Nectarine, with both the flesh and skin of a rich, deep crimson colour. My tree is against a wall, but I have no doubt it would do well as a bush, and even without the fruit it would be worth growing for its handsome foliage. Henry N. Ellacombe. [The fruit we tasted had no seeds. Ed.]

TOMATOS IN COLLECTIONS OF VEGETABLES.—A little diversion is sometimes afforded when judges discuss the points of a collection of vegetables with Tomatos included in some cases and not in others. For my part, I do not approve of Tomatos being shown in a collection of vegetables, and I would like to see all schedules give good prizes for salads, which would include Tomatos, and at the same time state that the Tomato is exempted from collections of vegetables. There can be no doubt that the Tomato should be classed as a salad. I should like to see more prizes offered for salads—an interesting class. A. J. L., Wyfold Court.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

DECEMBER 13.—Present: Dr. M. T. Masters (in the chair); Mr. Veitch, Mr. Michael, Dr. Müller, Mr. Bennett-Poë, Mr. Sutton, Professor Church, Rev. W. Wilks, and Rev. Professor Henslow, Hon. Sec.; Visitor, Mr. Diderich, from Australia.

Prunus lusitanica var. *azorica*.—A spray with fruit of this variety of the Portugal Laurel was shown, having been sent by Miss Breton, Forest End, Sandhurst. Mr. Veitch observed that as a garden variety it had no special merits but rather the reverse, in consequence of its straggling habit.

Narcissus pachybotrys.—With reference to this species, Mr. Diderich remarked that it grows freely in Australia, though it is one rarely cultivated in this country. It is a native of Algeria.

Narcissus viridiflorus.—A flower of this rare species was sent by Mr. Kingswell, of Harrow Weald. It is an autumn-flowering species, rarely cultivated, but introduced from Spain or Barbary in 1629, according to Paxton.

Begonia venosa, Skam.—A new species from Brazil, with a remarkable habit and large leaves, densely tomentose below and furfuraceous, with substellate hairs above. The flowers are small, and of a pinky white tint. A botanical certificate was unanimously awarded to this very interesting species. It was received from Mr. Gilbert Christy, F.L.S. It had been raised from seed procured by Professor Löfgren on an island near Para.

Asparagus Sprengeri.—Introduced from the Cape about four years ago; it was exhibited by Mr. May. Two varieties, raised without crossing, have already appeared—viz., compactus and densissimus. It is an interesting species in that the "needle-like" structures of the garden Asparagus are in this species represented by genuine leaves, revealing the true nature of the former.

Caterpillars.—Some living specimens of three species were received from Miss L. H. Paterson (Edinburgh) and forwarded to Mr. McLachlan, who reports as follows:—"One of the caterpillars (brown) is the larva of one of the 'rove' beetles (Staphylinidae). They are mostly carnivorous, or feed upon decaying vegetable matter, so that they are generally beneficial. The other (a white one) is the larva of *Hepialus sylvinus*, one of the 'Swift moths.' The 'ghost moth' is of the same genus. It is destructive to the roots of anything herbaceous. The third was the larva of one of the Noctua moths, probably *Agrotis segetum*. It is very destructive, and feeds chiefly at night. It has nothing whatever to do

with the cockchafer, which it was thought to resemble. The above are all general feeders. It might be as well to lift the plants where they occur and supply fresh earth, charring the old. Insectivorous birds should be encouraged. A dressing of gas lime, repeated several times, might do good, but it should be used cautiously."

Apple-tree disease.—Mr. Bunyard sent a small branch curiously affected, with the following observations:—"The branch was sent to me by Rev. A. Foster-Melliard, in whose garden the tree grows. When the branch was cut it was in a pappy floccose state; this appearance had suddenly broken out in a tree grafted two years ago. It probably arose from strong unmanured wood being over-fed with stimulants. The tree had made a very gross growth." The specimen was forwarded to Dr. W. G. Smith for further examination.

THE HORTICULTURAL CLUB.

DECEMBER 13.—The usual monthly dinner and conversation took place at the rooms of the Club, Hotel Windsor, Victoria Street, S.W., on the above date, and there was a good attendance of members. Mr. Harry J. Veitch (Vice-Chairman of the Club) presided, and there were present the Rev. W. Wilks, Messrs. Martin R. Smith, Ph. Crowley, Selfe Leonard, James H. Veitch, Gosling, Salmond, Geo. Monro, Peter Kay, J. Tillman, Geo. Bunyard, Shoults, Bassett, and the Secretary.

The discussion was on size in flowers, fruits, and vegetables, and was opened by an interesting and amusing paper by the Rev. W. Wilks, who deprecated the vulgar taste for large things in the strongest terms. He alluded to the absurd size to which Chrysanthemums are grown, and asked, what lady would use them for the purpose of decoration? It was the same with fruits. The huge Gros Colman Grape had almost superseded all other kinds on the market. And so in vegetables; immense Onions were grown, from which nearly all true Onion flavour had been eliminated; and Brussels Sprouts, like young Cabbages, had superseded the small, delicate flavoured ones of former days. He hoped that there were signs of returning common sense and a clearer perception of beauty, and said that probably the worst offenders were provincial societies, with whom size was everything, and the man who could produce the biggest Cucumber, Vegetable-Marrow, or Onion, generally came off victorious.

Mr. MARTIN R. SMITH said that sometimes the size of *Souvenir de Malmaison* Carnations was adduced as a proof of this vulgarity, but the fact was that this race was entirely distinct from the ordinary type of Carnation, of which fact its foliage was a clear proof; its origin was unknown, but of its distinctness there could be no doubt. Mr. Geo. BUNYARD, as a fruit-grower, said the same thing held true with regard to fruits. Big Gooseberries, whose only recommendation was their size, had in many gardens superseded such fine flavoured varieties as Warrington, Ironmonger, White Champagne, Venus, Cheshire Lass, Yellow Golden Ball, and others, which had to give way to huge tasteless things. Mr. GEORGE MONRO stated that probably the British public was responsible for a good deal of this, and while big things sold well, he supposed the growers would cater for it. Many other members took part in the discussion, which was of a very interesting character, and a vote of thanks was cordially given to Mr. Wilks for his address.

ROYAL HORTICULTURAL OF ABERDEEN.

DECEMBER 14.—A special meeting of this society was held on the above date, to reconsider a resolution passed at the annual meeting.

That resolution was moved by Mr. Alex. Grigor, and was to the effect that working men members possessing greenhouses should not be allowed to compete at the shows of the society in the working-class division, but in those known as amateur's classes. From many reasons (one of the principal ones being that the entrance-fees in those classes would be higher), the working-class members much objected to the new rule. Their opposition met with such general support, that after considerable discussion, there voted thirty-five members in favour of rescinding the resolution, and but four against.

NATIONAL CARNATION AND PICOTEE.

DECEMBER 14: Annual Meeting.—There was a large attendance of members of this Society on the above date, and possibly never before were so many persons congregated in the room of the Horticultural Club as on this occasion. MARTIN R. SMITH, Esq., presided, but it appears to be the custom for the committee not to present a report, though somehow or the other one finds its way into the schedule of prizes when it is published.

The Secretary and Treasurer made a cheering financial statement, for the subscriptions had amounted to £249 1s., the Crystal Palace Company gave a donation of £50 to the prize fund, and the special prizes offered by the Chairman brought £10 7s. Prizes were awarded to the amount of £182 16s. 6d.; printing had come to £43 8s. 5d., and there were other expenses, and the committee are able to announce that their balance of £208 16s. 9d. at the beginning of the

year had gone up to £253 10s. 7d. Strange to say, not any of this surplus has yet been invested or placed on deposit at a bank. Advantage was taken of the presence of several of the leading growers and exhibitors to revise the schedule, and there were important modifications made in some classes and a liberal creation of new ones, especially in those known as amateurs. New classes could be created with a light heart, for with such a balance in hand, and with so generous a president, an increase was justifiable.

Mr. Smith announced his intention to withdraw his special prizes for border varieties, as he considers they have fulfilled the purpose for which they were originally intended but with that generous devotion to the Carnation so characteristic of the President, he announced his intention to offer Cups in other classes.

Mr. Douglas sought to confine the flowers shown as yellow-ground Picotees to those of the same character as the white-ground varieties—a reform greatly needed, especially as the judges appear to give the awards to yellow-grounds of questionable tint, and having more or less longitudinal flakes of colour. Mr. Douglas failed in his object, but his persistence may find its reward in the near future. The judges have been given a hint they will, no doubt, remember.

An enthusiastic vote of thanks was passed to Mr. Smith, as President, and he was unanimously re-elected to that post. The Vice-Presidents, officers, and committee were also re-elected, but few changes being made.

The Carnation and Picotee Society is now one of the most prosperous of the special floricultural societies, for the culture of the Carnation appears to be increasing by leaps and bounds. Wednesday, July 19, is the date provisionally fixed for the annual exhibition at the Crystal Palace in 1899.

THE NATIONAL AURICULA AND PRIMULA.

DECEMBER 14.—The annual meeting of the members of this Society followed close upon that of the Carnation Society, Mr. HARRY TURNER filling the chair.

This Society can be congratulated upon its progress during the past year; for though no report was forthcoming, there was an increase in the items of subscriptions and prize-money, and there appeared to be a determination on the part of the members to make the annual Auricula show an even greater success in the future. Two classes for the old florists' type of gold-laced Polyanthus were restored to the schedule, after being omitted for a few years, viz., for three plants and for one plant. It is well that a Society adding Primula to its title should have the genus fully represented at its exhibitions. The exhibition will be held in connection with the Royal Horticultural Society's meeting at the Drill Hall on April 18—too early, it is to be feared, for those who grow their plants in unheated structures; especially as after so mild and open an autumn and winter, there is reason to fear the spring may prove a retarding one.

Sir John T. D. Llewelyn, Bart., M.P., was re-elected President; Mr. T. E. Henwood, the Hon. Treasurer and Secretary; and there was but little change in the personnel of the committee.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

DECEMBER 15.—At the meeting of this Society, held at headquarters on the above date, there were present: Messrs. G. Sherrard Ball, in the chair; J. Leemann, Thomas Statter, H. Greenwood, W. Bolton, W. Holmes, R. Johnson, J. Cypher, and T. Mills (Hon. Sec.).

J. LEEMANN, Esq., Heaton Mersey (gr., Mr. Edge), showed *Laelia anceps* Leemannii (Award of Merit); *Lycaste Skinneri*, and *Odontoglossum crispum*.

G. SHERRARD BALL, Esq., Wilmslow (gr., Mr. Gibbons), showed *Cattleya Chocoensis* var. *Stella* (Award of Merit); *Cymbidium Winnianum* (Award of Merit); *Cypripedium insigne undulatum* (Award of Merit); *C. i. Sandere* (First-class Certificate); *Cypripedium Acteus* (Award of Merit); *Oncidium cheilophorum*, *Dendrobium glomeratum* (Award of Merit); also Silver-gilt Medal for group.

G. W. LAW-SCHOFIELD, Esq., of Rawtenstall (gr., Mr. Shill), showed *Laelia anceps alba* (Bull's variety), First-class Certificate.

THOMAS STATTER, Esq., Whitefield (gr., Mr. Johnson), showed *Cypripedium insigne Sandere* (First-class Certificate); *C. i. Ernesti* (Award of Merit); *C. i. splendens* (Award of Merit); *C. i. Leopoldinum*; *C. Areidne* (Award of Merit); *C. Leeana pendulum*; *C. L. superbum*; *C. Spicerianum* var. *magnifica*; *Laelia-Cattleya Tresideriana*. Also Silver-gilt Medal was awarded for the group.

WM. BOLTON, Esq., Warrington (gr., Mr. Cain), showed *Oncidium varicosum* var. *Rogersii* (First-class Certificate); *Cattleya labiata Boltonianum* (Award of Merit); and *Cypripedium insigne* (Bolton's var.).

HV. GREENWOOD, Esq., Haslingden (gr., Mr. Gill), showed *Cypripedium Antigone*.

O. O. WRIGLEY, Esq., Bury (gr., Mr. Rogers), showed *Cypripedium insigne Sandere* (First-class Certificate); *C. i. magnificum* (Award of Merit); *C. i. Ernesti*, *C. i. Youngianum*; *C. concolor*, *C. tonsum*, *C. callosum superbum* (Award of Merit); *C. Harrisianum superbum*, *C. Minosa* (Award of Merit), *C. Tityus*; *C. Leeana magnificum*, *C. L. superbum*; *C. seedling (villosum x oenanthum superbum)*; *C. Pitcherianum* (Award of Merit); *Dendrobium Findleyanum*. A Vote of Thanks was awarded for the group.

RICH. ASHWORTH, Esq., Newchurch (gr., Mr. Pidsley),

showed *Lælia anceps* Chamberlainiana (First-class Certificate), *Cypripedium* seedling, and *Odontoglossum asperum* albens.

CHAS. PARKER, Esq., Ashton-on-Ribble, showed *Cypripedium Parkerianum* (Boxall atratum x nitens superba) (First-class Certificate).

Mr. A. J. KEELING, Cottingly, showed *Cypripedium Lily*, *C. Norma*, *C. insigne Youngianum*, *C. insigne* (yellow form), *Cymbidium Tracyanum*, and a *Cypripedium* entered as *Fairianum*, but which the Committee declined to recognise under that name.

CHESTER PAXTON.

DECEMBER 17.—The annual general meeting of the Chester Paxton Society was held in the Grosvenor Museum, Chester, on the above date, under the Presidency of Mr. N. F. BARNES, head gardener at Eton Hall.

The Hon. Secretary (G. P. MILN) submitted his annual report, which showed a profit balance of over £33, which was carried over to next year. He also reported that the membership of the Society had increased considerably during the present year, and that the fruit and Chrysanthemum exhibition held in November last had been the largest and most profitable ever held under the auspices of the Society. A hearty vote of thanks was accorded to Mr. Barnes for having occupied the presidential chair for the past three years, and in reply Mr. Barnes stated the great pleasure it had always afforded him to be identified with the Society, and the good work it had done in the district in the way of promoting the culture of hardy British fruits. Mr. John Wynne, an enthusiastic horticulturist, and one of the oldest members of the Society, was elected President for the ensuing year, Mr. Barnes and Mr. J. Jackson being elected Vice-Presidents, and Messrs. J. D. Siddall, John Dutton, A. Ellans, S. Garner, Stephen May, W. Pringle, H. Rowe, Jos. Ryder, E. Stubbs, J. Taylor, R. Wakefield, T. Weaver, and J. Weaver members of the committee.

SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT.

DECEMBER 19.—The monthly meeting of the above Society was held at the Parish Room, Shirley, Southampton, on the above date. Mr. W. F. RUMMENS, C.C., presiding over a good attendance of the members.

The lecture was the second of two on "The Soil," given by Mr. E. T. MELLOR, B.Sc., London, Lecturer in Biology at the Hartley College, Southampton. The lecturer divided the subject as follows:—The relation of soil to plants, Chemical changes in the soil, Loss and replacement of nutritive substances in the soil; and each division was most effectively and profusely illustrated with lantern slides and chemical experiments of a most interesting and instructive character. Messrs. Spooner & Bailey, chemical manufacturers, Ealing, Southampton, gave the members an invitation to visit their establishment, where some interesting processes in the production of chemical manures would be shown them.

NATIONAL CHRYSANTHEMUM.

DECEMBER 19.—The Executive Committee met on the above date, Mr. P. WATERER in the chair. After the transaction of some preliminary business—

An important report was presented relating to the classification of a considerable number of new varieties, especially of the incurved type, and some additions were made to the lists of too-much-alike varieties. A recommendation from the Classification Committee was also adopted to the effect that a special circular be prepared and sent to all affiliated societies as soon as possible, giving so much of the reports of the Classification Committee as it may be expedient to publish; and also the lists of too-much-alike varieties, with an urgent request that they will print the same in their schedules of prizes, and make it binding upon their exhibitors. The necessity for the preparation and publication of a supplemental catalogue was urged, and the matter was referred to the Classification Committee to prepare the same. It was resolved that the Floral Committee meet on Wednesdays instead of Mondays as heretofore, the dates being Wednesdays, September 27; October 25, November 1, November 22, and on the show-days, viz., Tuesday, October 10; and Tuesday December 5. The meeting at the middle of November will be on Monday, the 13th; Wednesday, the 15th, being the date for so many of the leading exhibitions.

VARIORUM.

SEASONABLE ENTRÉES.

BRUSSELS SPROUTS AU GRATIN.—Carefully pick and boil in the usual way 2 lb. of prime firm Sprouts, then, when done enough, drain them well, but gently, so as not to break them. Have ready about a pint of rich thick white sauce, to which has been added the beaten yolks of two fresh eggs, four large tablespoonfuls of grated cheese, two tablespoonfuls of finely-chopped boiled Onion, and a liberal seasoning

of salt, pepper, and grated Nutmeg, then proceed as follows:—Put a few tablespoonfuls of the sauce on the dish, which ought to be a silver or fire-proof china one, and upon this arrange a close firm layer of the Sprouts; cover these with more sauce, and so on, until the ingredients are used up. The Sprouts should be piled up so as to form a neat dome-shape, and sauce should be added last of all. Smooth the surface over neatly with a wet, broad-bladed knife, sprinkle it with a mixture of grated cheese and fine bread-crumbs, and bake in a brisk oven for about twenty minutes. When thoroughly hot, and prettily coloured, garnish round the base with small daintily-fried rolls of prime bacon, and sippets of crisp, hot toast, and serve at once.

HARICOT BEANS À L'AMÉRICAINNE.—Soak a pint of small white Haricots over-night in cold water, then, next day, drain them, and put them into a stewpan with sufficient cold water to cover them; add two medium-sized whole Spanish Onions, two ounces of butter, a bunch of savoury herbs, and a seasoning of salt, then cover closely and cook gently until the Beans are quite soft, but unbroke, and the liquid has all been absorbed, after which remove the herbs and the Onions, and throw the former away, but chop the latter finely and return them to the Beans with a breakfastcupful of fresh Tomato-pulp, a tablespoonful of minced Parsley, the strained juice of a fresh Lemon, and a further seasoning of salt and pepper, then stir over a moderate fire until the whole is thoroughly hot. Serve piled up high in the centre of a hot dish, garnished round the base with minced cutlets, or croquettes, made of almost any kind of meat, or mixture of meat. Place a sprig of Parsley and a slice of fresh Lemon between the cutlets or croquettes, and serve as quickly and as hot as possible.

A FAVOURITE GERMAN DISH.—Take equal quantities of cold cooked Cabbage and Potatoes and pound them in separate bowls until quite smooth; then mix the vegetables together, add a seasoning of salt and pepper, moisten with a slice of fresh butter and the well-beaten yolks of two or three fresh eggs, and when all the ingredients are thoroughly blended, press the mixture into a well-buttered mould and bake in a moderate oven for about half-an-hour. When done enough, turn out the moulded vegetables on to a nice hot dish, garnish round about with a ring of skilfully fried small pork sausages, about 2½ inches in length, and serve the whole very hot.

A BIG LETTUCE.—There was on view at Messrs. C. Howie & Co.'s office, Market Street, a Lettuce grown by Mr. John Orr, Belgravia, which for size and shape would be hard to beat. It was produced from Webb's seeds, being of the variety Monstrous Cos, and measured about 18 inches in diameter.—*Reprint from "Diamond Fields Advertiser," October 24, 1898.*

Obituary.

MR. C. Y. MICHIE.—We regret to record the death of a prominent figure in connection with the management of the Salfeld estates, who passed away on Monday evening, the 19th inst., at his home, the Grand Entry, Cullen House. "For upwards of thirty years," relates the *Scotsman* of the 20th inst., "the name of Mr. Christopher Young Michie has been familiarly known in the North of Scotland as an authority on forestry, and an advocate of temperance principles. For the last year or so he has been suffering from an internal disease, which gradually undermined his constitution. Mr. Michie held a leading position as a forester, and had been familiar with forestry from the lowest step. He served his apprenticeship on the extensive, and well-managed estate of the Marquis of Lothian in Roxburghshire, whence he was appointed forester on the estate of the Earl of Delawarr, Buckhurst Park, Sussex. After remaining there a few years, he returned to Scotland, to take the charge of a district of the Earl of Salfeld's forest in Strathpey, where he remained

about six years. In 1866 he was promoted to be forester and ground-manager on the Cullen House estate, a position he has occupied for thirty-two years, and where he has carried out very extensive and important improvements on the estate, at first under Mr. W. G. Bryson, and since then under Mr. James Campbell, the present factor. Mr. Michie was a man of singularly varied abilities, combining the practical with the theoretical in an eminent degree. He had an interesting collection of objects of natural history, especially in connection with trees. These were publicly exhibited on several occasions. He showed great skill in constructing seats and other objects of rustic-work. Mr. Michie invented and patented an excellent and practical system of wire-fencing. Large quantities of this fencing have been used at home and exported to the colonies, being found specially serviceable on sheep farms. But Mr. Michie distinguished himself in a literary as well as in a mechanical capacity. He gained twenty of the Highland and Agricultural Society's prizes within as many years, the value thereof ranging from £5 to £20 each. He contributed largely to the Royal Scottish Arboricultural Society's *Transactions*, and gained at least a dozen medals. Mr. Michie was for many years the principal correspondent on forestry matters to several leading periodicals, and wrote at least 200 articles on practical forestry alone. His knowledge of the diseases of trees was specially full and accurate. *The Larch*, published by Messrs. Blackwood, is one of his ablest productions, and was very favourably reviewed. Another work by him, *The Practice of Forestry*, is regarded by many as the best book on practical forestry yet written. Mr. Michie's extensive experience was often called into requisition to report on forests in the North of Scotland, he having been employed by Her Majesty the Queen, the Earl of Aberdeen, and others. For Her Majesty he reported on the forest of Ballochbuie. His report on Lord Aberdeen's woods is an elaborate document, recently printed. Mr. Michie's relations with the tenantry, and all with whom he came in contact were of the most harmonious and agreeable character, his sound practical knowledge and good common-sense being universally recognised. A few years ago he received a handsome testimonial from the tenantry, contributed to most widely and spontaneously by all classes." Mr. Michie was a valued contributor of sound advice on forestry-management to the pages of this journal.

GARDENING APPOINTMENTS.

- Mr. THOS. H. USHER, late Gardener at Hoe Place, Woking, as Gardener and Steward to J. T. ROGERS, Esq., River Hill, Sevenoaks, Kent.
- Mr. F. WOODS, for the past three years Gardener to the Hon. H. SEWELL, Steephill Castle, Ventnor, Isle of Wight, as Gardener to C. MORTIMER, Esq., at the same place.
- Mr. PHILIP TAYLOR, of Letham Grange Gardens, Arbroath, as Head Gardener to AUBREY CARTWRIGHT, Esq., Edgescote Park, Banbury, Oxon.
- Mr. GEO. TAYLOR, Head Gardener at Broxmouth Park, Dunbar, desires us to correct a statement which we were led to insert in a recent issue, to the effect that Mr. JOHN G. WILSON had been appointed Gardener at that place, whereas he had been engaged by Mr. G. Taylor as Under-Gardener.
- Mr. JAMES SMITH, formerly General Foreman at Paddockhurst Gardens, Crawley, Sussex, as Head Gardener to Colonel WILKINSON, Elmhurst Hall, Lichfield, Staffs.
- Mr. H. MATHER, for over four years Foreman in the fruit-forcing department at Longford Hall, Manchester, as Head Gardener to W. GROSVENOR BEASLEY, Esq., Ryburn House, Rippenden, Yorkshire.
- Mr. J. C. TALLACH, for several years Head Gardener at Livermere Park, Bury St. Edmunds, as Head Gardener to E. MILLER MUNDY, Esq., Shipley Hall, Derby, Mr. ELPHINSTONE having been obliged to retire through illness.
- Mr. S. BRIGHTMAN, four and a half years as Foreman in the Gardens at Benacre Hall, Wrentham, Suffolk, as Gardener to A. TYRELL, Esq., Berkin Manor, Horton, Slough, Bucks.
- Mr. S. BURGESS, Gardener at Golders Hill, Hamstead, has succeeded Mr. H. MARKHAM as Head Gardener to J. FRIEND, Esq., Northdown, Margate.
- Mr. G. MOUNSDON, late Foreman, Radbourne Hall Gardens, as Head Gardener to B. H. BROOKSBANK, Esq., Sandrock, Fickhill, Rotherham.
- Mr. G. T. BRIGGS, late of Loudwater House and Ascott, as Head Gardener to JAMES BROGDEN, Esq., Iscoed, Ferry-side, R.S.O., Carmarthenshire.
- Mr. WM. STANBURY, as Head Gardener to W. A. W. MUSGRAVE, Esq., Thame Park, Oxfordshire.

Mr. F. C. WALTON, late Foreman in the Gardens, Bodorgan, Anglesea, as Gardener to ERNEST DE LA RUE, Esq., Lower Hare Park, Newmarket.

Mr. A. CHEESEMAN, for the past four years Gardener at Hazelwood, Horsted Keynes, as Head Gardener to M. P. EVANS, Esq., Cookhams, West Hoathly, Sussex.

Mr. JAMES FULTON, late Gardener at Glenstal Castle, Limerick, as Gardener to W. S. GILBERT, Esq., Grim's Dyke, Harrow Weald, Middlesex.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending December 17, is furnished from the Meteorological Office:—

"The weather was again extremely mild in all parts of the kingdom. Heavy rain was experienced in the north of Scotland, and frequent, but comparatively slight falls in the west and north generally; over central, eastern and southern England, the rain was very slight, and mostly in the form of drizzle.

"The temperature continued unusually high, ranging from 6° above the mean in 'Scotland, N.' and the 'Channel Islands,' to 8° in most other districts, and to 9° in 'England, N.E.' The highest of the maxima were recorded either on the 11th or 12th, when they varied from 18° in 'England, E. and N.E.,' the 'Midland Counties,' and 'Ireland, S.W.' to 55° in 'Scotland, W.,' 'Ireland, N.,' and 'England, S.W.' The lowest of the minima, which were registered during the middle part of the week, ranged from 30° over central, eastern, north-eastern, and south-western England, to 36° in 'Ireland, N.,' and to 44° in the 'Channel Islands.'

"The rainfall was much more than the mean in 'Scotland, N.,' but less in all other parts of the kingdom. In most of the English districts the fall was very slight.

"The bright sunshine just equalled the mean in the 'Midland Counties,' but was deficient in all other districts. The percentage of the possible duration ranged from 17 in 'England, E.,' to 7 in 'Scotland, E.,' 6 in the 'Channel Islands,' and to 3 in 'Scotland, N.'"

NOTICES TO CORRESPONDENTS.

BOUVARDIAS: C. R. T. We think that the injury to the flower resulted from fog. See reply to "T. W., Violets Damping," in our last issue.

CELERY SPONGY: J. P. The plants may have had a good deal of water at long intervals of time, but that was not enough last season, the drought being so severe. To have tender, crisp, solid stalks, the plants should be kept in a uniformly moist condition during the hot weather, and until moist autumn weather sets in, and even then occasional soakings are beneficial, for the bigger the crown of leaves the greater the need of root moisture, the whole soil and manure having become permeated with roots. Your later successions have been grown among Apple-trees and Nut-bushes which made the soil dryer than it would have been, and the shade from them, would not be favourable to stocky, firm growth. The stalks sent for inspection are not Major Clarke's Red, but some white variety. The leaf miner can only be kept in check by diligently hand-picking the worst leaves or parts of leaves, and nipping the grub within the tissues.

CURRENT-BUDS: Kentish. Affected by the Currant Bud-mite. Cut off and burn all affected shoots. There is no known remedy short of this.

GRUBS IN THE SOIL: S. L. C. The larvæ of a weevil, very destructive to the roots of plants, and found in great numbers in pasture-land. Loam from infested land should be stacked for at least twelve months before it is made use of, and the stack kept quite free of herbage, thus starving any of the weevils present in the soil. The grub cannot be killed by any substance applied to the soil in a flower-pot that will not also kill the plant.

HORTICULTURAL CLASSES: D. E. S. We cannot say.

HORTICULTURAL EXAMINATION: S. P. Yes, your books are well selected, but do not trust to books exclusively, or even mainly. Get as proficient as you can in your garden-work, and, as far as you can, consult your books with reference to each detail of your work, endeavouring to ascertain the reason why you do this or that; why this is good practice, and why that is not good.

HOVEA CELSI SEED: A. P. Try Messrs. Balchin and Sons, nurserymen, Hassocks Gate, Brighton; or Messrs. J. Veitch and Son, Royal Exotic Nursery, Chelsea, S.W.

HYBRID ORCHIDS: A. E. H. In the matter of the hybrid Orchid you name, the committee of the Royal Horticultural Society unanimously agreed that it was the same as the one previously shown, so far as they could judge by the flower staged. With secondary crosses it is impossible to say what may or may not take place in the progeny of apparently different crosses.—T. A. The temperature and treatment you propose for the Orchids named during the winter seems correct.

NAMES OF FRUITS: A. Dunbly. 2, Lane's Prince Albert; 3, Dutch Mignonne; 6, New Hawthornden; 7, Dumelow's Seedling; 4, Golden Noble; 5, Beauty of Kent; 3, probably Winter Strawberry.—J. F. Hicks. Golden Noble.—A. S. 4, New Hawthornden; 3, Braddick's Nonpareil;

others unknown, and of poor quality, probably local varieties.—J. H. S. 1, Dumelow's Seedling, a very fine specimen; 2, New Hawthornden.—W. H. Smith. 1, Annie Elizabeth; 2, Frogmore Prolific; 3, not known; 4, Alfriston.—South Bricks. Pears: 3, Ne Plus Meuris; 6, Vicar of Winkfield; other Pears over ripe; Apple: 4, New Hawthornden.—J. S. Apple: White Paradise.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—E. C. 1, Abies numidica?; 2, Picea sitchensis; 3, Abies balsamea; 4, Relinospora plumosa of gardens; 5, Retinospora lycopodioides of gardens; 6, Retinospora squarrosa of gardens.—J. A. T. The two varieties of Cypripedium insigne flowering out of an importation are of ordinary merit. The one with purple spots in the upper sepal is near to the old C. insigne Maulei; and the other is of the same section, though inferior to C. insigne Bohnhoffianum.—G. W. C. It is a form of Odontoglossum Andersonianum, and if it maintains the size and brightness of colour displayed in the bloom sent, a very fine variety of it.—W. Colvill, Bath. Your box was completely smashed in the post. The contents appear to have been a yellow Chrysanthemum flower. You had best send varieties of florist's flowers to some nurseryman who grows them largely, and furnish him with full particulars as to the habit of growth of the plant.—W. M. Buddleia auriculata; see Master's Gard. Chron., Nov. 9, 1889, p. 529.

ORCHIDS: Antwerp. The insect injuring your plant is the grub of Isosoma orchidearum, family Chalcididae. The plants should be isolated. (See Gardeners' Chronicle, vol. xix, 1896, p. 501.)

POTATOS AT DUBLIN SHOW: Subscriber. The copy of the Gardeners' Chronicle containing the account of the show in question can be obtained on application being made to the publisher. The price, together with postage, is 3½d.

PYRUS (CYDONIA) JAPONICA: Kentish. Propagation by means of layers, suckers, and green unripe cuttings. The fruits of P. Maulei mak, a nice preserve when mature. Although the type species is hardy in Britain, it requires a warm situation to ripen its fruits perfectly. The plant stands cutting, and bushes may be pruned like the Gooseberry, only leaving the lateral spurs longer. On these the blooms come.

SEED FOUND IN GARDEN: S. P. Some variety of Ricinus (Castor-oil) probably. Smashed in the post.

SKIMMIA: L. B. Skimmias are dioecious, i.e., the male and female flowers are on different plants, so that the one you send in bud is probably the male of S. Fortunei, while the berries are certainly those of that species, misnamed in gardens S. japonica.

SPINACH PLANTS INJURED BADLY: Kentish. The plants have been checked by a parasitic fungus—Peronospora effusa. Spraying with potassium sulphide solution would check the spread of the disease. Affected plants should be collected and burned; if allowed to rot on the ground, the disease would probably appear again next season if Spinach should be sown thereon.

WEED IN CULTIVATED LAND AT THE CAPE: D. Rye, introduced with European seeds, we suppose. It would form a good forage-crop.

COMMUNICATIONS RECEIVED.—Gillespie Brothers.—E. W. B. W. T.—G. H.—F. A. W. Ithaca.—Dr. R. Vienna.—J. Moir.—E. W. & Son.—W. B. Hemsley.—R. K.—F. A. W.—H. C.—H. T. M.—A. J. L.—J. O. B.—J. N.—H. M.—T. Turton.—B. F.—H. B.—W. J. C.—W. K.—J. W. McH.—W. H. Y.—A. G. C.—G. D.

SPECIMENS, PHOTOGRAPHS, &c., RECEIVED WITH THANKS.—A. O.

DIED.—On December 16, at Iddesleigh, Sevenoaks, ALICE MARY, the dearly-loved and deeply-lamented wife of HARRISON WEIR.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

(For Markets, see p. viii.)

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 31, 1898.

THE GREEN GAGE GROUP OF PLUMS.

THE many vicissitudes to which the common garden Plums have been subject in the course of several centuries of cultivation, and through their introduction to many different lands, have naturally developed various interesting modifications of the species. These modifications were so numerous and conspicuous that Linnæus divided his species *Prunus domestica* into fourteen botanical varieties. Most of the variety types which he accepted from Bauhin are still known to us in some form or other at the present day, though botanists and horticulturists seem largely to have lost sight of this classification which he made. I have recently made an effort to trace these groups as distinguished by Linnæus,* and I find that the one which has had the most interesting and eventful history, and the one which gives the best key, apparently, to the horticultural evolution of the whole species, is the Green Gage, or Reine Claude group. This is the one, doubtless, which Bauhin meant to characterise as *Pruna parva ex viridi flavescentia*, and which Linnæus named in the first edition of *Species Plantarum* with the trinomial *Prunus domestica* var. *cereola*.

What seems to have been this same type of Plum was mentioned by several of the pre-Linnean writers; but the first really satisfactory reference to it is in Bauhin's *Pinax*. From that time to this the Green Gage or Reine Claude Plums have played an important part in all horticultural literature, as the following chronological conspectus of the more important references will show.

BIBLIOGRAPHY.

1671. Bauhin, *Pinax*, 443, gives *Pruna parva ex viridi flavescentia*, which may perhaps be intended to describe this variety.
1700. Tournefort, *Institutiones Rei Herbariæ*, follows Bauhin, giving *Prunus fructu parvo, ex viridi flavescente*.
1729. Langley, *Pomona*, describes both Reine Claude and Green Gage in the evident belief that they are distinct varieties. Both are figured, though poorly, the former being considerably the larger. Of Reine Claude he says, "It is an excellent Plum, yellow next the sun when ripe, and cover'd with a Pearl colour'd Flew. The Pulp is yellowish within, very firm, comes from the stone, and is very full of an excellent sweet rich Juice, a good Bearer: Ripe, August 8."
1731. Stephen Switzer, in *The Practical Fruit Gardener*, 2nd ed. (London), describes Reine Claude and Green Gage separately, evidently quite unsuspecting of any synonymy.

1752. Miller, *Gardeners' Dictionary*, 6th ed., has "Prunus fructu rotundo e viridi flavescente, carne dura, suavissimo. La Grosse Reine Claude, Large Queen Claudia, by some Dauphiny. At Tours it is called Abricot verd; at Rouen La verte bonne; in other places Damas verd, or Tromp-valet. This is one of the best Plums in England."

1753. Linnæus, in the *Species Plantarum*, 1st ed., gives *Prunus domestica* var. *cereola* = *Pruna parva ex viridi flavescente*, Bauh.

1758. Knoop, in the *Pomologia* (Holland), recognises Reine Claude as a group, but does not refer to the name Green Gage.

1768. Duhamel, in the *Traité des Arbres Fruitières* (Paris), gives: "Prunus fructu magno, paululum compresso, viridi, notis cinereis, and rubris consperso." Dauphine, Grosse Reine Claude, Abricot verd, Verte-bonne; Duhamel gives a good uncoloured figure, says: "Cette Prune mûrit au mois d'Août. Elle est sans contredit la meilleure de toutes les Prunes pour être mangée crue."

1803. William Forsyth, in a treatise on the *Culture and Management of Fruit Trees in England*, so called American edition; edited by William Cobbett, and published in Albany, gives Large Queen Claudia, saying: "This is an excellent Plum, of a yellowish-green, and ripens about the beginning of October." He also gives Green Gage, saying: "It is of an exquisite taste, and eats like a sweetmeat; its colour and size sufficiently distinguish it from any other. It ripens in August and September." He adds: "There are several varieties of this Plum (Green Gage), and all good."

1812. Brookshaw, in his *Pomona Britannica*, recommends Green Gage, and gives a good figure, but does not mention Reine Claude.

1816. William Salisbury, among *Hints addressed to the Proprietors of Orchards*, gives Green Gage.

1823. Henry Phillips, in the *Pomarium Britannicum*, 3rd ed., London, says: "This latter Plum (Green Gage) was called the Reine Claude from having been introduced into France by Queen Claude, wife of Francis First of that country, but it bears various names in different parts of France. This Plum received the name of Green Gage from the following accident: The Gage family in the last century procured from the monastery of the Chartreuse at Paris a collection of fruit-trees. When these arrived at the mansion of Hengrave Hall the tickets were safely affixed to all of them, excepting only to the Reine Claude. . . . The gardener, therefore, being ignorant of the name, called it, when it first bore fruit, the Green Gage."

1825. De Candolle, in the *Prodromus*, vol. ii., p. 533, gives *Prunus domestica*, Linn., var. *Claudia*. Persoon Ench. 2, p. 35, refers to this variety both Grosse Reine Claude and Petite Reine Claude of Duhamel, and Reine Claude Violette of Loisel.

1825. G. Bliss, in the *The Fruit-Growers' Instructor*, London, speaking of Green Gage, says: "This Plum is too well known to require much being said of it." He does not mention Reine Claude.

1846. Poiteau, in the *Pomologie Française*, gives a coloured plate and description of Reine Claude, and says it is reproduced more or less truly from seed; but notes in another place that there are several varieties very different in quality.

1855. Loudon, in the *Encyclopædia of Plants*, gives Green Gage, and makes Reine Claude a synonym of that name.

1866. Mrs. William Bayle Bernard, in *Our Common Fruits*, London, uses the name Green Gage for a variety evidently well known.

1876. Koch, in the *Die Deutsche Obstgehölze*, Stuttgart, says "That Italy is certainly not the home of this variety." He quotes Bechstein as of

the opinion that it came from North Asia. Koch seems to share this opinion for the want of a better hypothesis:—"Sie haben so viel mit den echten Damascenen, andertheils mit den Zwetschen gemein, dass man der Meinung sein könnte, sie seien aus einer Kreuzung beider hervorgegangen."

1882. Lauche, in his *Deutsche Pomologie*, mentions a large Reine Claude, and several other Reine Claudes, and remarks that nothing is known of the origin of this very old and generally distributed sort. It probably came from Italy to France, and has been distributed from there.

1896. Bredsted, in the *Haandbog i dansk Pomologi*, cites Green Gage, referring to Lindley, Downing, Thomas, and Hogg, as authorities for the nomenclature. He alludes also to twelve varieties of Reine Claude besides synonyms.

The bibliography of this group in America is as follows:—

1823. William Prince, *A Short Treatise on Horticulture*. New York. In this work are enumerated several Gages, also Little Queen Claudia, and Large Queen Claudia, saying that the latter is "the parent of all the class of Gages."

1833. William Kenrick, *The New American Orchardist*. Boston. Describes Green Gage, and gives, in a considerable list of synonyms, "Great Queen Claude of the English."

1839. Edward Sayers, *The American Fruit Garden Companion*, 2nd ed. He describes the Green Gage, and several other Gages, without mentioning Reine Claude.

1845. Downing, *Fruits and Fruit Trees of America*, 1st ed., describes Green Gage, referring to Langley, Lindley and Thompson as authorities for the nomenclature. He adds a long list of synonyms, including Reine Claude.

1849. S. W. Cole, in *The American Fruit Book*, gives Green Gage, and recognises Reine Claude as a synonym.

1857. J. J. Thomas, in the *American Fruit Culturist*, gives Green Gage, with Reine Claude as a synonym, also Reine Claude de Bavay separately, together with other Gages.

1857. Thomas Gregg, in the *Handbook of Fruit Culture*, New York, gives as distinct varieties Green Gage, Reine Claude de Bavay, and Reine Reine Claude d'Octobre.

1857. E. J. Hooper, *Western Fruit Book*. In a list of Plums, mostly of European origin, this author gives Green Gage without comment, and without other varieties of this group.

1859. F. R. Elliot, *Western Fruit Book*, 4th ed., cites Green Gage (syn., Reine Claude) and Reine Claude de Bavay.

1872. Barry, *Fruit Garden*, mentions Green Gage and Reine Claude de Bavay separately.

HISTORICAL SUMMARY.

The Reine Claude or Green Gage group of Plums is of early origin. Its birthplace may have been southern Europe or eastern Asia. Various countries have been named in this connection with about equal uncertainty. It was introduced into France from Italy by Queen Claudia about 1500 (Francis I. of France lived 1494-1547). From here it was distributed through the remainder of Europe. It was frequently propagated from seeds, so that many diverse forms were early extant. The name Green Gage was given in England to a lot of Reine Claudes from which the name had been lost; but in other places Reine Claude continued to be in cultivation under its rightful name or under the even earlier name of Verdoch or Verdochia. Regarding this passage in the history of the variety, Hogg gives the following interesting notes:—

"The Green Gage is supposed to be a native of Greece, and to have been introduced at an early

* *Botanical Gazette*, December, 1898.

period into Italy, where it is called Verdochia. From Italy it passed into France during the reign of Francis I., and was named in honour of his consort Queen Claude; but it does not appear to have been much known or extensively cultivated for a considerable period subsequent to this, for neither Champier, Olivier de Serres, Vautier, nor any of the early French writers on husbandry and gardening seem to have been acquainted with it. Probably about the same time that it was introduced into France, or shortly afterwards, it found its way into England, where it became more rapidly known, and the name under which it was received was not the new appellation which it received in France, but its original Italian name of Verdochia, from which we may infer that it was brought direct from Italy. It is mentioned by Parkinson in 1629 under the name of Verdoch, and, from the way he speaks of it, seems to have been not at all new or even rare. It is also enumerated by Leonard Meager in the 'list of fruit which I had of my very loving friend, Captain Gurle, dwelling at the Great Nursery, between Spitalfields and Whitechapel,' and is there called Verdocha. Even so late as the middle of the last century, after it had been re-introduced and extensively grown under the name of Green Gage, it continued to bear its original title, and to be regarded as a distinct sort from the Green Gage. Hitt tries to describe the distinction, but as he also tries to show that Reine Claude is distinct from Green Gage his authority cannot be taken for more than it is worth; a remark which may safely be applied to all our pomologists of the last century. Miller also laboured under the same misapprehension as Hitt, for in his dictionary he says, speaking of the Grosse Reine Claude:—'This Plum is confounded by most people in England by the name of Green Gage.'

"We have seen, therefore, that the generally-received opinion that this valuable Plum was first introduced into England by the Gage family is incorrect, but that it must have existed for considerably upwards of a century, at least, before the period which is generally given as the date of its introduction."

The variety apparently came to this country first from England under the name of Green Gage. Since that time, however, numerous importations have been made from France in which the same tribe passed under the name of Reine Claude. For the most part the similarity or identity of Green Gage and Reine Claude has been recognised by the best pomologists of America, even from its first introduction.

At the present time there are two principal varieties of this type in the market. The first is distinctively the Green Gage, bearing small early Plums on a dwarfish tree. The second is Reine Claude de Bavay, a stronger grower, later in ripening, with larger fruit. This distinction, however, is not always understood, though probably a majority of the best nurserymen take this view. There are various other Green Gages, but they have mostly local names and reputations, and are not confounded with the two types mentioned above.

Still it is an open question what a man would get if he ordered Green Gage or Reine Claude from ten different nurserymen.

PRESENT STATUS.

Recent American nursery catalogues of the better class, list usually two varieties. The first of these is called Green Gage, though Reine Claude is frequently entered as a synonymous name. The second is called Reine Claude de Bavay, or simply Reine Claude. It is a later, larger, and better variety than the former. Besides these two there are dozens of varieties of the same group named and recognised, but grown only locally. I note that leading English nurserymen list both Green Gage and Reine Claude de Bavay, as, indeed, do the French nurserymen. In one French catalogue

which I recently examined, there were fifty varieties of this group listed, and about 150 synonyms given. This serves to show somewhat of the present importance of the group. *F. A. Waugh.*

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM INSIGNE, HAREFIELD HALL VARIETY.

THE general opinion of those who saw this gigantic and beautiful variety, when it was shown by Elijah Ashworth, Esq., Harefield Hall, Wilmslow, Cheshire (gr., Mr. Holbrook), before the Orchid Committee of the Royal Horticultural Society, December 13, 1898, on which occasion it was awarded a First-class Certificate, and its grower a Cultural Commendation, was that it was far ahead of any other variety of the species in point of size and form, and equal to the best in general beauty.

It will be well to record the carefully-taken measurements. The dorsal sepal is exactly 3 inches across at its widest, and $3\frac{1}{16}$ inches in height. The lower sepals are 2 inches wide, and nearly 3 inches long. The petals, which are flat and almost horizontally extended, measure 6 inches from tip to tip, by 1 inch in width. The lip is 2 inches wide at the upper angles of the side-lobes; and $2\frac{1}{2}$ inches in length. The staminode is very large, and of a bright-yellow. In colour the dorsal sepal is pale greenish-yellow, with large brownish-purple blotches on the lower half, the marginal half being pure white, with clusters of violet spots in the upper portion. The lower sepals are yellowish-cream coloured, with a few purple dotted lines; the lip and petals yellow, veined and tinged with brownish-purple.

It has been cultivated by Mr. Ashworth since early in 1894, and was first shown by him under the above name at the Wilmslow Chrysanthemum Show in 1895. In 1896 Mr. Ashworth again showed it at the Drill Hall, when Major Mason showed what appeared to be the same thing as *C. insigne* giganteum. *James O'Brien.*

TREES AND SHRUBS.

PYRUS crenata is one of the handsomest of the genus as regards its foliage, but it is not nearly so often seen as its merits entitle it to be. It is one of the Asia or White Beam section, with oblong-acute, crenated leaves about 7 inches long by 4 inches in breadth, and covered with fawn-coloured down on the under surface overlying the nerves. The leaf-stalk and the principal nerves are of a dull red colour. We can speak of it as a good town tree, well suited by its habit for squares and even streets, if it could be had in sufficient quantity. But what we wish specially to call attention to now is the manner in which the leaves remain on the tree, in spite of wind and rain, fog and frost. Though the days of its foliage are numbered, yet it has retained its leaves long after other trees in the neighbourhood have become bare. It was figured in the *Gardeners' Chronicle* for January 3, 1874, p. 17.

THE CRATÆGUS (THORNS).

Several little-known members of this genus may be recommended as being highly decorative when in flower or fruit. Especially is this the case with *Cratægus punctata*, or the spotted-fruited Thorn. Although this was introduced from North America as early as 1746, a specimen tree of it is by no means common. A fine tree, however, some 15 feet high, which I noted recently, had a strikingly ornamental appearance. Its large-sized fruits were produced in such profusion as to be very conspicuous. In colour they are bright scarlet or coral-red, with numerous small black dots, and are generally produced in clusters of from four to seven fruits. In size they are nearly as large as the berries of *Rosa rugosa*, but differ in shape. The tree flowers during May and June, and in colour are pure white. In this respect alone it is a valuable decorative tree. The foliage is quite distinct from that of the common

Thorn, being obovate and wedge-shaped, green in colour, glabrous above, and serrated along the margins, varying in length from 3 to 4 inches. It is generally propagated by grafting upon the common Thorn.

There are several varieties of this species which differ in habit and in the colour of their fruits, but all of them are worthy of notice. Probably the most common is *C. punctata rubra*, which has white flowers and deep red or crimson-coloured fruits. It is more spreading, and attains a height of from 20 to 30 feet. In its young state it has formidable thorns.

C. p. r. stricta has also crimson fruits and white flowers, but its habit is rather fastigate than spreading; it is, however, exceedingly ornamental.

C. p. aurea differs from all other varieties in having yellow fruit, which are covered with minute dots. Its habit is spreading, like that of *C. p. rubra*, and its leaves are ovate in shape, deeply dentated, and with much longer leaf-stalks. Its flowers are also white, and are produced in great abundance during May.

C. p. brevispina is very distinct; its fruits are large, and in colour deep purplish-red. It is probably more rare than any of the varieties, although sometimes seen as small trees in nurseries and botanic gardens.

Another species also very noticeable is the Douglas Thorn, *C. Douglasii*. In growth it forms a low-growing tree or shrub, seldom exceeding 15 feet in height. The fruits are very dark purple, and roundish in shape; they are produced in enormous quantities. The leaves vary in shape from oval to ovate, and are very deeply serrated. In colour they are green, advancing with age to purple, and are very glabrous on the upper surface. This is also a native of North America, and to judge from the specimens I have seen, it is a distinct and highly decorative tree. *E. S., Woking.*

THE ROCK GARDEN.

CROCUS LÆVIGATUS.

ALTHOUGH smaller than many of the late-flowering Crocuses, this species is valuable because of its prolonged flowering period, and its ability to withstand bad weather. The flowers are small, and are not elevated on long tubes; they thus offer but little opportunity to the winds and rains of autumn to injure them. The segments of the flower are of stout substance, and are produced in greater succession than those of most other species.

It is variable in its colour, so that an increased demand for it would probably lead to the introduction of several varieties not easily obtained at present. The segments vary in colour from purple to white, and there is much variation in the outer markings. In his *Monograph of the Genus Crocus*, plate xlix., Mr. George Maw figures four different markings or colourings of these outer segments, and others are to be met with among cultivated plants. The habitat of the species include the Morea, the mountains about Athens and the Cyclades. Its floriferousness is also observed by Mr. Maw, who says that the flowers appear "from the end of October to Christmas, and often late into the spring, many flowers being produced from each corm."

Although included in his monograph, *C. lævigatus* is not mentioned in the *Synopsis of the Genus Crocus* by the same writer, which appeared in the *Gardeners' Chronicle*, vol. xvi. (1881), p. 102 *et seq.*, to which I have often been indebted for much valuable information regarding the Crocus. This species is included among the nudiflora, or species without a basal spathe, and the section of Fibro-membranacei of Maw, and in Mr. J. G. Baker's arrangement in the section Schizostigma.

MR. WHITTALL'S GIANT SNOWDROP.

Those of us who have had the privilege of receiving from our open-hearted friend, Mr. Edward Whittall of Smyrna, bulbs of his newly-discovered variety of *Galanthus Elwesii*, have been watching expectantly the progress made by the plants. Now that some of

FIG. 140.—GLADIOLUS QUARTINIANUS SUPERBUS: COLOUR OF THE FLOWERS YELLOW, DEEPLY FLUSHED WITH CRIMSON.

the flowers have opened, we have an opportunity of estimating their worth and comparative size. It appears to the writer that this Snowdrop will be an acquisition. This is all the more pleasing, as one lot of bulbs received from him some years ago, and which he expected would yield superior flowers, proved a disappointment. I hope we may at length have an opportunity of attaching to a Snowdrop the name of one who has been at trouble, expense, and even danger, as we have so recently realised, to collect and distribute so liberally new plants to enrich our gardens. S. Arnott, Carsethorn, by Dumfries, N.B.

GLADIOLUS QUARTINIANUS SUPERBUS.*

FOR the opportunity of figuring this fine Gladiolus we are indebted to Mr. Tillett, of Norwich (fig. 140). The corms were received from Delagoa Bay, and when flowers were produced it was seen that they were much finer than those of the species as figured in the *Botanical Magazine*, t. 6739, on which account it has been named at Kew as a variety *superbus*. The species occurs over a wide area in tropical and sub-tropical Africa, and reaches a height of 8000 feet in Masailand. The colour of the flowers is yellow, deeply flushed with crimson.

SCOTLAND.

GLAMIS CASTLE, FORFAR.

I STARTED from the south of England at an early date in September, when the effect of the drought there was still painful to the eye. The pleasure was a great one then to visit the rich verdant glades in the county of Forfar, famed alike for its rich pasturage and delightful scenery. The county is pleasantly dotted with extensive estates, all of which are well timbered, and have very handsome gardens. Chief among them is Glamis Castle, the seat of the Earl of Strathmore. The Castle is no modern structure, but a substantial and noble-looking edifice, dating back to 1034, at which time it was a royal residence. (See Warden, in his *Ancient Castles*.) It was subsequently the scene of the death of King Malcolm II., but has been in the hands of the Lyon (or as formerly known, De Lyon) family since 1066.

The situation is about ten miles in a north-easterly direction from the thriving city of Dundee, and about four miles from Thrunis (Kerriemuir), the birth-place, and for many years the home of the world-wide known author, J. M. Barrie. The position is a sheltered one, and judging from the high state of agriculture in the immediate neighbourhood, the subsoil is a suitable one for garden crops generally.

The fine herd of polled Angus cattle on the Earl of Strathmore's estate, though primarily a testimony to the excellent system practised by the breeder, is in a lesser degree evidence of the uncommonly rich quality of the pasture. It will be remembered that the premier beast in the recent exhibition of the Smithfield Club was one from this herd, and the large number of such cattle that are to be seen at Glamis, form one of the most marked features upon the estate.

Landscape effects during the last century seem to have been very little studied, or practised, and the grounds surrounding the Castle have been disturbed but very little. The building stands out majestically from trees of noble mien, which, though by no means numerous, are yet sufficiently so to add such picturesqueness to the scene that no amount of modern gardening could better. There is not much flower-gardening immediately near the Castle, and it is so arranged that while the effect of a few small flower-beds may be seen from the windows overlooking, there is no vulgar glare to mar the peaceful aspect of the situation.

The kitchen and flower gardens are situated a little way from the mansion, and are so arranged that none

* *Gladiolus Quartinianus*, A. Rich., *Fl. Abyss.*, ii., 307; Baker, in *Bot. Mag.*, t. 6739; *Handbook of Iridaceae*, p. 213.

of the former, and but little of the latter, are seen from the windows; yet they are in close proximity, and readily get-at-able. On the occasion of my visit I was fortunate enough to find Mr. Wilson, the head gardener at home, and in just the spirit to discuss the various choice crops for which these gardens have long been famed.

The earlier crop of Grapes had been consumed, but in the main crop and later houses there were good crops of serviceable bunches; but here, as in several other gardens in Scotland which I visited, there were indications that the season had not been quite favourable to high-class Grape culture. Peach-trees were looking well, and bore evidence of careful culture.

Mr. Wilson and his employers were evidently fond of tuberous-rooted Begonias, as I remarked thousands of seedlings of much promise, besides a houseful of sturdy plants in the best possible condition, and they reminded me of similar displays in the Forest Hill nurseries.

Mr. Wilson has succumbed to the Malmaison Carnation craze, and I found the nucleus of a sound stock of the blush and pink-flowering varieties, in addition to several of the newer varieties raised in the gardens of Mr. Martin Smith.

Of Orchids, the deciduous *Calanthes* appear to predominate, and a structure is entirely devoted to their culture, which has proved very successful.

Kitchen-garden crops were all that could be desired, and afforded a pleasant contrast at the time to vegetable crops in southern gardens.

Adjoining a long walk leading to the flower-garden were extensive plantations of Border Carnations which had flowered, and numerous layers awaiting transplantation. The "grass" and remaining flower-stems bore unmistakable signs that a rich flower-harvest had been experienced.

In the flower-garden the modern "dot" system has not been closely followed, masses of Begonias, Pelargoniums, and *Calceolarias* being planted with charming effect. When thoroughly enjoying the picture these afforded, I was forced to the conclusion that if the surroundings be suitable, the system of "massing" the different plants in the flower-garden has many charms, that should not fail to merit appreciation. J. F.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By J. W. McHATTIE, Gardener to the Duke of WELLINGTON, Strathfieldsaye, Hants.

Savoy Cabbage.—The stamps of Early Ulm and Tom Thumb Savoy, the heads of which have been cut for use, should be pulled up and the land manured and dug, it being unprofitable to leave the stumps of dwarf Savoy with the idea of obtaining sprouts from them. The later and larger Savoy should be relieved of all decayed leaves or burst heads.

Celeriac.—Any plants of this crop remaining in the ground should be lifted and stored in damp sand, or if left in the ground some soil, straw, or bracken should be placed over the tubers as a protection against frost. Celeriac is a useful vegetable, and a delicious salad when cooked.

Small Salads.—Successional sowings of Mustard-and-Cress in shallow boxes should be made at intervals of four to five days, placing the boxes in mild heat. Some more Radish-seeds may be sown on mild hotbeds, or between the rows of the early forced Potatoes. A small quantity of Cabbage Lettuce-seed may be sown in shallow pans or boxes, and placed close to the glass in a warm house. The Lettuces growing in pits and frames and in the open border should be kept free from decaying foliage, air being given on fine days to those growing in frames. Chicory roots may be put into the Mushroom-house, or other warm, dark, moist place in order to keep up the succession of blanched heads.

Horseradish.—It is good practice to dig up the whole of the plants and store the best roots in sand, the thongs and small pieces being similarly reserved for making new plantations. These sets should by preference be straight pieces from 10 to 12 inches in length, with a single crown. The new plantation should occupy a piece of good land

that has been trenched and well manured, the manure being placed at the bottom. Sometimes Horse-radish is planted under the shade of trees or in some out-of-the-way corner; but this is mistaken practice, and I prefer to plant every year on fresh land in an open spot, the sets being dropped into deep holes (2 feet) at 14 inches apart. In shallow soil, excellent roots can be grown on ridges capable of holding three or four rows each, by which means a good depth of soil is obtained.

Sorrel.—If Sorrel be planted in such a manner that a frame or two can be placed over a few rows, the supply of leaves will be kept up even in the winter; and failing this method of forwarding growth, some of the roots may be lifted and forced in mild heat.

General Remarks.—At this season the future plan of cropping the garden should be sketched, and the quarters for and the extent of each of the more important crops decided upon. In this way, each crop can have the land that is to carry it suitably prepared. Most crops need manure, and some of them a great deal; others, like Peas, Leeks, &c., are the better for dressings of potash, or of salt, sulphate of ammonia; and all crops are benefited by a deep digging of the land.

PLANTS UNDER GLASS.

By W. MESSENGER, Gardener to H. C. BERNERS, Esq., Woolverstone Park, Ipswich.

Solanums.—To do these plants well, cuttings should be taken at an early date from plants that have not fruited, and which have been started in warmth. The soft-growing ends make good cuttings, and these strike readily in sandy soil when placed in bottom-heat of 75° to 80°. When rooted, let them be potted singly in small 60's. As the plants grow, the shoots should be pinched occasionally, to give increased bushiness. The too-oft repeated pinching gives a very compact form that is not liked by all persons, whereas two, or at the most, three, pinchings give a lighter, more graceful crown, with long shoots, and these, when well-berried, have a very pretty appearance. Repeated small shifts are required, and cultivation in an intermediate-house until the month of May, when they may go into cold frames, or out-of-doors.

Dracenas.—The tops of leggy plants which have been furnished with roots by one or other of the recognised methods, may now receive a small shift. Few plants are more easily checked, or which go back in condition quicker than *Dracenas* when the roots are much confined in pots. When repotting the newly-rooted tops, the new soil should be warmed, and the work performed in a warm-house, preferably where the plants are growing. Good drainage is very necessary, and water must be very carefully afforded, an excessively moist soil causing the roots to decay, or the plants to get generally into bad health. Let the plants be kept in a house having a warmth of 65° at night. Those plants which are repotted at this season will grow slowly, and be in excellent condition for repotting late in the month of February, and then with the increase of solar heat and light, growth will be rapid.

Codiaeums (Crotons).—It is not advisable to induce a too early growth in any of the stock of plants that are needed for immediate decorative purposes, as the lack of colour in the young foliage detracts from the beauty of the plants. The night warmth of the *Codiaeum*-house should not fall below 60°, and a small amount of air should be afforded when the weather is very favourable for so doing. This applies to the plants in use, as the cooler conditions hinder growth being made and conduce to hardness. The young plants which have to be pushed on early in the year being now in thumb or other small sizes of flower-pots, should receive, if much cramped at the roots, a small shift forthwith. Be particular in keeping *Codiaeums* thoroughly clean, and at this season the work of sponging can be done now with less injury than later, when the plants possess tender young foliage. Great care should be taken to guard against infestation by thrips.

Winter-flowering Begonias.—As the plants of Gloire de Lorraine cease flowering they should be cut down close to the soil, and placed in an intermediate-house, keeping the soil somewhat dry. Take cuttings when shoots fit for the purpose are obtainable, and insert them in sandy soil round the rim of the cutting-pot, striking them in a propagating-frame or under a bell-glass in the propagating-house. Begonia cuttings inserted early in the year are usually slow in making roots, and require much care. Batches of cuttings

may be inserted at intervals up to the end of the month of April, if succession of flowers are wanted. Later-flowering species and varieties should be encouraged, with occasional applications of manure-water and soot-water.

HARDY FRUIT GARDEN.

By W. H. DIVERS, Gardener to the Duke of Rutland, Belvoir Castle, Grantham.

Freshly-bought Trees.—As soon as convenient after fruit-trees have been obtained from the nurseries, they should be provided with durable labels, or disappointment may result, owing to the varietal names upon the parchment labels having become obliterated by the weather. Labels manufactured from metal, and bearing the requisite names stamped in raised letters, can now be purchased cheaply. These for practical purposes are indestructible, and may be conveniently nailed to walls or suspended by wires from trellises. For bush and pyramidal trees they are less suitable, as they may be moved by the wind, and the wires, by injuring the bark, prepare the way for canker. For such trees, large wooden labels are sometimes used; the stem is inserted into the ground, but it soon decays. An excellent system of labelling fruit-trees is to procure strips measuring 4 inches by 1½ inch of one-twelfth of an inch sheet-lead; the required names are then punched on to these with a set of ½-inch type letters fixed on to 2-inch iron punches, and by having a similar set of numbers from 0 to 9, the date of planting may also be added. Such labels can be made during wet weather by any intelligent labourer, and are capable of being easily affixed to the trees by curling them loosely around a small branch at a uniform height from the surface. There is no danger of the bark becoming cut, for the lead will expand according to the growth of the branch. They are imperishable, not unduly obtrusive, and can be used for trees against walls or trellises if required. The only attention that need be given them is that of removing the labels to another spot every alternate year, when the pruning of the trees is in hand. This may be done because the bark, so protected, is apt to become somewhat tender beneath. A "planting book" should be kept by every gardener, and it should contain a record of each tree, giving date and place of planting, space being left for the inclusion of any subsequent remarks that may suggest themselves.

FRUITS UNDER GLASS.

By G. NORMAN, Gardener to the Marquess of Salisbury, Hatfield House, Herts.

Late Grapes.—Though the latest-ripened Grapes could be kept in a fresh condition upon the Vines for some further time, it will be now advisable to remove them to the Grape-room, so that the Vines may be pruned whilst there is yet time for the cut parts to heal over before the sap becomes active, and thus prevent bleeding. The Vines should be given as long and complete a rest as possible. If the Grape-room was cleaned as recommended in my Calendar for Dec. 10, the floor and shelves, &c., will now be sufficiently dry; and assuming also that the bottles were three-parts filled with water containing a little powdered charcoal, everything will be ready for the work. Select a fine day for the removal of the Grapes, and cut the young wood that bears the bunches of fruit in the same manner as when pruning, making the incision in front of the prominent bud nearest to the Vine-rod. The wood that extends beyond the bunch should be left intact. During each stage in the operation of removing the Grapes every precaution will be necessary to prevent them from being shaken or rubbed. Examine every bunch carefully, and remove all berries that show signs of decay. Insert the shoots well into the water in the bottles, and see that the water does not reach sufficiently high in the neck of the bottle to run over on to the Grapes. Maintain an evenly dry atmosphere in the room, from about 45° to 50°; and give top ventilation on dry days from sunrise until dusk. In frosty weather fire-heat need only be used a little during the forenoon, and it should not be continued throughout the night unless the weather be extremely cold. The Grapes will need to be very frequently and carefully examined, and the least sign of decay should be removed as soon as it can be detected. In order to make the supply of Grapes last as long as possible, care must be taken to use first the kinds that will not keep so well as others. Muscats may be kept through January, afterwards Gros Colmar, Black Alicante, and Mrs. Pince, and latest of all Lady Downes' Seedling. When the Grapes have been put into the bottle, proceed with the work of pruning and

dressing the Vines. Cleanse the interior of the vinery, and complete the work as soon as possible. Admit abundant and continued ventilation to the house, it being necessary only to prevent the water in the pipes from becoming frozen.

The Early Vinery.—Permanent or pot Vines, the rods of which have been trained horizontally to induce the buds to open regularly, should be trained into position as soon as it is thought this end has been attained. If the work be delayed, it will be difficult to avoid breaking the young shoots. The rods need only be syringed once each fine day, and this work should be done in the morning. The floor and other surfaces may be sprinkled at other times. Increase the temperature of the house to about 55° at night, and 60° by day, with a rise of 10° to 15° from sun-heat. Vines for succession, that are expected to produce ripe Grapes by the end of the month of June, must now be given gentle heat, and treated according to the directions previously given in the case of earlier Vines.

THE FLOWER GARDEN.

By H. WALTERS, Gardener to Lord GERARD, Eastwell Park, Ashford, Kent.

General Remarks.—The recent sharp frosts experienced made it necessary to afford protection to such plants as are not quite hardy in this climate, by covering the tops and mulching the ground over the roots. Tea Roses are reckoned rather tender, and may be covered with dry bracken or straw, and the roots mulched. Recently-planted herbaceous perennials should be mulched with leaf-mould to the depth of an inch. During periods of hard frost, when walks can be wheeled upon without injury, manure should be taken to all beds, borders, and lawns requiring it. In wheeling on the lawn, planks should be laid down to wheel upon. In the case of heavy falls of snow it should be immediately shaken off the branches of Conifers, &c., with long poles bound round at the end with soft rags, so as not to cause injury to the bark whilst it is perhaps frozen. The snow is easily dislodged by raising the branches and then swaying them gently up and down. In mild weather the soil of beds and borders planted with Carnations should be made firm round the plants. Carnations wintering in frames or cold pits should be afforded air at all times when there is no actual frost, the lights being removed when the day is mild. Any plants arriving during frosts when the state of the ground makes it impracticable to plant them, should have the roots covered over with damp litter, or some soil or leaf-mould should be placed over them. Plants arriving in a frozen condition should be left to thaw in a cool damp place, and have water thrown over them. At this season leaf-heaps in process of rotting should be turned over, and the materials well mixed, and in the case of heaps two or more years old the finer particles should be removed by sifting, and conveyed to the soil store, the remainder being thrown together to rot still further.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Platyclinis (Dendrochilon) glumaceum has now commenced to make growth. It is a pretty species of dwarf and compact growth, and its numerous fragrant flowers being set on a long drooping spike, remind one of an ear of Barley. The plants will now require to be in the East Indian-house, and they will succeed either in pots or baskets. Re-potting or re-surfacing may be effected at once, as the young growths emit roots when about 2 inches high, and these will quickly enter the new soil in search of moisture. Unless they are supplied with this essential from the time the young growths appear, and until the flowers have passed, and the growth has become finished, the bulbs will be certain to be less in size than those last made. Fill the pots three-parts with drainage-material, and use ordinary peat and sphagnum-moss for a rooting medium. Sponge the under-sides of the leaves occasionally, or red-spider will be likely to effect mischief. *P. Cobbiana* and *P. uncata*, both of which are now in flower, grow well in shallow pans if suspended during the whole year near to the glass in the intermediate-house. *P. filiformis* should be grown in the same temperature. Although the plant is now at rest, it will need to be kept moist at the root, and if a good overhead syringing be given every week, it will assist to keep the bulbs plump, and the foliage fresh and green.

Dendrobiums.—These plants are always a feature in the Orchid-house when in bloom. For some time past most of the plants have been resting, but now *D. Wardianum*, *D. crassinode*, *D. Aspasia* ×, *D. micans* ×, *D. Wardiano-japonicum* ×, and a few others are already starting into growth, showing their flower-buds on the pseudo-bulbs that were last formed. Notwithstanding these signs of renewed growth, the cultivator should not be tempted to afford them any water unless the flowering bulbs themselves begin to shrivel; nor should such plants be afforded a higher temperature, or the new breaks will grow too rapidly, arresting the full development of the blossoms. Whilst the plants are kept in a moderately dry and cool house, new growth will remain almost stationary. Let each such plant be accustomed to a little more warmth as the flower-buds begin to expand. *Dendrobium moniliforme*, *D. tortile*, *D. heterocarpum* (aureum), the numerous varieties of *D. nobile*, and the garden hybrids, *D. Dominianum*, *D. Juno*, *D. Rainbow*, *D. Ainsworthi*, *D. Cassiope*, *D. splendidissimum grandiflorum*, *D. Schneiderianum*, *D. Leechianum*, *D. endocharis*, *D. melanodiscus*, *D. Luna*, *D. pallens*, *D. Cybele*, *D. Euterpe*, *D. Clío*, *D. chrysodiscus*, *D. xanthocentrum*, *D. Burfordiense*, and others which have not the propensity to start prematurely, may, when their flower-buds appear, be brought from their resting quarters into an intermediate-house, where the temperature at night is kept at about 55°, and here they should stay till the flower-buds begin to expand, and be then removed to the lightest available position in the East Indian-house. Water should be very sparingly afforded to these *Dendrobiums*, as any great excitement at this period may spoil the constitution of many a valuable plant. In houses which are naturally moist, the plants may make good progress without any water being afforded. After the plants are removed to the warmer house, lightly syringe them overhead with tepid rain-water on sunny days till the flowers open. Where many plants of *D. nobile* are cultivated, some of them will now be in bloom, and others approaching that stage, and a regular supply of flowers may be obtained during a period of several months by placing the earliest-ripened plants in gentle warmth as they are required. Such varieties as *D. cretaceum*, *D. crepidatum*, *D. albo-sanguineum*, *D. rhodopterigerum*, *D. Parishii*, *D. superbum*, *D. primum*, *D. Bensoniæ*, *D. nodatum*, and *D. purpureum*, if they are allowed to remain in the East Indian-house whilst at rest, bloom profusely in the spring if they are prevented from shrivelling unduly. If these species are properly matured, but very little water is required by them whilst at rest. *D. undulatum*, *D. stratiotes*, *D. taurinum*, *D. secundum*, *D. amboinense*, *D. bigibbum*, *D. Phalenopsis*, *D. spectabile*, *D. Johnsoniæ*, and *D. velutinum*, should be kept in the hottest house at all times, and be afforded abundance of water whilst growing, and not kept too dry after growth is completed, otherwise the leaves will become spotted. All of these plants bloom from the top of the newly-made growth, and not unfrequently from the old pseudo-bulbs.

The Intermediate-house.—Those plants of *Cypripedium Spicerianum* and *C. Charlesworthi* which have recently passed out of bloom may be repotted if the operation be found necessary. When repotting them let the base of each plant be elevated well above the rim of the pot. In this house *Cypripedium Leeanaum*, *C. L. giganteum*, *C. L. Albertianum*, *C. purpureum*, *C. villosum*, *C. Sallieri*, *Hycanum*, *C. Arthurianum*, *C. vexillarium*, *C. Juno*, *C. Statterianum*, *C. venustum*, *C. calophyllum*, *C. Schlimi*, *C. Williamsii*, *C. insigne*, and its distinct varieties, *C. i. punctatum violaceum*, *C. i. Sanderiæ*, &c., being in full bloom, are making a delightful display. Fortunately, these are plants of easy culture, their chief requirements being well-drained pots and the ordinary sort of Orchid-compost. A rather shady part of the house, and water freely afforded them at all times, is best for them. *Cymbidium Mastersii* and *C. Tracyanum* are also in flower, *C. eburneum* and *C. Lowianum* are showing their spikes. These beautiful species succeed when treated to less heat than is generally afforded them, the coolest part of an intermediate-house, as far away from the hot-water pipes as possible, suits them well. In such case the foliage will remain of a much better colour, and be less liable to spotting than when grown in houses having more warmth. Any plants of these species named which may have become pot-bound should be afforded ample supplies of water at the root at all times. After flowering is a good time to repot them, growth soon recommencing.

General hints on treatment.—The entire collection of Orchids will now require careful treatment in regard to aerial moisture, as any excess, if accompanied by a low temperature, will cause damping and spot; on the other hand, if the ground under the hot-water pipes or the walks is kept too dry, thrips will multiply and soon disfigure the young growths and flower-spikes. Fortunately, it is now of rare occurrence to find rare and valuable Orchids deteriorating through the ravages of insects. XL-All vaporiser is a safe and sure insecticide to use in such cases.

THE APIARY.

By EXPERT.

Protecting Hives during Storms.—We have before described a simple method of guarding against mishaps during storms. A stout stake is driven into the ground on one side of the hive, and to this is attached a rope or strong cord, at the end of which are suspended a couple of bricks. As bee-houses may be very easily upset when standing in the open, those who still practise this form of protection for hives should always drive four strong posts down, one at each corner, about a yard away, to which strong wire or ropes may be fixed as "stays" from September until March. Hives without legs are much less liable to be overturned by the wind, but very ordinary care will prevent mischief happening to hives with legs or on stands; and there are so many disadvantages when floor-boards are directly in contact with the ground that all such should be raised 9 or 10 inches at least during the winter months. Not only are the bees kept in better health thereby, but all the disagreeable things which usually harbour about damp wood, such as snails, woodlice, slugs, &c., are prevented. Precautions should be made against leaky roofs. Snow-water will penetrate through should there be the least fault or crack, and wet quilts usually mean a generally bad condition in the interior. We do not object at all to have hives snowed over for weeks—with entrances snowed up as well for that matter, but directly a thaw comes the accumulated snow should be scraped off and not allowed to gradually melt on hive-roofs, unless it is known that the latter are perfectly watertight. We are every year more impressed with the advantages of keeping bees entirely free from disturbance during December and for three or four months afterwards. In a well-managed apiary nothing, save a glance at entrances, to clear them of dead bees, should be needed. It is well that this is so, for there are such a multitude of odd jobs to occupy the attention of the bee-keeper that we should despair of keeping pace with them if bees required any attention at the same time. In the old times the harvesting of his produce was the main work in the bee-keeper's year; to-day we can give "work for the month" in twelve parts, each one detailing little items of work unknown to our fathers, but which bring more or less advantage to the apiarian, and help to fill up the measure of his success. A great portion, however, of the work during December must necessarily consist of preparations for next season. It will be found most useful if such notes as have been taken in the course of past years are carefully studied, in order to ascertain how far the various plans tried have succeeded or failed. Of course, we do not suppose that every one of our readers trouble to take any notes at all of their beework—many would get on a great deal better if they did. Nevertheless, there is, to our mind, such a fund of never-ending interest in them, and we find them so useful to us in arranging our "work for the month," that we cordially invite those who think it "too much bother" just to try it for a season.

A SWISS POTATO PIE.—Choose medium-sized, sound Potatoes, and after boiling or steaming them in the usual way, allow them to cool; then cut them in slices a quarter-of-an-inch thick, and arrange a single layer of these at the bottom of a well-buttered pie-dish; sprinkle the Potatoes well with salt, pepper, finely-chopped Onion, minced Parsley, and grated cheese, then cover with a few tablespoonfuls of thick white sauce, and repeat in this order until the dish is sufficiently full, letting sauce form the last addition, except a sprinkling of grated cheese, which should be added just before putting the pie in the oven; see that the latter is well heated, then, as soon as the pie is thoroughly hot, and coloured a nice golden-brown, serve tastefully, the surface being sprinkled with a mixture of finely-chopped Parsley and sifted egg-yolk, the pie-dish being placed upon a pretty dish-paper, with a border of Parsley-sprigs arranged round about.

APPOINTMENTS FOR JANUARY.

TUESDAY,	JAN. 10	Royal Horticultural Society's Committees meet. Scottish Horticultural Association meet. Royal Horticultural Society of Ireland meet.
SATURDAY,	JAN. 14	Royal Botanic Society meet. Isle of Wight Horticultural Improvement Soc. (annual meeting).
MONDAY,	JAN. 16	National Chrysanthemum Society's General Committees meet.
THURSDAY,	JAN. 19	Annual Meeting and Election of Pensioners of the Gardeners' Royal Benevolent Institution, at "Simpson's," Strand.
TUESDAY,	JAN. 24	Royal Scottish Arboricultural Society (annual meeting).
SATURDAY,	JAN. 28	Royal Botanic Society meet.
TUESDAY,	JAN. 31	Royal Horticultural Society's Committees meet.

SALES FOR THE ENSUING WEEK.

MONDAY,	JAN. 2	Roses, Hardy Perennials, Lilies, Gloxinias, &c., at Protheroe & Morris' Rooms.
TUESDAY,	JAN. 3	Hardy Border Bulbs and Plants, Roses, Lilies, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	JAN. 4	Japanese Lilies, Tuberoses, Palm-seeds, Spiræas, Lily of the Valley, &c., at Protheroe & Morris' Rooms.
THURSDAY,	JAN. 5	Hardy Perennials, Iris, Anemones, Carnations, &c., at Protheroe & Morris' Rooms.
FRIDAY,	JAN. 6	English-grown Lilies, Tigridias, Spiræas, Pæonies, and Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—36°5'.

ACTUAL TEMPERATURES:—

LONDON.—December 23 (6 P.M.): Max., 47°; Min., 39°.
PROVINCES.—December 23 (6 P.M.): Max., 48°, Scilly;
Min., 38°, Aberdeen.
Mild, stormy, much rain.

Retrospect.

THE last number of the year offers a fitting occasion to look back to see what progress has been made in the past, and in what hopes we may safely indulge for the coming one.

The chief event of the horticultural year was the great Quinquennial show at Ghent in April. It was characterised by its usual magnificence, and more than its usual magnitude. It was interesting for its display of new plants, described and figured in our columns at the time, and equally if not more so for the exhibition of older plants discovered or introduced by the late JOHN LINDEN, and got together by the filial piety of M. LUCIEN LINDEN. A more worthy tribute to the memory of a botanist and horticulturist can hardly be imagined. The kindness and hospitality of our Belgian friends were as marked as ever. His Majesty the King of the BELGIANS, not content with paying a long and appreciative visit to the exhibition, and renewing his acquaintance with many of the visitors, conferred on the members of the jury the signal honour of inviting them to a garden-party at Laeken on the occasion of the reception of the diplomatic body, the ecclesiastical dignitaries, and the Ministers of State. This was a special honour which was highly appreciated by the guests, the more so as the reception took place in the conservatory and its adjoining corridors, which form so remarkable a feature of the royal residence.

The care of these very extensive glass-houses, including the conservatory-chapel, long entrusted to the late Mr. KNIGHT, is now confided to M. VAN OBERGEN, who deservedly received the congratulations of the visitors.

The occasion of the Ghent Show was made the opportunity for the presentation of the Veitch Memorial Medals, allotted each year to distinguished horticulturists of whatever nation. This time the Medals were conferred on M. le Comte de KERCHOVE, the author of the *Livre des Orchidées*, and the treatise entitled *Les Palmiers*, the energetic, tactful, and genial Presi-

dent of the Botanical and Agricultural Society of Ghent, under whose auspices these quinquennial gatherings are undertaken. Two other Medals were allotted on this occasion, one to M. ED. ANDRÉ, the Editor of the *Revue Horticole*, and distinguished alike as a landscape-gardener and a botanical traveller; the other to M. MARLIAC, the raiser of the very beautiful hybrid Nymphæas, which contribute so largely to the adornment of our gardens.

In comparison to the great Ghent Show, the other exhibitions of the year seem small, though they present some features which even Ghent cannot rival. The fortnightly meetings of the Royal Horticultural Society have been kept up throughout the year in a way which is as satisfactory as it is surprising, and the lectures given before the Society have at least been fully up to the average in interest. A similar remark may be made in relation to the Temple Show in May, and to the Great Fruit Show in the autumn.

The Temple Show of 1898 will always be remembered by a circumstance, the thought of which fills our minds with sorrow and humiliation—we allude to the abstraction of the Orchids belonging to a foreign exhibitor, M. JULES HYE. Although the officials of the Society were not to blame in the matter, this made a most painful impression at the time, and it is a subject for great regret that no tidings have ever been received as to the missing Orchids.

The National Co-operative Show at the Crystal Palace was one of great extent, and much significance, as showing the progress of gardening among the working-classes.

In the provinces equal activity has prevailed, and the great exhibition at Shrewsbury once more attracted the gardeners from all parts of the country, and elicited the warmest commendations. If we fail to mention other towns whose horticultural exhibitions have been noteworthy, it is simply from want of space. The shows have been as numerous and as important as ever, but they are still looked on too exclusively as holiday displays, and opportunities for prize-winning; whilst the educational element is neglected.

In late autumn the Chrysanthemum shows were, as usual, extremely numerous and the quality of the exhibits excellent, and much better than might have been anticipated from the trying nature of the season, and the presence of a rust-fungus on the foliage. There is at present no sign that the taste for these brilliant flowers is on the wane. Indeed, as the flowers increase each year in brilliancy and refinement, we trust the day of their decadence will be long deferred. There is nothing that can take their place for decorative effect at this dull season of the year. Exhibitors need reminding, however, that size by itself is not a recommendation, and that a well-grown, well-flowered plant is a more pleasing object than the abnormal specimens resulting from wholesale disbudding.

The summer and autumn of 1898 were marked, like those of the preceding year, by a prolonged period of heat and drought. So prolonged was it that serious results were anticipated, and, indeed, in many places the want of water was a source of the greatest inconvenience. The effect on the crops, though well marked, was on the whole less injurious than might have been anticipated. Doubtless we have not seen the end of it yet, and for some time to come, sickly and dying trees will testify to the injury inflicted by lack of moisture and by excessive sun-heat in the seasons of 1897 and 1898.

The fruit-crops on the whole were below average, the Apple and Plum-crops notably were reported as deficient, but those who saw the very splendid displays of Apples made at the Royal Horticultural Society's show from Kenby Mr. WOODWARD, gardener at Barham Court, and Messrs. BUNYARD, of Maidstone, might well doubt the existence of any untoward influence. The quality of these fruits was very remarkable, and afforded a proof that good cultivation tells, and that neglect, and bad cultivation, are sure causes of failure.

The stir that has been made of late years in the matter of fruit-culture has had its effect, and may be seen, not only from the enhanced quality of the fruits put on the exhibition-table, but also in the extended area of fruit-production.

Commercially, the year has, we believe, been a prosperous one for the trade. The most important matter for market gardeners is the decision of the Master of the Rolls, reported in full in our columns on March 19, that "buildings" are not rateable as agricultural land. This subject has been discussed before various Judges with varying results, so that it is now proposed, in order to settle the matter finally, to seek the intervention of the House of Lords. It is most devoutly to be hoped that the decision will be favourable to the growers. Few things are more remarkable than the vast development of market gardening under glass during the last quarter of a century. In proportion as agriculture has declined, market gardening has prospered. If the industry is to be throttled by fiscal regulations it is to be feared that home industries will suffer even more severely than they do at present by competition with foreign imports.

The obituary list, always a melancholy record, is perhaps not so heavy as it has been in some other years. The death of JOHN LINDEN at a ripe age removed from us one of the most enterprising of botanical travellers, and one who, by his numerous introductions, has left a name which will be remembered so long as gardening lasts. Amongst other names we find those of Prof. KIRK, the author of *The Forest Flora of New Zealand*; of KERNER the famous Viennese botanist, of Dr. PATERSON the genial Scotch doctor who was so enthusiastic a gardener, of General BERKELEY who inherited the tastes of his famous father, of CULLINGFORD of florist-flower fame, of Baron FERDINAND DE ROTHSCHILD the keen connoisseur, and of many others inserted in our record, but whom it is not necessary to specify on this occasion—their works do live after them.

**** OUR ALMANAC.**—According to our usual practice we shall issue in our next number a *Gardeners' Chronicle Almanac* for the Year 1899. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and allied Societies, or any of our correspondents, will send us immediate intimation of all fixtures for the coming year.

BRITISH ASSOCIATION.—The meeting next year is to be held at Dover in September next, under the presidency of Prof. MICHAEL FOSTER. We are glad to learn that the corresponding French society will hold its meetings at Boulogne about the same time, and that an interchange of visits will take place between the members of the two bodies. The more numerous such interchange of courtesies the better for science, and the better for the peoples of the two nationalities.

EGYPT IN PRE-HISTORIC TIMES.—Professor PETRIE has discovered objects in excavating in various parts of Egypt which go to show the existence of a highly-civilised race belonging to a period of about 5000 or even more years, B.C. This race differed from the Egyptians of later date, and is taken to furnish evidence of the close of the pre-historic period, and the developments of the civilisation of Egypt, and the composition of a race which has maintained its character for 6000 years.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, January 9, 1899, when the adjourned discussion on the paper, read by Mr. WM. WEAVER (Fellow) at the last meeting, entitled "The London Building Act and the official Supervision of Buildings," will be resumed. The chair will be taken at 8 o'clock. Notice is given that the Institution will be closed from Thursday evening, the 22nd inst., to Wednesday morning, the 28th inst.

"SCIENCE GOSSIP."—After a successful career of over thirty years, *Science Gossip*, the favourite

Society for upwards of twenty years, has retired from his position on account of impaired health. The Committee feel that some expression of the appreciation felt for Mr. LAZENBY's services should be made, and are in consequence organising a testimonial to be presented to Mr. LAZENBY. Those desirous of taking part in this object should place themselves in communication with Mr. B. B. PANNETT 92, Union Terrace, York.

IMPERIAL PENNY POST.—The first despatch of Imperial Penny Post to India and the colonies (except Australia), will carry a letter, expressed in

PORTO RICO.—Very little, says *Nature*, is known of the flora of Porto Rico. An American citizen, Mr. CORNELIUS VANDERBILT, has offered to bear the expense of a botanical expedition to the island by Mr. A. A. HELLER, under the auspices of the Director of the New York Botanical Garden.

A PROPOSED HORTICULTURAL SOCIETY.—At a meeting held recently of the leading gardeners and others in the district of Hamilton, N.B., it was decided that there was need for a local Horticultural and Forestry Association.

FIG. 141.—DENDROBIUM FORMOSUM GIGANTEUM, AT GUNNERSBURY HOUSE, ACTON.

The flower seen in the left-hand corner is specially enlarged. (See p. 472.)

journal for amateurs devoted to Natural, Physical, and Applied Science, has just entered upon independent offices at 110, Strand. This magazine has latterly been greatly improved, and the articles deal with subjects of most recent discovery or theory. The editorial management is still under the control of Mr. JOHN T. CARRINGTON, assisted by Miss F. WINSTONE. There are also several specialists as departmental editors for such sections as Physics, Microscopy, Astronomy, Botany, Geology, Zoology, Meteorology, &c.

ANCIENT SOCIETY OF YORK FLORISTS.—Mr. LAZENBY, who has been the Secretary to the

happy sentiments, to our colonial sisters, which the author of Imperial Penny Post, Mr. HENNIKER HEATON, M.P., has specially written to accompany a message of greeting from the editor of *The Gentlewoman*, which is being sent to every gentlewoman in every British colony, whose name and address were obtainable.

THE METRIC SYSTEM.—The Board of Trade has received information that a large contract for railway work in Norway has been placed in Antwerp owing to the unwillingness of our makers to adopt the simple metrical system in place of the complicated, cumbrous, and inconsequent system followed in the British Isles.

INDEX OF FUNGI.—Another of those colossal publications with which German patience has enriched science is that by Mr. SYDOW, entitled *Index universalis et locupletissimus nominum Plantarum hospitum specierumque omnium Fungorum has inco-lentium*. In other words, it is an alphabetical list of the names of plants, together with an enumeration of the fungi which have been recorded as occurring on each. Thus it appears that the Potato is attacked by no fewer than 105 species of fungi; the Lilac (*Syringa*) by 111; eight pages large 8vo are devoted to the names of fungi attacking the various species of Elm; nine or ten similar pages record the parasites of the Vine and its immediate

allies; twenty-five pages are required for the enumeration of the species attacking the members of the genus *Pinus*—eight pages being occupied with the names of fungi attacking one species, *Pinus silvestris*, and so forth. With such formidable enemies in such prodigious numbers, it is wonderful how plants manage to survive at all. It should be stated that this astonishing index is the index to the descriptive work of SACCARDO, indispensable, but almost stupefying. The book is naturally costly. It may be had from Messrs. WILLIAMS & NORGATE.

ROYAL BOTANIC SOCIETY.—A new departure, as the phrase goes, is announced on the part of the Society. It takes the form of a series of lectures on "Seeds and Seed-testing," by Mr. D. FINLAYSON. The lectures will be delivered in the museum of the Royal Botanic Gardens in the early spring of 1899, on Monday afternoons, at 3.30 P.M., commencing January 23, for the benefit of students of agriculture, horticulture, landscape gardening, and of botany generally. The lectures will deal with the identification and testing of farm and garden-seeds, and the selection of seeds for lawns, cricket-fields, and pasture-land. The following are the proposed arrangements:—

I.—January 23, 1899.—Relative value of samples, considered in relation to colour, size, uniformity, condition, maturity, age, purity of samples, essentials to germination, pedigree influence.

Adulteration and doctoring of seed.

II.—January 30.—Effect of age of seed on its rapidity of growth, and liability to disease. Soil suitable. Change of seed, why necessary. Quantity of seed per acre.

Grass Seeds. *Alopecurus pratensis* (Meadow Foxtail). *Dactylis glomerata* (Rough Cocksfoot). *Festuca elatior* (Tall Fescue).

Impurities specified and described.

III.—February 6.—*Phleum pratense* (Timothy). *Avena elatior* (Tall Oat-grass). *Lolium perenne* (Perennial Rye-grass). *Lolium italicum* (Italian Rye-grass). *Festuca pratensis* (Meadow Fescue).

Impurities specified and described.

IV.—February 13.—*Agrostis stolonifera* (Fiorin). *Avena flavescens* (Yellow Oat-grass). *Poa pratensis* (Smooth-stalked Meadow-grass). *Poa trivialis* (Rough-stalked Meadow-grass). *Poa nemoralis* (Evergreen Meadow-grass). *Poa compressa* (Flat-stemmed Meadow-grass).

Impurities specified and described.

V.—February 20.—*Anthoxanthum odoratum* (Sweet-scented Vernal-grass). *Cynosurus cristatus* (Crested Dogtail). *Festuca rubra* (Red Fescue). *Festuca duriuscula* (Hard Fescue). *Festuca ovina tenuifolia* (Sheep's Fescue).

Impurities specified and described.

VI.—February 27.—Cereals. Wheat, Barley, Oat, Rye.

VII.—March 6.—Clover Seeds. *Trifolium pratense* (Red Clover). *Trifolium pratense perenne* (Perennial Red, or Cow-grass). *Trifolium repens* (White Clover). *Trifolium hybridum* (Alsike Clover). *Medicago lupulina* (Trefoil).

Impurities specified and described.

VIII.—March 13.—*Medicago sativa* (Lucerne). *Onobrychis sativa* (Sainfoin). *Trifolium minus* (Suckling Clover). *Trifolium incarnatum* (Crimson Clover).

IX.—March 20.—Special purpose grasses and other plants, namely:—*Achillea millefolium* (Yarrow). *Anthyllis vulneraria* (Kidney Vetch). *Ammophila arundinacea* (Sand Reed-grass). *Elymus arenarius* (Sea Lyme-grass). *Bromus inermis* (Hungarian Forage grass). *Bromus Schraderi* (Schrader's Brome-grass). *Phalaris arundinacea* (Reed-like Canary-grass). *Poa aquatica*.

(a) Collection of Vegetable Seeds (various).

(b) " Flower " "

X.—March 27.—The best turf produced by seedling and good management. Composition of good and bad mixtures of seeds for Lawns, Cricket-fields, Golf-links, temporary and permanent pastures. Preparation of the soil, selection of suitable seeds, sowing the seed, and after-management.

All the seeds enumerated above can be examined by each individual pupil, as well as growing examples of each plant, and specimens of the finest grass-turf grown from seed.

THE ROYAL GARDENERS' ORPHAN FUND.

A meeting of the Executive Committee was held on the 21st inst. at the Horticultural Club, Mr. W. MARSHALL in the chair, when the following special donations were announced:—Altrincham Gardeners' Society, proceeds of concert, £15 10s.; Scottish Horticultural Association, £15; Canterbury Hospital and Charities' Fête, £5; Mr. H. Herbst, Kew Road, Richmond, box, £5; Chislehurst Gardeners' Society, £3 14s.; Penshurst Gardeners' Society, £3 3s. 6d.; Mr. J. Selway, Betteshanger, box, £2 10s.; Tonbridge Gardeners' Society, £2 2s.; collected at a Committee Meeting of the National Chrysanthemum Society, 16s. 7d.; C. Herrin, Dropmore, Maidenhead, 10s.; Mr. Geo. Cuthbert, Southgate, box, 10s.; Mr. F. Dodds, Herringswell, Mildenhall, box, 7s. 6d. Eighteen applications on behalf of orphan children were made and passed, and it was decided that nine candidates should be elected at the annual meeting on February 17. Mr. THOMAS PEED, of Norwood, was elected a member of the committee in the place of Mr. G. W. CUMMINS (resigned). Mr. A. F. BARRON announced his resignation of the office of secretary to the Fund, and it was resolved that the vacancy should be advertised, and applications invited. A vote of thanks was passed to the chairman.

A HOUSEFUL OF DENDROBIUM FORMOSUM GIGANTEUM.

Our central illustration in the present issue shows a houseful of *Dendrobiums* in Messrs. de Rothschild's garden at Gunnersbury House, Acton, as it appeared in September last, when the plants were at their best. Mr. J. Hudson, the gardener, kindly furnishes the following particulars concerning these plants:—

"At that time there were about 34 plants either in flower or bud, with an aggregate of 680 expanded blooms or buds. The plants were bought from importations during the past two seasons, and were received about the end of the month of March, when they, together with those of last year, were put into as small baskets as it was possible to get them into, and forthwith started into growth under the ordinary stove treatment afforded at that season. I could not give these plants just the position I should have liked, as the fruit crops had first to be considered. Towards the end of the month of May, when a span-roof pot-vinery was cleared of its crop of fruit, they were arranged with others in it. Thence onward till the end of August the plants remained in this house hung up close to the glass, but not touching it, and without any shade whatever being afforded, even during the hottest summer weather. The house has a south-east and north-west aspect, the plants hanging on the latter side of the span, where, although they did not receive the full force of the sun in the early part of the day, they did so during the afternoon, when the house was closed. From the start to the finish hot treatment was afforded; the temperature ranged from 70° to 80° at nightfall and 90° to 95° and even more during the day when air was afforded. When closed, the thermometer frequently indicated 100° to 110° for a space of time. Atmospheric moisture was supplied abundantly, and the plants were frequently dipped in a vessel of water in addition to this. The first few flowers which expanded about the last week in July possessed quite as much substance, and were as large, lasting, too, equally as well as later in the season. The full sunshine seemed to have no effect upon the duration of the flowers, or in any other particular. The growth made under these conditions was robust, and short-jointed. As an indication

that the treatment is suitable to the needs of the species, I might add that I have one plant that was purchased some six years ago, which, under the ordinary stove treatment all the year round, with shade during the summer, gradually declined, and would by this time have died, had it not received the same kind of treatment as my plants of *Dendrobium formosum*, and now it seems to have got a new lease of life. For effect and for convenience sake, the plants, when the photograph was taken, were hung in another house, the roof of which is of the old kind, whereas the vinery in which the plants were grown is quite modern, with panes of glass 20 inches by 15 inches. During the time of flowering, and onwards until May of next year, the treatment given is that of an average plant-stove.

"When out of flower, the plants are kept dry, but the pseudo-bulbs are not allowed to shrivel. Self-sown seedlings are appearing on several of these plants—last year's in particular, some of which I hope to flower next year. In addition to the ordinary compost used for *Dendrobies*, I have made a free use of virgin-cork—a substance that is retentive of moisture, and that does not turn sour; moreover, it affords the plants a perfectly natural rooting medium. It is broken up, and used as is charcoal, only perhaps the pieces are larger."

A NEW COLCHICUM.

WE add a figure of another pretty plant for early spring-flowering, introduced by Mr. Siehe, of Mersina, Asia Minor, who found plants of it in swampy ground and moist meadows, near Gullis, at an altitude of 1000 metres above sea-level. The flowers, of a rosy-red colour, make it, as Mr. Siehe tells us, "a most delightful plant." It should prove a capital addition to our spring flowers. The base of rockeries, where the moisture is usually abundant, by the margin of lakes and streams and similar sites, would suit its requirements. It would be wise to exercise caution in planting the bulb in quantity in land liable to be fed off, the foliage of *Colchicums* being of a poisonous nature. Our illustration (fig. 142) represents the plant of its natural size.

[We have not ourselves seen the plant, so that we can say nothing as to its correct name. Ed.]

RABBITS.*

THE scope of this book is well defined in the preface by Alfred E. T. Watson, who speaks of it as one of a series of Fur, Feather, and Fin monographs, "as complete as they can possibly be made, on the various English birds, beasts, and fishes which are generally included under the head of game." The author starts his rabbit by references from early classic writers, and pursues him through the stages of a short and troubled life to his inevitable end. The book is pleasantly and interestingly written, and the illustrations of varying degrees of excellence.

The portion of the volume that most nearly concerns us here relates to the food of the rabbit; the following extract from the first chapter will, in consequence, interest many readers:—

"Rabbits are unquestionably the kind of stock to make the finest turf; they bite closer than any other animal that grazes, and the best turf for gardens is that taken from warrens, or from downs on which rabbits abounded. Sandy commons covered with Furze are a favourite resort of rabbits, and on such ground they often increase rapidly in numbers. The soil being light and friable, is easily excavated, and the Furze affords not only a secure retreat, but a never-failing supply of food in the young tops of the plants, which are sufficiently tender before the spines have become matured.

In the choice of food, rabbits do not appear to be very particular. They will eat almost anything that is green. Indeed, so destructive are they to most plants and young growing trees, that it is a matter of importance to game-preservers, who want underwood in the coverts as shelter for pheasants, to ascertain what plants are 'rabbit-proof.' Common *Rhododendron*, though not absolutely 'rabbit-proof,' is not so liable to be attacked as many other shrubs. It will grow in shady places better than any other evergreen,

* *The Rabbit*, by James Edmund Harting; with a chapter on cookery by Alexander Innes Shand. Illustrations by Archibald Thorburn, G. E. Lodge, S. Alken, and Charles Whymper (Longmans, Green & Co., 39, Paternoster Row).

especially if the soil is sandy and moist. But, although as a rule, rabbits will not injure Rhododendrons when the latter are well established, they will gnaw them when freshly planted unless protected, like Aucubas. It is said that they will not touch Rhododendron ponticum, even if the plants are small, and the winter severe. Nor will they feed upon Elder, which has the recommendation of growing well under trees, and when plucked (or 'plashed,' as it is termed locally) rabbits will lie well under it. They are not to be trusted near Hollies or young Osiers. Indeed, they seem to be rather partial to Hollies, and in time of snow will attack even old trees. In hard weather, too, both Laurel and Privet suffer from their depredations. The larger kinds of Box, Snowberry-plant (*Symphoricarpos*), and Butcher's-broom (*Ruscus aculeatus*), are recommended where the soil is favourable to their growth; and for wet places, Scarlet Dogwood (*Cornus sanguinea*). In moist woods, too, a good thing to plant is *Carex pendula*, a common Sedge, which forms good evergreen ground-cover, and is very free. In like soil the Wood-rush, Briar, and Wood-grass (*Aira*), may be recommended.

In the way of berried shrubs, nothing is more beautiful than a well-grown specimen of *Cotoneaster affinis*. Every

out of shot, for the reason that there is nothing to hide them. The owner of the covert will, perhaps, say he can get nothing to grow under the spread and drip of the trees. This need not necessarily be so. Several shrubs might be named which will thrive under such conditions; but the planter would be well advised if, instead of scattering the different kinds singly all over the ground at wide distances apart, he were to plant them in clumps—say each plant 3 to 4 feet apart—and a mixture of a few kinds in masses, taking care to keep the low-growing and less straggling sorts next to the wood-rides. Amongst those adapted to such treatment may be mentioned:—Common and Portugal Laurels, Rhododendron ponticum, *Azalea pontica*, *Taxus baccata*, *Ruscus aculeatus* and *R. hypoglossum*, *Cotoneaster buxifolia*, *C. microphylla* and *C. Hookeri*, *Pernettya mucronata* (for peat soils), *Phillyrea* of sorts, *Rhamnus alaternus*, Broom, *Lycocateria formosa*, Box of sorts, *Juniperus communis* and *J. Sabina*, *Potentilla fruticosa*, *Buddleia globosa*, *Viburnum lantana* and *V. Opulus*, *Gaultheria Shallon*, *Ribes* of sorts, *Weigela rosea*, *Euonymus europæus*, *Berberis aquifolium*, *B. dulcis*, *B. Darwini*, *B. vulgaris* and *B. vulgaris purpurea*, *Hippophae rhamnoides* and *H. angustifolia*, *Arbutus Unedo*, *Garrya elliptica*, *Rosa rubiginosa*, *Symphoria racemosa*.

mended the Corsican Pine as the only tree untouched by rabbits where planted with *Pinus sylvestris* and black Austrian Pine; but this only shows that where several different kinds are growing together, the Corsican Pine may be the least appreciated. In a woody district in Sussex, where a field was planted with this, it was found that nearly every plant was gnawed and injured. Although the shoots are not always eaten, they are often nibbled, and pieces taken off the bark, so as to cause the resinous sap to run down.

The unsightly appearance and cost of smearing make it of very little use. Extensive plantations are often formed of small trees less than a foot high, and even if there were both time and means to smear the stems of every one of these little trees with one or other of the compounds which some people recommend, the rabbits would still take off the tops and leave the smeared stumps. The idea is absurd from the standpoint of an extensive planter: for 20,000 trees, of the size referred to, do not go far in planting even a small field.

In young plantations, where rabbits and hares abound, there is nothing so effectual as wire-netting until the trees are strong enough and tall enough to be out of the way of their attacks."

FIG. 142.—COLCHICUM—NEW SPECIES (NAT. SIZE): COLOUR OF THE FLOWERS ROSY-RED. (SEE P. 472.)

year it is laden with bunches of glossy red berries. It is well adapted for planting along the edges of game-coverts, as it affords plenty of food for pheasants, which are very fond of the berries. Probably, the more it is exposed to the influence of the sun, the more freely does it produce its beautiful clusters of fruit.

Apocryph of ornamental plants, we may usefully give here, on the recommendation of Sir Herbert Maxwell (*Memories of the Months*, 1897, p. 92), the following list, which, he tells us, contains well-nigh all the ornamental shrubs which may be relied on to defy the attacks of rabbits, although there are others, such as the American Partridge-berry (*Gaultheria*), and several kinds of Barberry, which, if protected when first planted out, can take care of themselves afterwards:—

'Azalea, Rhododendron, Honeysuckle, Fly Honeysuckle (*Lonicera xylosteum*), Tree Peony, Lilac, Syringa, Snowberry, hardy Fuchsia, Spurge Laurel (*Daphne laureola* and *D. Mezereum*), St. John's Wort, Spindlewood (*Euonymus europæus*), Gueldres Rose (*Viburnum Opulus*), Wayfaring Tree (*Viburnum lantana*), Laurustinus, Cotoneaster, Hawthorn, Dogwood, Sea Buckthorn (*Hippophae rhamnoides*), Spiræa, Deutzia, and all kinds of Ribes and Arbutus.'

Before leaving the subject of shrubs suitable for planting where rabbits and hares are numerous, it may not be superfluous to notice some that will thrive under the drip of trees; for this is a matter of some importance in coverts composed of forest trees of large growth with very little underwood. Here it is not a question of food, but shelter, and nothing is more annoying to shooters when walking through such woods 'in lime' than to see all the ground game going forward, just

A writer in the weekly journal, *Woods and Forest*, remarks:—"It is difficult to get two people to agree as to the trees with which rabbits and hares meddle. Some experienced planters say that these animals cut *Pinus laricio* very much if planted small, but do not touch *Pinus austriaca*. Now, as for the latter, I can confidently assert that they cut it more than any other of the Pine tribe. With me they have attacked and thoroughly destroyed fine plants of it 4 or 5 feet high. A neighbour who has planted *Pinus laricio* (I have none except guarded), says that it is "rabbit-proof," and on his assertion I have now planted some hundreds. The fact is, I believe, in a really severe winter, rabbits will attack anything. In a deep snow I have had Yews eaten down, but in the generality of years certain things escape."

Yews cannot be recommended for planting in game coverts, for although the leaves may be eaten with impunity by rabbits, as in the case with goats, it is otherwise with pheasants, several instances having been reported in which these birds have been picked up dead, and found on examination to have their crops filled, or partly filled, with Yew leaves (see the *Field*, November 25, and December 2, 1876; December 20, 1890; September 17, 1892; and November 11, 1893). Death seems to have been due to the action of the poisonous leaves, producing inflammation of the digestive organs; but why well-fed pheasants should sometimes eat Yew leaves, and on other occasions pass them untouched, it is difficult to explain. Shirley mentions a case in which deer were poisoned by eating Yew, at Badminton, in Gloucestershire (*English Deer Parks*, p. 245).

M. Barbier, of Orleans, writing in December, 1892, recom-

We have cited so long an extract that we have little space left for any further comment. It must suffice to say that the author deals fully with such subjects as rabbit-warrens, the employment of ferrets, rabbit-shooting and trapping, poaching, and, what will be novel to most people, the uses of the goshawk. The legal matters connected with the life and death of poor bunny are summarised, so that altogether a very readable book has been produced, and one which will interest the naturalist as much as the "sportsman."

The illustrations are excellent, and a sufficient index adds greatly to the convenience of the reader.

HOME CORRESPONDENCE.

THIBAUDIA ACUMINATA.—A plant of this beautiful, though somewhat neglected, greenhouse shrub, recently came under my notice. Cultivated in a warm greenhouse, it forms a gorgeous object, and blooms during a period of many months. The leaves, when young, are tinged with purple, changing with age to dark green. The soil best adapted for it is a mixture of sandy peat and fibrous loam. *P. B. W.*, Wentworth Gardens.

DESTRUCTIVENESS OF HARES AND RABBITS.

—In taking down an old number of the *Florist*, written in 1849, I was rather amused at an article written by Mr. Thomas Rivers, The Nurseries, Sawbridgeworth, on the damage done by hares and rabbits, and the temporary prevention secured by brimstone, flags, &c., which, after a time, quite failed. He writes to say he has found a sure and certain protection in putting wire-netting around beds, plants, clumps, &c., the wire-netting 2 feet high, and kept 3 inches from the ground, and he describes how it should be fastened. Since that time rabbits and hares must have been educated up to date, for we have here miles of rabbit-netting, 3 feet high, and let into the ground to a depth of 6 inches, and yet the animals dig beneath it very freely, and hares leap over it, and rabbits put their forelegs up and hop over it in the same way. No doubt wire-netting put round plantations is the best remedy if well watched, but it a long way from being perfect. *N. Kneller, Malshanger.*

ERICA MAWEANA x.—Allow me to correct the statement made by Mr. Bean in his interesting article on Hardy Heaths (see p. 454), that Erica Maweana was discovered in 1882. Mr. George Maw discovered this fine Heath in Portugal, when, I do not know, but I have known this plant in cultivation since September, 1873. There is surely very little reason in supposing it to be a hybrid, least of all that Erica Tetralix has had anything to do with it. Its rarity also is not so evident as supposed, as very recently I saw a large quantity of this beautiful Heath in full bloom, and in splendid condition in that "Home for Hardy Heaths," Messrs. Cunningham & Fraser's Nursery, Comely Bank, Edinburgh. *Robert Lindsay, Kaimies Lodge, Murrayfield, late Curator, Royal Botanic Garden, Edinburgh.*

IRIS RETICULATA IN FLOWER.—I had several Roman Hyacinths, also a plant of the beautiful Iris reticulata, in bloom on Christmas-day in the open garden. I have never heard of the latter coming into flower so early before. It is quite a treat to see it at this season of the year. *David R. Williamson.*

OLD BOOKS ON GARDENING.—Your correspondent on p. 461 may like to know that a copy of presumably the same work, bound up with other papers by this writer, was on sale not long since at a London bookseller's, price 25s. There appear to have been two Austens, Ralph and Francis, who discoursed upon fruit-trees, fruits, and flowers between 1631 and 1676. They both resided at Oxford, and were probably brothers. *D. McDonald.*

COS LETTUCE.—Referring to your note on p. 457, in the searches I have made, the Roman Lettuce seems to have been known to the old-time writers as of the cabbage type. Gerard (1597), illustrates the wild Roman, which certainly bears nearest resemblance to a Cabbage Lettuce. Townsend (1726) says, on p. 11, "The Roman is a good Cabbage Lettuce." Switzer (1729), on p. 236, mentions the Roman and other Cabbage Lettuces. Phillips (1812), p. 319, says, "None are so good to boil or stew as the Roman or Cabbage Lettuce." Cos is the name of an island in the Mediterranean, belonging to Turkey, and it was from here that the original type of the upright and close-growing Lettuce as we know it, derives its title. It was first brought to England in 1532, but seems to have been known to the Dutch previously to this; if so, why not also to the French? *D. McDonald.*

RED LIGHT FOR PLANT-CULTURE.—It has long been known that in the action of light, it is the red rays of the solar spectrum which plays the most important part. [?] This is more particularly the case in the chemical processes undergone in the nutrition of the plant. The process involves the doing of work which cannot be done without energy, and the plant cannot evolve the energy required. The exposure of the plant to light is important, in that it avails itself of the kinetic or radiant energy of the sun's rays, and so obtains the energy required for the chemical work which has to be done. That the red rays are the most important is proved by examining with the spectroscopic light which has passed through a solution of chlorophyll, when the absorption-bands in the red are the most conspicuous. This indicates that the red rays are arrested, and converted into another form of energy, which the protoplasm uses for the construction of a molecule. It is reasonable to suppose that rays of light, other than the red, being prevented from exercising their negative properties on the plant, the result would be beneficial to it, and allow it to

grow on undisturbed; hence the result, that in the same given time, the plant grown in a red light would become larger than that exposed to ordinary light. *G. W. Allen.*

A GREAT GRAPE CLASS.—I read with great pleasure the announcement made in the *Gardeners' Chronicle* for Dec. 3, p. 407, that the Shropshire Horticultural Society intend offering £100, in a class for twelve bunches of Grapes, in six varieties, two bunches of each, to be competed for at the Society's show next August, and I note that the writer of the paragraph expresses a hope "that judges will be less influenced by mere size of bunch than by size, finish, and colour of berry." In reference to this grand class for Grapes, a Grape-grower, who signs himself "Exhibitor" in your last issue (p. 424), remarks that "It is most discouraging to exhibitors of evenly-sized bunches, good in berry, and highly finished, to find that the judges have been carried away by mere size of the bunches, and high quality scarcely recognised." And he asks for the views of others on the subject. I have pleasure in giving mine. There cannot be room for doubt in the mind of any Grape-grower and experienced exhibitor as to the manner in which the prizes should be awarded in a class provided for any given number of bunches of Grapes: they should be given to the best all-round bunches of high quality Grapes then in season—that is, to the large, handsomely shaped, even lot of bunches, consisting of large, well-coloured, and properly finished berries. The largest and best-formed bunches, being equal in other respects to smaller and equally well-shaped bunches, should undoubtedly secure premier award. These latter remarks apply separately to first, second, and third class quality Grapes. And should all three be staged—a class for twelve bunches in six varieties, and two bunches of each—the exhibit consisting mostly of the best quality Grapes, and possessing the points indicated above, should be accorded the chief place of honour. I think my meaning will be better understood if I place two exhibits of twelve bunches each in parallel columns.

Bunches.	Points.	Bunches.	Points.

	67		60

Not being able to lay my hand on the Royal Horticultural Society's code of judging scale of points, I have given a maximum number of 6 points to each bunch of Muscat of Alexandria, Madresfield Court, and Muscat Hamburgh, 5 points to Black Alicante, Gros Guillaume, Foster's Seedling, and Buckland Sweetwater, 5½ to Black Hamburgh, and 4½ to Gros Maroc and Gros Coleman, and with the results indicated. Assuming the best possible examples of the several varieties mentioned to be shown, I think Grape-growing exhibitors will agree that the awards in the above two exhibits are fair. *H. W. Ward, Rayleigh, Dec. 12.*

BRISTOL DISTRICT PROPERTY PROTECTION SOCIETY.—"Our Society was commenced in September, 1892, in consequence of raids organised by Bristol 'roughs,' for the purpose of stealing Mushrooms, grown on pasture-land by a farmer of this district, and during one of which a man was fatally injured. We have now 733 members, about 550 of whom are landowners, agriculturists, and market-gardeners, residing in the adjoining counties of Gloucester and Somerset. As the Society has recently become affiliated with the Central Chamber of Agriculture, the Council have instructed me to forward to each of the seventy Societies now supporting that very important organisation, the following copy of a resolution unanimously passed at a Council meeting, held on the 19th ult.: Resolved—"That the Council of this Society heartily endorse the action taken by the Surrey County Council in regard to the urgent necessity of special legislation for the control and regulation of Gipsies and dwellers in tents, vans, and other portable structures; and urges upon all county and district authorities and agricultural societies the importance of actively supporting such proposed legislation by bringing all the influence possible to bear upon the Home Office and members of the Legislature." . . . One of the first resolutions passed by this Society, and which has been sent out to a very large number of County Councils and agricultural societies, is as follows:—"That, inasmuch as the present law of trespass is ineffectual in preventing the wilful trespass which a

certain class of persons in large centres are in the habit of committing over lands in the neighbourhood of such centres, it is desirable that the law should be amplified so as to extend to cases where anyone found trespassing on enclosed lands in pursuit of, or annexing any product of the soil, whether animal or vegetable, shall be guilty of an offence punishable by Justices, sitting in Petty Sessions, and the onus of any exemption or privilege claimed by such trespasser shall be thrown upon him in any proceedings before such Justices." There is a very strong feeling in this district in favour of the general terms of the proposed Bill that a committee of the Central Chamber has prepared, for the amendment of the law in regard to agricultural fences, and which our Council will consider at its next meeting. Agricultural members of our society are strongly advised to plant Mushroom-spawn upon their pasture fields, so that, when necessary, the taking of Mushrooms can be made a criminal offence under the Larceny Act of 1861, 24 & 25 Vict. c. 96, s. 37. The result has been that convictions have been obtained against Mushroom stealers at all the Petty Sessions in this district, and the following strong remarks by Sir Edward Fry (ex-Lord Justice) as Chairman of the Long Ashton Bench of Magistrates on August 27 last, are of much importance. In stating the decision of the Bench, Sir Edward said:—"The practice of stealing cultivated Mushrooms was still carried on to a considerable extent in that neighbourhood. It was well known to everyone who was listening to him that persons had been convicted in that district many times for a similar offence. Farmers had put up notices, and the defendants must have known it. As far as that Bench was concerned, they did not intend to allow that thing to go on. Each of the defendants would have to pay the highest fine they could inflict, 20s., and costs of the prosecution, or in default go to prison for one month's hard labour. If the practice continued, it was the intention of that Bench, as at present advised, in the future not to fine the offenders, but to send them to prison." United and vigorous action upon these subjects throughout the country is imperative, and I feel sure our council will much appreciate your bringing this communication before the notice of your readers, and making me acquainted with the result at your earliest convenience. *James Hunt, Secretary, 39, Broad Street, Bristol.*"

THE ANCIENT VINEYARDS OF ENGLAND.—With reference to the vineyard existing at Warden, Beds, see ante, p. 449, this was the great Cistercian Abbey of De Sartis and the Blessed Virgin at Warden, near Toddington, Bedfordshire, not far from Dunstable. *W. G. S.*

AUCTIONEERS' BOTANY.

The botany of the average auctioneer is a fearful and a wonderful thing. Some of his names are enough to turn an ordinary professor of botany quite green with envy. Occasionally the name of a plant is correctly given, but this is more through the good luck of a stray shot than anything else. Of course, firms like Protheroe & Morris, and J. C. Stevens, are specialists in horticultural matters, so that their technical terms are reasonably correct. The catalogue of a recent important sale held by a well-known London firm of auctioneers, in a country town, has just come into the present writer's hands, and a very curious compilation it is. Capital letters are almost entirely crebowed; there is a beautiful haziness about the lot which comprises "Two dozen flens repens isolepis and others;" but we can grasp the compiler's meaning in "Two bongainvillea Sindrii." A pan of "Arabia sicholdi" is doubtless something new in the way of a seedling, for the genus itself is unknown in our gardens. Doubtless a "rhynchospermum" and six plants of "streptosolen" are as much the manufacture of the printer as of the cataloguer; but the "freessius refracta elba" is obviously due entirely to the genius of the compiler, and we should be the last in the world to rob him of his creation! As there are thirty "lachenalia tricolor," we will assume that the new way of spelling the generic name is adopted as the plural of Lachenalia, and say nothing of the superfluous u in the specific name. From the entry "Two dozen specimen palms, seaforthia elegans," it might be assumed that all Palms are called Seaforthia elegans, which, we believe, is not the case. Ferns, too, are divided into two sections, maidenhair ferns and pteris;

"*Ophiopogon variagata*" is not the usual way of spelling *Ophiopogon Jaburan variegatus*, and in the specific name there is a painful run on the letter a; whilst "*azalea richoldi*" might have been worse.

The compiler of the catalogue of another important sale just held near London goes to the other extreme, and sprinkles the capital letters about in a manner which must have caused the compositor to use very strong language, especially as the catalogue was printed during the recent very hot weather. The Orchids included a *Cattleya Mossica*, a *Cattleya Mosier*, and several other species not yet known to science; whilst one of the lots was thus entered: "Four Orchids—1 *Cattleya Liabata*, 2 *Cattleya*, and 1 *Intermedia*;" and another lot included "2 painters' brush plants," and yet another "1 *Euphorbia Splendens*." A sale held some little time ago at Kensington included a lot made up of "Twelve *Pan-cratum Paysoni*, 1 *Arundinaria Nitida*, and 2 *Dieffenbachia Barsei*;" another lot was made up of "Eighteen *Isolopes Gracilis*," a second of "Twenty-four *Althemanthera*," and another of "Ninety *Madame Voucher*"—the latter presumably *Pelargoniums*; and this presumption may be extended to the lot catalogued as "Forty double red, 50 double white, 5 oak-leaved, and 26 double pink." This extremely indefinite way of cataloguing, however, might let the unwary purchaser in for a good many things he little contemplated. Other curiosities of this catalogue include "six *Epacris*," and "Twelve Ivy-leaved *Geraniums*, *Souvenir de Chas. Tarnar*." Clearly, the budding auctioneer ought to have a course of lessons in botany before he is allowed to ascend the rostrum—or, what is perhaps better, engage a competent person to do his cataloguing. *W. Roberts.*

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending December 24, is furnished from the Meteorological Office:—

"The weather continued very unsettled and rainy in the extreme northern and north-western parts of the kingdom, but elsewhere it was generally fair and dry, and at many of

our southern and south-eastern stations very clear and bright.

"The temperature was considerably lower than of late, but was still above the mean, the excess ranging from 1° in 'England, E.' to 4° in 'Scotland, E.' and 'Ireland, N.' and to 5° in 'Scotland, W.' The highest of the maxima were recorded on the 18th over 'England,' and on the 23rd or 24th over 'Ireland' and 'Scotland,' they varied from 58° in the 'Midland Counties,' and 57° in 'England, E., and S.' to 51° in 'Scotland, N.' The lowest of the minima, which were registered during the middle of the week in the western and northern districts, and towards its close in the English districts, ranged from 2° in 'England, E.,' 25° in the 'Midland Counties,' and 20° in 'England, S.W.' to 31° in 'England, N.W.' and 36° in the 'Channel Islands.'

"The rainfall was again in excess in 'Scotland, N.' and less than the mean elsewhere; in most parts of 'England' and in the 'Channel Islands' the fall was very slight.

"The bright sunshine was deficient over 'Ireland' and in 'Scotland, N.' and just equal to it in 'Scotland, E., and W.' Over England, however, there was an excess, that in most places being large. The percentage of the possible duration ranged from 41 in 'England, E.' 33 in 'England, S., and 35 in 'England, S.W.' to 14 in 'Scotland, E.' 13 in 'Scotland, W.' 8 in 'Ireland, N.' and 7 in 'Scotland, N.'"

COLONIAL NOTES.

FRUIT TREES GUMMING.

I HAVE been much interested of late in your "Answers to Correspondents" regarding gumming in various English-grown fruit trees. Within the last few years a great deal of interest has been aroused in Jamaica in the culture of various Citrus fruits, chiefly through the increased demand caused by the failure of the crop in Florida through frost. This demand has resulted in large numbers of trees being budded, many species of Citrus being used as stock, and all obtainable varieties of the Orange, "Grape-fruit," Lemon, &c., being used as scions. A great deal of manure has been applied, in many instances, to the land under these trees in order to accelerate the growth of the stocks and buds, and in many cases, it must be said, without any thought as to results. In many of the groves the effect of the manure has been to produce luxuriant growth, but in only too many instances this has been followed by the dreaded gumming, which often means the loss of the young trees. Now what I particularly wish to ascertain is, whether the disease is either insecticous or contagious, or both? also, if buds taken from a tree which has shown symptoms of gum, even if taken from a good, healthy branch, is likely to develop gumming at some future period of its growth, although properly treated in regard to drainage, manure, &c. Is it absolutely necessary for the bark to be punctured by some outside agency before a tree can gum? or might not the bark of a tree, being unhealthy, crack, exude gum, and the evil then be accentuated by ants, &c.? These latter are always found in large numbers on Citrus trees when gumming. *W. Cradwick, Supt. H. p. Gardens, Kingston, Jamaica.*

SOCIETY.

WARGRAVE AND DISTRICT GARDENERS'.

DECEMBER 21.—A fortnightly meeting was held on the above date.

Mr. W. H. Scott (gardener to Captain Coleridge) read a very interesting paper on "Hardy Fruit Cultivation," confining his remarks chiefly to Apples and Pears. Mr. Scott recommended landowners to plant fruit trees in their parks, &c. He explained the best method of planting, and, by means of detached shots, illustrated the right and wrong way to prune the trees. Shears and secateurs as instruments to effect fruit-tree pruning were condemned.

Mr. W. Pope (gardener to J. P. White, Esq., The Willows) exhibited a beautiful group of Begonias, "Gloire de Lorraine," which was much admired.

Obituary.

THOMAS SHINGLES.—We regret to have to announce the death, at midnight on the 27th inst., of Mr. Thomas Shingles. He had been head-gardener at Tortworth for 23 years, and succumbed to an attack of apoplexy after an illness of ten days' duration. Mr. Shingles was an occasional correspondent of this journal.

FOREIGN CORRESPONDENCE.

GERMAN S.W. AFRICA.

GERMINATION OF *WELWITSCHIA*.—The seedling I send is eight weeks old. The proportionally long radicle goes straight down without having in this stage, any fibrous roots. The two cotyledons are, when pushing through the surface of the soil, yellowish coral-red and of cartilaginous consistence; two weeks later on, they become glaucous-violet, and are inconspicuously four-ribbed, the ribs dividing into numerous branches at their uppermost part. Between the cotyledons, two small leaflets make their appearance.

As I have provided a number of European gardens with seeds, I beg leave to give here some hints for their raising. In Riviera-gardens the seeds might be sown even at this advanced season (of course under glass), whilst in Central and Northern Europe, it would be better to wait at least until February. I am convinced that the seeds will retain their germinating power for a very long time; not that I have any practical experience on this point, but because the seeds, which ripen at Hailgamechab amidst the dry Namieb, have here in their natural habitat no opportunity for germinating, and are in a dry atmosphere, and exposed the whole year round to the direct rays of the sun; or if the wind has whirled them into small crevices of the granitic rocks they have to support the radiation from the extremely hot rock. I managed to get forty-three strong and healthy seedlings out of ninety seeds in the following manner:—I dressed a square yard of a sandy bed in the garden with a good quantity of rotten goat's dung, and after having put the seeds on the surface, I covered them an inch thick with sand mixed with dung. After two weeks of daily copious watering, the first plantlet made its appearance, and every day since several have shown their red cotyledons. Even now, when the seedlings are already hardened, and begin to show their first pair of leaves, I water them copiously as before, and I can only state that this treatment seems to be perfectly harmless. Of course, the soil in which they grow is very permeable.

For cultivation under glass it would be best to put a single seed into a deep Hyacinth-pot, filled half with rough pieces of granite, and the upper half with fertile but very sandy soil. After the seeds have germinated in a hot and moist temperature, the pots should be transferred to a dry, airy house, such as the succulent or Cape-house.

There is scarcely any doubt that *Welwitschia* in its natural home is one of those plants doomed to disappear in due time, as is probably also the case with *E-tadium latifolium* in the desert behind Linderitz-bucht. They are plants which certainly have once seen quite different climatic conditions. If no one takes the trouble to introduce such curiosities into other countries under conditions that will suit them, they will have the same fate as the giant birds of Madagascar, and the Kinri and Moa of New Zealand.

Can any of your readers tell me whether imported specimens of *Welwitschia* have been already cultivated in Europe successfully, or whether the plant has been raised from seedlings anywhere. *Dinter, Salem* [For figures of the seedling plants of *Welwitschia*, see *Gardeners' Chronicle*, January 7, 1882, pp. 14, 15. Seedlings have been raised in Portugal and France (Antibes). ED.]

CALIFORNIA.

SAXIFRAGA PELTATA.—I was surprised on reading of the gigantic dimensions of the leaves of this species, which your correspondent reports on August 27. I vividly remember how charmed I was with this plant when coming across it in its home in the Sierra Nevada. And yet the largest leaves I admired were barely 18 inches across. Those plants grew in a deep cañon, closely overshadowed by the tops of gigantic Pines. It grows along all running streams from 3500 up to 4500 feet, as far as I have found out on my botanising trips. If on rocky ground and exposed to sun and

occasional drought, the plants are more rhizome than leaf; and the flower-stalks, sometimes 3 feet high, are but 2 to 20 inches tall at such places. It will lay close on to rocks, running like Ivy, and cling to their supports even in the swiftest of currents, and the roughest of spots of the creek bed. Snow falls even at the lowest place (3500 feet) as deep as several feet yet not as a regular occurrence, the less so as the Sierras are fast drying up owing to the destruction of the timber by the cruel axe of the sawmill men. The summer is very warm in these regions, the thermometer rising even to 95° Fahr. The home of this Saxifraga is in the Abies grandis belt, though not in its higher altitudes. Pinus Sabiniana is too low, reaching only to 2500 feet elevation; but Pinus Lambertiana and ponderosa show their grandest development there. It touches the base of the belt of Sequoia gigantea. I trust these notes from the home of this Saxifraga may be of interest to your cultivators of this stranger in your gardens. Geo. Hansen, Berkeley, California.

MARKETS.

COVENT GARDEN, DECEMBER 29.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

	Pines, each 2 0-4 0
	Walnuts, kiln-dried, Naples, 5-cwt. 34 0 —

REMARKS.—On Saturday last a brisk trade was done. All green vegetables were in request, and Brussels Sprouts finished well. As usual, there is a brisk demand, and then a reaction. Pines are down in price to-day; other fruits are about the same. Cobnuts are slow, and have a downward tendency; and home-grown Apples, unless fine, are a very slow trade.

(Remainder of Markets carried forward to p. viii.)

NOTICES TO CORRESPONDENTS.

ADDRESS: B. P. Broadway, Ludgate Hill, London.

ARALIA LEPTOPHYLLA: W. J. C. Cuttings of this species root with difficulty. The better way of increase is to graft one-year old pieces on to stocks of A. Guilfoylei or A. reticulata. If you possess Panax Victorie, you might use it as a stock for A. leptophylla.

BOOKS: H. E. T. *How to Lay Out a Garden*, by Kemp; published by Messrs. Bradbury, Agnew & Co., Ltd., Bouverie Street, E.C. *Landscape Gardening*, by H. E. Milner; published by the author, Dulwich Wood, Norwood, S.E.

MILLER'S "DICTIONARY OF GARDENING," BOUND IN LEATHER, AND IN GOOD CONDITION: B. P. Kindly say which edition you possess. There are eight editions.

RASPBERRY PLANTING AND PRUNING: G. S. For full details of the operation, see our issue for December 17, p. 437.

RIPENING OF FRUITS: B. P. The male and other juices become saccharine under the influence of heat and moisture. We know of no small Handbook dealing with the subject.

SOIL: Subscriber, J. F. The soil, of which you send us a sample, might be useful to mix with loam, but it is certainly unsuitable for exclusive use in potting-up plants. We suppose it has been taken from a peaty bog, as it consists almost entirely of the remains of wood.

TRENCHING LAND: K. There is no implement, steam or other, capable of moving land 3 feet deep, or that can take the place of the spade and manual labour. The first time it is dug, if it be virgin soil or ordinary farm land, the lower spits (two) should be dug and manured and left *in situ*, and the upper spit be laid again at the top over manure, but turned over.

TUBEROSES FAILING TO FLOWER SATISFACTORILY: H. B. We consider the soil sent with the tubers deficient in porosity, and was rammed into the pots too tightly; hence it held within its particles moisture in excess of the needs of the tubers, and the evil was aggravated by the lack of drainage materials. One or two crocks do not form a good means of drainage, and in one case that we examined the infiltrating of the fine soil had stopped the outlet of water. We noted the finely-sifted state of the soil. It is good practice sometimes to sift the manure so as to ensure a fairly even distribution of it through the staple, but not to sift the loam. For Tuberoses the loam should contain all its fibre, supposing it to be to - spit, and it should be hand-broken, not sifted; moreover, it is prudent to pot first in large 60's, and repot into large 48's, or small 32's, when a shift becomes necessary.

VIOLETS NOT SUCCEEDING: E. H. C. The plant sent shows that you have not mastered the art of growing the Violet in frames. It is an aged plant, with numerous side shoots instead of a nine months' old plant, consisting of one crown full of vigour, and furnished with ample foliage and no runners at this stage. We fear they will not repay your trouble in cultivating them. In the month of April, when young runners have pushed forth and taken root round the old plants, take up the whole lot, and select three or four of the strongest runners, preferable those with nice young roots, detach them from the plants from which they have sprung, and having manured with leaf-mould or spent dung a piece of partially-shaded land, plant them out 15 inches apart, not in single line, but in double or triple ones, so that as the season advances the foliage will shade the land, and retain moisture about the plants, and to a certain extent prevent attacks from red-spider. Keep the land clean, apply water when it is getting dry, sprinkle the foliage after hot days, and let no runners develop, but pinch them off whilst quite young. Having done this, you will have strong compact plants, which, if carefully planted in early October in the cold frames, will furnish plenty of blooms in winter and spring according to variety.

WEST-INDIAN FRUIT: T. P. The fruits you have seen in Covent Garden Market are those of *Sechium edule* (see fig. 143), well known in the West-Indian Islands, where they are used by the natives as an article of food. We have many times

FIG. 143. SECHIMUM EDULE (THE CHOW-CHOW).

observed fresh specimens in the market here, and they are sometimes called Chow-chow, Chaco, Chayoto, &c. The fruit is somewhat of the nature of a Vegetable-Marrow, but has firmer flesh, and, in consequence, is more useful for use in pickling. The plant belongs to the Natural Order Cucurbitaceae.
